# THE NEW INTERNATIONAL ENCYCLOPÆDIA

**L**ABOR, AMERICAN FEDERATION OF. A nonsecret confederation of self-governing trade unions in the United States, Canada, Porto Rico, and Panama, comprising five industrial departments: the building trades, metal trade, union label trade, railway employees, and mining. Its paid-up membership increased nearly 300 per cent between 1910 and 1920, from 1,562,112 to 4,078,740; but after 1920 it began to fall and reached 2,926,468 in 1923. The number of local unions in 1914 was 21,430; in 1921, 36,247. Available funds in 1914 amounted to \$366,230 and expenditures to \$265,737; in 1921-22 receipts were \$761,382 and expenses \$562,588. Samuel Gompers continued to hold the presidency, being elected to that position at the 44th annual conference, in 1924, for the 43rd time. During the War the organization made every effort to work with the Government of the United States; every single act of the president and executive council in connection with the War was unanimously approved without discussion. Its loyalty was strengthened by government recognition of trade-union standards and by such appointments as that of Samuel Gompers as an important member of the Committee of Council of National Defense and that of the first vice-president as member of the Commission to the Russian People. This recognition on the part of the government, and to some extent a rise in the cost of living, strengthened the leadership of the Federation during the war period. On the other hand its influence was somewhat weakened in that the Labor Board frequently dealt directly with affected groups, instead of through the central organization of the Federation. Later industrial instability, together with the prevalence of high wages, drew many workers away from the unions. In 1923 efforts were redoubled by the organization of nonunion labor, with much propaganda directed against the open shop.

Throughout the decade 1914-24, the American Federation of Labor held firmly to its policy of nonpartisan political activity. Despite a serious movement beginning in 1918 to form a national labor party, and the election of two United States Senators in one State by the newly organized Farmer-Labor party, the Federation maintained its political activity on the nonpartisan basis of "reward your friends; punish your enemies." In 1924 the Federation leaders wholeheartedly endorsed the candidacy of La Follette. The organization did not abate its hostility toward socialism, syndicalism, the I.

W. W., and other radical labor movements. Although in 1920 the more radical element within the Federation triumphed over the conservative in favor of government ownership and operation of railways, carried on distinct opposition to the conservative administration through 1921, and demonstrated in 1922 over the question of recognition of the Russian Soviet government, the policy of the Federation in 1923 was wholly directed by the conservatives. The radical W. F. Davis had been expelled, the Federation taking the position that "those who seek to destroy the legitimate labor movement must do it from without." In its attitude toward social development through intervention by the State, the Federation likewise maintained its traditional policy. This may be briefly outlined in the Federation's own words, as follows: Laws to protect the helpless, to abolish special privilege and to free industry for the working out of its purely industrial problems, to make government more responsive to the needs of the people and to deprive courts of the power to rule as well as to adjudicate.

Thus the Federation worked for protective laws for women and children, for seamen and for government employees. It supported safety and health measures and adequate workmen's accident insurance legislation. It urged the advance planning of public works as an aid to combating unemployment and the development of a permanent, effective public employment service, though it was hesitant about joining the movement for unemployment insurance, which made substantial gains in the latter part of 1920. It applauded the decision in 1920 of the Kansas Court of Industrial Arbitration in many ways opposed the principle of compulsory arbitration strenuously. A constructive feature of the Federation's policy was its aid to cooperative schemes and its promotion of friendly relations with farmers' organizations. A legal achievement was the clause that Congress put in the Clayton Antitrust Law in 1914, a recognition of the principle that the labor of a human being is not a commodity or article of commerce, thus a guarantee of certain rights in connection with labor organization and the use of boycott. Among the measures of broad import advocated by the Federation were restriction of immigration; gradual reduction of army and navy; regulation of large industries; extension of popular control of government; limitation of the power of the Supreme Court and an amendment to the Volstead Act preventing the manufacture and sale of beer. It

ested against the ship subsidy bill and military education in the schools. It expressed an unfavorable opinion of the Ku Klux Klan as an unconstitutional organization and a detriment to labor and declared against the alleged discrimination against Jews at Harvard, although after an investigation the Federation held that such discrimination was nonexistent. In connection with negro labor, an effort was made to prevent the drawing of a color line, and a special organizer was sent to work among the negroes in the South. The Federation officially declared its sympathy with India and Ireland; it favored the entrance of the United States into the League of Nations and the World Court.

Although the Federation sent no representative to the Inter-Allied Labor Conference at London in 1918 or to the conference in Berne after the Armistice, although its proposition for an inter-Allied labor conference at Paris was not accepted, and although it could not be officially represented at the meeting of the Labor Department of the League of Nations at Washington in 1919, its international relations widened appreciably during these years. In 1916 steps were taken to cultivate friendly relations with organized labor in Mexico, South America and Japan. A Pan-American Federation of Labor Conference Committee was created in that year. In 1918 small groups were sent to Europe to confer unofficially with organized labor in Allied countries, and in 1919 the Federation was represented at the International Trade Union Conference in Amsterdam. While the peace terms were under discussion, the Federation formulated its official attitude on the matter; this was based largely on the declaration of President Wilson, which included in its suggestions that the treaty bar from shipment in international commerce all products involving the labor of children under 16 and that it declare for the basic standard of an 8-hour day. In 1923, affiliation with the International Federation of Trade Unions was strongly recommended.

**LABOR ARBITRATION.** The decade after 1914 witnessed an increased recognition of the imperative necessity of applying methods of arbitration and conciliation to industrial disputes. Concentrated efforts were made during that period to prevent by the wider use of arbitration the harmful effects of strikes, lockouts and other violent means of settling industrial disputes, and, although many attempts were made, there were marked advances toward industrial peace. Public opinion at least was awakened to the undeniable desirability of substitution of peaceful action for violence. The more complex nature of industrial disputes in the later years, the importance of uninterrupted production during the War, the larger organization and the increased sense of power of the trade unions, the unsettled industrial conditions after the War and the growing unrest, the growing demands on the part of the workers, the steadily increasing specialization and interconnection of industries, all tended to bring about a realization of the effectiveness of labor arbitration. This realization found expression not only in governmental action, but also in numerous attempts on the part of employers and employees to find a *modus vivendi* in industry. Thus the decade was characterized by a constantly increasing number of trade union agreements making pro-

vision for various methods of conciliation.

**The United States.** During 1914 a number of serious strikes and labor disputes were successfully settled by arbitration. The most important event of that year in arbitration legislation was the enactment by Alaska of an elaborate law relating to the adjustment of trade disputes. In 1915, a year of many strikes, the Department of Labor offered its services as mediator in 32 labor controversies, of which 24 were amicably settled, the most important being the Western Railroad case. In the same year, Colorado passed a law setting up an industrial commission with wide powers to arbitrate. John D. Rockefeller, Jr., advanced his Industrial Representation Plan, a comprehensive scheme for the handling of all relations between employers and employees. Of far-reaching importance was the effective trade agreement made in the New York clothing industry, whereby a two years' peace was established. The year 1916 brought an increase in sentiment for the amicable settlement of labor disputes, which was manifested in the various attempts to terminate by arbitration the troublesome strikes and conflicts of that year, and in the arbitration machinery agreed upon between the Boston Elevated Railroad Company and its employees, and in another case between the Hart, Schaffner and Marx Company in Chicago and the Amalgamated Clothing Workers. But the most notable event of the year was the passage by Congress of the Adamson Eight Hour Law. After unsuccessful attempts at arbitrating the disputes which threatened to bring about a strike of the four railroad brotherhoods, a law was passed providing that after Jan. 1, 1917, "eight hours shall, in contracts for labor and service, be deemed as a day's work," and empowering the President to appoint a commission of three to investigate for a period of six years the workings of the law. Opponents of the Adamson Law criticized it as being a result of intimidation by the brotherhoods and as imperiling the principle of arbitration. On Dec. 5, 1916, President Wilson made a plea for full public investigation of industrial disputes as an effective means for the prevention of strikes. With the entrance of the United States into the War, prevention of labor disputes became especially urgent and a labor policy toward that end was entered upon by the government. As a consequence, the Committee on Labor of the Advisory Commission of the Council of National Defense began in June, 1917, the establishment of local committees of mediation and conciliation, composed of representatives of the employers, the workers, and the general public. In August of the same year an important agreement was reached between the government and the international unions engaged in American shipyards. Under this compact a National Board of Adjustment was created as the final arbiter as to wages, hours, and conditions of work, and the unions agreed not to strike as long as the agreement was in force. The final step of the government in the prevention of strikes was the creation of a National War Labor Board in April, 1918. The functions of this board were to be: to bring about the settlement of labor disputes by mediation and conciliation in all industries essential to the effective conduct of the War, to establish the necessary machinery for this purpose, and in case of failure of local mediation to carry on

the arbitration themselves. The board to be composed of five representatives of employers' organizations, five of the A. F. L., and two impartial chairmen, one for employers and the other for the workers. The board served successfully as a means of settling disturbing labor troubles during the War. The year 1918 saw also the Altschuler award the Chicago packing industry, which provided machinery for the settlement of grievances under which the workers bound themselves to strike pending the attempts at peaceful settlement of their disputes. The very serious industrial troubles which broke out after the Armistice led to the calling by President Wilson of the First Industrial Conference on Oct. 6, 1919, for the purpose of considering the fundamental means of bettering the whole relationship between capital and labor. After its first meeting the Second Industrial Conference was held, which presented on Dec. 28, 1919, a plan proposing the establishment of a National Industrial Tribunal and of Regional Boards of Inquiry and Adjustment. On Mar. 1, 1919, the conference issued its final report, in which it recommended as the best means for the prevention of industrial conflicts such agencies as had already been established in various trades; namely, shop committees and councils, work councils, etc., and in case these failed, adjustment by the above-mentioned boards. The programme of the conference did not, however, find practical application, although mediation through the government had proved rather successful during the War. Arbitration was resorted to with satisfactory results in a number of important disputes during 1921. A case in the packing industry was adjusted by a conference in Washington of the representatives of the employers and employees and the Secretary of Labor. The executive council of the International Typographical Union decided to maintain arbitration in the printing industry in New York and to submit its wage disputes to arbitration. In Jan. 1, 1921, the Pennsylvania Railroad system set up a joint reviewing committee "for the amicable settlement, by joint conference, of all controversial questions affecting the engine and train service men." A Court of Industrial Relations on the principle of compulsory arbitration was created in Kansas, in 1920. The court affected a number of industries and was composed of three judges appointed by the government. It was given wide powers, such as to make reasonable awards, investigate industrial conditions, bring suit in the Supreme Court of the State to enforce obedience to its orders, and to take over and run industries in case of emergency and limitation or actual suspension of production. Organized labor was strongly opposed to the court and serious difficulties arose from the conflict between the court and the trade unions in the State. In 1923, the United States Supreme Court unanimously held wage fixing by the Kansas court to be unconstitutional. (See KANSAS.) Machinery for the adjustment of labor disputes on the railroads was set up under the Transportation Act which was passed by Congress in February, 1920. The act provided for the settlement of controversies and grievances between the railroad workers and the managements by the establishment of the United States Railroad Labor Board, which is composed of nine members, a third appointed by the President. The Board attempted unsuccessfully

to arbitrate in the great strike of the railway shopmen in 1922. Perhaps the most comprehensive means for the peaceful settlement of industrial disputes existed in the agreements between the Amalgamated Clothing Workers and the clothing manufacturers. Especially notable here is the Trade Board established in Chicago, consisting of two representatives of the union, two of the employers, and an impartial chairman. Practically all the decisions rest virtually with the chairman.

**Great Britain.** Due to the powerful organization of British labor, methods of arbitration have progressed further in Great Britain than in the United States. A great advance was made in the former country by the establishment of the Industrial Council, which was composed of 13 representatives of the employers, an equal number of representatives of the workmen, and Sir George Askwith as impartial chairman. The latter arbitrated in 1914 the strike of the unskilled workers near Birmingham. At the Treasury Conference of 1915, the trade union officials and the government concluded an agreement for the purpose of regulating the relations between employers and workers for the duration of the War. The compact stipulated that all disputes should be settled by conference between the parties or, in case they failed to agree, by three other possible means of arbitration. The miners were the only ones who remained outside of this pact. The Treasury Agreement, however, did not prevent serious unofficial strikes during the remainder of the War. The establishment of the Joint Industrial Councils during the latter part of the War and immediately after the Armistice served effectively to preserve industrial peace in a great number of trades. Probably the most important measure, however, regarding the relations between capital and labor was the Industrial Courts Act of 1918. It created a standing Industrial Court, composed of independent persons and representatives of the employer and employees, all of them appointed by the government. The court is a permanent industrial tribunal and as such has settled a great number of disputes by making awards, the most important of which was the Dockers' Court of Inquiry early in 1920. Although the court has no power to compel compliance with its decisions, the number of awards repudiated by the losing side has been negligible. The most momentous single arbitration case in Great Britain was the Coal Commission of March, 1919, which was set up on the demand of the miners for the six-hour day, higher wages, etc. It consisted of six representatives of the miners, six of the mine owners, and an impartial chairman, and dealt with wages, hours, and nationalization of mines. The interim report on wages and hours was published in three parts. The part that called for the seven-hour day, and which was signed by the chairman and three representatives of the employers, was adopted by the government. None of the reports on nationalization were put into effect. It may be said that with the trade boards, the Industrial Court, and the joint industrial councils, Great Britain had three effective agencies for the prevention of industrial disputes by arbitration. See STRIKES AND LOCKOUTS.

**LABOR BANKS, UNITED STATES.** That extension of the principle of coöperation (q.v.) which led to the establishment by labor of co-

<sup>a</sup> Includes undivided profits.

<sup>b</sup> Included with surplus.

<sup>c</sup> Has branches at Barstow and Needles, Cal. According to the *Labor News* (Eureka, Cal.) Jan. 19, 1924, this bank plans to build up a chain of banks throughout the State.

<sup>d</sup> No data available.

<sup>e</sup> Bank has received its charter.

<sup>f</sup> The *Leather Workers' Journal*, May, 1924, p. 106, states that this bank is officered by union labor.

<sup>g</sup> The April number of the *Brotherhood of Locomotive Firemen and Enginemen's Magazine* states (p. 180) that this bank was to open its doors about April, 5, 1924. Charter granted.

this country to be owned and controlled by a labor organization was the Mt. Vernon Savings Bank, Washington, D. C. (1920). In that year also, the Brotherhood of Locomotive Engineers founded at Cleveland, Ohio, what was then said to be the only national bank in which depositors shared earnings. The success of this considerable venture (in 1924 it still had the largest total resources of any single labor bank in the United States) stimulated the establishment of similar institutions. The rapid expansion of the movement in the succeeding years is shown by the accompanying table, from the *Monthly*

The labor bank is distinguished from the ordinary commercial bank chiefly in that (1) it is owned and controlled by labor; (2) it limits the dividend payable to stockholders to 10 per cent; (3) it pays a higher rate of interest on deposits (generally 4 per cent on savings, and 2 per cent on checking accounts above \$500), and computes interest from the first day; and (4) it pays to the depositor, over and above interest, dividends from its net earnings. The labor bank is chartered in the regular way, under State or Federal laws, and is subject to the usual strict examination. Control rests

with the labor union (or unions) and its membership: (a) through possession of the majority of the voting stock of the bank; and (b) through union officials and other men in sympathy with labor, who constitute the majority of the officers and board of directors. The labor union itself as an organization operates the bank, assuming the usual financial liability to depositors. Business and administrative affairs are in the hands of experienced bankers, acting with the trade union officials. The fact that labor leaders in the banks were not only legally responsible as bank officials but were also responsible to the labor organizations, made for unusual care in choosing competent bankers to administer affairs, and so for conservative policies. The temptation to take risks was further lessened by the limitation on the number of shares to be owned by an individual, usually to three. Without any known exception, labor banks up to 1924 were having considerable financial success. Notwithstanding the limitation on dividends, the market value of labor-bank stocks was above par.

In addition to offering unusual advantages to the depositors and stockholders, the labor bank was a source of strength to the trade union. For one thing, it earned for the union, on its defense and insurance funds, a profit in excess of the interest that these funds ordinarily drew from commercial banks; and not only was it able to supply funds for the sound enterprises of other unions or coöperatives which might otherwise be left unaided, it was in a position to discriminate in granting its loans between employers who were favorable and those who were unfriendly to labor. Moreover, the existence of the labor bank weakened the pressure that commercial banks might exert on individual employers during strikes, by withholding credit. A number of the labor banks were depositories of State and city governments and members of the Federal Reserve system. By the close of 1923, the sum total of labor-bank resources in the United States (exclusive of the Brotherhood Investment Company) was estimated by the *American Labor Year Book* at approximately \$50,000,000. The Brotherhood Investment Company, with a capitalization stock of \$10,000,000, was chartered in 1922 for the purpose of buying and holding stocks of banks and trust companies, and dealing in high-grade investment securities. This institution, because of the scope of its activities, could participate in large-scale financial operations. Although about 20 per cent of its stock was in the hands of other than workingmen, the Brotherhood of Locomotive Engineers as an organization was in possession of 51 per cent of the voting stock.

**LABOR LEGISLATION.** Although America's first labor law was enacted 88 years ago, when Massachusetts set up an educational requirement for working children, and although the development has continued steadily since that time, by far the greater part of effective labor legislation is the fruit of the past decade (1914-24).

A significant forward step is the constitutional amendment recently passed by Congress which, if it is accepted by three-fourths of the States, will make it possible for that body to enact laws regulating child labor throughout the country. This came after two attempts of the Federal legislature to restrict the labor of

children, both of which were declared unconstitutional by the Supreme Court (see CHILD LABOR).

There are now eight more laws than there were in 1914 (making a total of 15), which either fix a minimum standard of wages for children and women or provide for the setting of such a standard. These laws have been passing through a period of economic trial and judicial test somewhat like that which marked the path of the early hour legislation. In fact, the constitutionality of even the Massachusetts law—which makes no compulsion but calls only for the publication of the names of those employers who do not comply with it—has recently been attacked by a Massachusetts court (see MINIMUM WAGE). There has also been progress in the regulation of the form and method of wage payments and establishment of wage preferences and mechanics' liens.

During the decade, 25 additional States, Porto Rico and the District of Columbia, have limited the number of hours that women may work or have prohibited night work, while many of the older laws have been made more stringent and more definitely enforceable. There are now only four States in the country—Alabama, Florida, Iowa, and West Virginia—that have no law whatever to regulate the hours of work for women (see HOURS OF LABOR and WOMEN IN INDUSTRY). Legal regulation of men's working hours has by no means been confined to public works and public utilities—although during the past decade many laws have been passed regarding hours in public employments. Legislation limiting the hours of men in dangerous private employments has made a considerable advance. Oregon has recently moved on to the eight-hour day in the lumbering industry, but with a reciprocal provision that the new law goes into effect only after adjoining States have adopted the same restriction (see HOURS OF LABOR).

The first accident-reporting law dates from 1886, but most of the scientific gathering of accident statistics is the work of the past decade. The first law requiring safety devices in factories was adopted in 1887, but it is only within about 10 years that universal progress has come in accident prevention. Mining codes have also been enacted or improved, while during the year 1924, the Industrial Commission of Utah, after a mine explosion at Castle Gate which took 172 lives, adopted a set of mine safety regulations unique in its comprehensiveness and in its application of the best thought on the subject. Much public interest in industrial hygiene was manifested in the year immediately following 1910, but since 1914 most of the States have adopted new regulations of factory sanitation and ventilation or improved their former laws.

The past decade saw the successful operation of a Federal Employment Service for about a year and a half during the War, and a subsequent decline in its effectiveness through enormously reduced appropriations. It has witnessed as well the establishment of many State public employment services and a considerable development in the regulation of private fee-charging bureaus. Three States, by specific law, have officially recognized the importance of long-range planning of public works to provide employment in periods of business depression (see UNEMPLOYMENT).

Another important development during the last 10 years is the advance in legislation providing accident compensation for those injured in the course of employment. Since 1914, 22 State compensation laws have been enacted, and most of the older laws of the country have been liberalized in one way or another since they were originally passed (see WORKMEN'S COMPENSATION). In addition, 36 States have, within four years, voted to cooperate with the Federal government in the vocational retraining of industrial cripples.

As an outgrowth of the same social spirit within the past year, pioneer legislation in three States has established old age pensions. (See OLD AGE PENSIONS.) Mothers' pension systems are now in operation in 43 States and Territories while 40 States have accepted the Federal appropriation for maternity protection offered by the Sheppard-Towner Act of 1921. See MOTHERS' PENSIONS and MATERNITY PROTECTION.

The legislation affecting collective bargaining has not been of great importance. The power of the Kansas Court of Industrial Relations compulsorily to arbitrate conflicts between employers and employees was practically annulled by a recent United States Supreme Court decision. (See LABOR ARBITRATION.) A number of States during the War and shortly after enacted laws defining and penalizing criminal syndicalism and sabotage; but several States also officially recognized trade unions and declared human labor is "not a commodity." See TRUSTS.

One of the outstanding developments of the decade has been in the field of labor law enforcement and administration. All States now have some provision for the special administration of labor legislation, while most of them have some central body for the purpose. In five States, industrial commissions modeled after that of Wisconsin not only enforce the labor law but issue orders which have the compulsion of law, after the Legislature has laid down the general principles which the regulations are to follow. An industrial commission, which also makes constant investigations, is in a far better position to determine the detailed application of a statute than is a body of miscellaneous legislators meeting but once in two years.

The principal hindrances to labor legislation in the past have been (1) the opposition of business interests; (2) the after-war reaction, and (3) adverse court decisions. Fourteen times during the past 10 years, the United States Supreme Court has decided cases affecting labor by four-to-five or by four-to-four decisions.

Helpful influences in labor legislation include (1) the more general spread of knowledge of the need and practicability of legal protection; (2) the development of effective scientific propaganda organizations such as the Consumers' League, the Child Labor Committee and the American Association for Labor Legislation; (3) the more active participation of women in public activities; and (4) the application of Federal-State financial cooperation which had within three years led to the adoption of vocational rehabilitation of industrial cripples by three-fourths of the States and the rapid extension of maternity protection in an even greater number of jurisdictions.

A brief survey is sufficient to show how modern indeed is most of our labor legislation.

Probably all of it is in need of improvement today, but considering the rapidity with which fundamental changes in legislation have spread over the country during the past 10 years the prospect seems favorable for future advances wherever the need is clear and the opportunities for public enlightenment are available. See IMMIGRATION.

**Supreme Court Decisions.** Decisions by the United States Supreme Court have shown an increasing tendency to overrule legislation for the protection of labor and to curtail labor's organized activities. In the later years many important decisions were handed down by a closely divided court. A survey made by the United States Bureau of Labor Statistics of the decisions by the Supreme Court, in which cases affecting labor were involved, disclosed the fact that within 40 years there had been 21 cases decided by a vote of four to five or four to four; 13 of these, or nearly two-thirds of the total, falling within the last 10 years. It appeared that members of the Court were with increasing frequency unable to agree as to whether or not an act of legislation is "plainly and palpably, beyond all question, in violation of the fundamental law of the Constitution."

Many of the Court's decisions in the early years of the decade 1914-24 were favorable to labor, particularly in the field of protective legislation, but in the later few years measures of far-reaching importance to the welfare of wage-earning men and women were nullified by the opinions of a bare majority of the court.

Perhaps the most important favorable decisions of the Supreme Court during this period were those in favor of the constitutionality of workmen's compensation laws. In giving its final assent to this form of protective legislation the Court took the advanced ground of upholding laws providing for compulsory and exclusive State funds for workmen's accident insurance. In its decision sustaining the 10-hour day for factory employees in Oregon the court for the first time recognized the power of a State to enact laws limiting the hours of work of men in private employments as well as of women and children. In the Adamson eight-hour law decision of 1917 the court held that Congress had the power to limit the number of hours to eight for trainmen engaged in interstate commerce. A New York law prohibiting night work of women in restaurants was upheld as was also a law of Oregon establishing a minimum wage for women and minors (see MINIMUM WAGE).

On the other hand, the Supreme Court in a third dividend decision finally blocked the efforts of Congress to provide accident compensation for longshoremen and other local harbor workers under State laws. In two decisions it nullified attempts by Congress to abolish child labor (see CHILD LABOR) and in another later decision which aroused widespread interest it declared unconstitutional a Federal law providing a minimum wage for women and children in the District of Columbia.

Among the important decisions of the Supreme Court which tended to weaken organized labor in the field of collective bargaining were those in the so-called Danbury hatters' and Arkansas coal miners' cases which established the principle that labor unions and their individual members are responsible, without limit, for

the unlawful actions of the union officers and agents which they have in any manner authorized or sanctioned; the *Coppage vs. Kansas* decision which declared unconstitutional a State statute aimed to prevent an employer from forcing his employee to agree not to join a trade union during his term of service; the *Hitchman Coal and Coke Company vs. Mitchell* decision which held that where an employer has compelled all of his employees to sign a contract that they will not join any labor union, it is illegal to make any effort to organize them; the *Duplex Printing Company* decision in which the court clearly distinguished for the first time between "primary" and "secondary" boycotts, and declared that the Clayton amendment to the Sherman Antitrust law had not legalized the secondary form; the *United Mine Workers of America vs. Coronado Coal Company* decision in 1922 which held that trade unions are suable in their own names—the first case of importance in America permitting a suit against an unincorporated union.

The fact that an increasing number of far-reaching decisions of the Supreme Court in cases affecting labor had checked protective legislation and trade union activities—and had been handed down by a closely divided court—made a political issue of the contention that the Court is the chief obstacle to social progress in America and that action should be taken by Congress to limit the power of the Court to pass upon the constitutionality of laws. See *LAW, PROGRESS OF THE*.

**LABOR OFFICE, INTERNATIONAL.** See *LABOR ORGANIZATION, INTERNATIONAL*.

**LABOR ORGANIZATION, INTERNATIONAL.** One of the most significant and novel features of the Paris peace settlement of 1919 was the incorporation as Part XIII of the Treaty of Versailles of a special Labor Convention setting forth a charter of principles for labor legislation and providing for the establishment of a permanent International Labor Organization. This labor section of the treaty represented a signal triumph for the cause both of internationalism and of labor. A commission on international labor legislation, with 15 members including such prominent leaders as Samuel Gompers, the Anglo-Jewish president of the American Federation of Labor, and Vandervelde, the patriotic Belgian Socialist, was appointed by the Peace Conference in January, 1919, to formulate suitable treaty provisions for labor welfare and unemployment. The Commission made its report on March 24. Following detailed consideration and revision by the Council of Four, this report was adopted on April 11. It consisted of two parts, one creating a permanent organization for international labor legislation and the second enunciating a veritable bill of rights for labor. Recognizing that the existence in the various countries of special circumstances arising from differences of climate, habits, and customs of economic opportunity and industrial tradition made strict uniformity in the conditions of labor difficult of immediate attainment, the essential methods and principles were affirmed to be: (1) consideration of labor not as a commodity; (2) right of association for lawful purposes for both employers and employees; (3) payment of a wage adequate to maintain a reasonable standard of life; (4) adoption of an 8-hour day or 48-hour week; (5) adoption of a weekly

rest of at least 24 hours, including Sunday whenever practicable; (6) abolition of child labor and continuation of the education and proper physical development of children; (7) equal remuneration for men and women for work of equal value; (8) equitable treatment in every country of all workers lawfully resident therein; and (9) adequate systems of inspection in which women should participate, to insure enforcement of protective regulations. These aims and purposes were sanctioned in the League of Nations Covenant (Article XXIII, Section A).

The machinery of the International Labor Organization as created by the Convention embraced two major organs, a periodic International Labor Conference and a permanent International Labor Office. The Conference, composed of four delegates from each member-state, two appointed by the government and one each by the most representative organizations of employees and workmen respectively, was to meet at least once a year, to consider labor problems, to discuss standards of labor welfare, to debate feasible measures for the attainment and maintenance of these standards, and to formulate decisions either as conventions for ratification or rejection by the national parliaments of the world, or as recommendations to be submitted to and considered by these national parliaments or local legislatures. These conventions might then be executed by means of appropriate domestic legislation. Up to July, 1924, the Labor Conference had met six times. The first meeting was held at Washington, D. C., Oct. 29–Nov. 29, 1919. Though the United States was not officially represented, 121 delegates from 39 other countries were in attendance. Germany and Austria were admitted to membership by a vote of 71 to 1. Six draft conventions and six recommendations were adopted; the most noteworthy achievement was an 8-hour day convention. The other conventions dealt with unemployment, care of female workers in industry before and after childbirth, prohibition of nocturnal employment of women in industry, prescription of a minimum age of admission of children to employment, and the prohibition of night employment for children under 18. The second session was held at Genoa, Italy, in June, 1920, when 27 nations were represented by specialists competent to deal with conditions of maritime labor. Three conventions were adopted, dealing with seamen's employment agencies, payment of unemployment insurance in cases of shipwreck, and prescription of a minimum age of 14 years for employment of boys at sea; recommendations were also made on unemployment insurance, enactment of national seamen's codes, and regulation of hours of work in the piscatorial industry and inland navigation. A Permanent Joint Maritime Commission was constituted to further the work of improving maritime labor conditions. The third session of the Labor Conference held at Geneva, Switzerland, during October, 1921, dealt mainly with problems of agricultural labor. Strenuous French objections to any consideration of these problems as alien to the jurisdiction of the Labor Organization were overruled and subsequently the Permanent Court of International Justice at its first session in July, 1922, definitely established the competence of the Conference. A whole series of conventions and recommendations were adopted dealing with

labor in general and specifically extending to agriculture. Legislation had hitherto been restricted rather narrowly to urban industrial labor. These 1922 measures included limitation of hours of labor, unemployment insurance, improvement of working conditions, and protection of women and children. The fourth annual meeting, at Geneva in October, 1922, adopted a recommendation calling for more adequate and accessible information regarding transit and migration of persons from one country to another. Also adopted for submission to the League of Nations was an amendment to Article 393 of the Treaty of Versailles; it elaborated and liberalized somewhat the governing body thereby set up to control the International Labor Office. The fifth session, held in October, 1923, was principally concerned with the general principles of the organization of factory inspection. At the sixth session, in June, 1924, great satisfaction was expressed at the steadily improving industrial conditions of Europe.

The International Labor Office was subjected to the control of a governing body of 24 members appointed annually by the International Labor Conference; the 1922 amendment had proposed a body of 32 triennially selected members at least 12 of whom should be non-European. This body had the functions, first, of preparing the agenda of the Conference; secondly, of conducting the correspondence and negotiations involved in the execution of its decisions; and thirdly, of making technical investigations and collecting and disseminating general information about labor conditions in all parts of the world. Organized first at London in January, 1920, the Labor Office was in July, 1920, transferred to the seat of the League of Nations at Geneva; for the Labor Organization, although autonomous, was placed under the aegis of the League and was to be supported financially by grants of money made by the League Assembly. The first director of the Labor Office was Albert Thomas, the French Socialist and labor leader, who had been an exceedingly capable Minister of Munitions during the War. Under his able supervision an administrative staff of some 350 experts, men and women from 28 countries, was recruited and trained.

**LABOR ORGANIZATIONS.** See **TRADE UNIONISM**.

**LABOR PARTY, AUSTRALIAN.** See **AUSTRALIA**.

**LABOR PARTY, BRITISH.** See **GREAT BRITAIN**; **SOCIALISM, Great Britain**.

**LABRADOR.** A dependency of Newfoundland, and the most easterly part of the British North American mainland; area, 120,000 square miles; population, 3621 in 1921, as compared with 3965 in 1913. The leading activities of the population, mostly Eskimos and Indians with some whites, continued to be the fisheries and fur trapping. The Revillon Company appeared during the period to contest the supremacy of the Hudson's Bay Company in the field. The Grenfell Mission among the whites, and the Moravian Brethren among the Eskimos to the north, continued to make life supportable for the population. An attempt was made toward the settlement of the long-outstanding boundary dispute between Canada and Newfoundland in this region by the decision on the part of both governments in 1920 to submit the matter to the British Privy Council. A survey commission in December, 1920, revealed the importance

of the contested region by the discovery of rich forest lands and mineral areas.

**LADD, ANNA COLEMAN (MRS. MAYNARD LADD)** (1878- ). An American sculptor, born in Philadelphia, Pa., who studied in Paris and Rome and in 1915 was elected an associate member of the National Society of Sculptors. One of her masters was Charles Grafty, an able technician. In most of her figures, Mrs. Ladd is concerned with the proper disposition of light by means of the modeling. Her work has strength and originality, and her preference is for imaginative subjects. She has, however, executed many successful portrait busts and bas-reliefs. Among her sculptures are: the "Spirit of Serbia," exhibited at the Rhode Island School of Design, "Bronze Lady," at the Gardner Collection, Boston, "Wind and Spray," in the Borghese Collection at Rome and the fountains in the Boston Public Gardens. During 1918, Mrs. Ladd conducted a studio in France for portrait masks for mutilated soldiers.

**LAESSLE, ALBERT** (1877- ). An American sculptor, born in Philadelphia, Pa., who studied at the Spring Garden Institute, Drexel Institute and the Pennsylvania Academy of Fine Arts. He was a pupil of Charles Grafty and studied in Paris with Michel Béquine. He is best known for his studies of animal life, of which good examples are to be found in the Pennsylvania Academy of Fine Arts where three of his sculptures, "Turtle and Lizards," "Blue-Eyed Lizard," and "Chanticleer" are to be found. At the Carnegie Institute, Pittsburgh, his study, "Heron and Fish," is on exhibition. Other examples of his work are "Victory" and "Turning Turtle" at the Metropolitan Museum, New York, "Penguins" at the Philadelphia Zoölogical Gardens, "The Bronze Turkey" and "Billy" at the Philadelphia Art Club, and three small bronzes, "An Outcast," "Locust and Pine Cone" and "Frog and Katydid" at the Peabody Institute, Baltimore.

**LA FARGE, CHRISTOPHER GRANT** (1862- ). An American architect (see Vol. XIII). From 1910 to 1915 he was a member of the firm of La Farge and Morris, and in 1918 became investigator and later assistant general manager of the United States Housing Corporation in Washington. He was an Associate of the National Academy and was former president of the Architectural League of New York. He was also a member of the Advisory Board of the School of Architecture of Princeton University and of the Advisory Council of the School of Architecture of the Massachusetts Institute of Technology. He was made honorary M. F. A. by Princeton in 1921.

**LAFAYETTE COLLEGE.** A college and school of engineering for men at Easton, Pa., founded in 1826. The institution grew steadily during the decade 1914-24, with an enrollment of 580 at the beginning of that time as compared with 970 at the close, a faculty of 50 members as compared with 80 in 1923-24, and a library of 30,000 volumes as compared with 57,000 volumes. The productive funds were increased from \$770,960 in 1917 to \$2,000,000 in 1923-24, largely through a \$1,000,000 endowment campaign in 1920; and the Helen H. P. Manson chair of Biblical literature, the Fred Morgan Kirby professorship of civil rights, the Simon Cameron Long professorship of civil engineering, and the John D. and Frances H.

Larkin professorship in chemistry were endowed during the period. Nine acres were added to the campus in 1922, and a new gymnasium costing \$325,000 was completed in 1924, as a memorial to Lafayette men in the War. President, John Henry MacCracken, Ph.D., LL.D.

**LA FOLLETTE, ROBERT MARION** (1855- ). United States Senator from Wisconsin (see VOL. XIII). He was reelected successively from 1910 to 1923, and during that entire period dominated the Republican party in Wisconsin. He actively opposed, in 1916-17, all war preparations, and an attempt was made by the legislature of Wisconsin to deprive him of his office as Senator (see WISCONSIN). In spite of these efforts, he was reelected. Although he was absent from the Senate on account of illness for a large portion of the time in the latter part of the decade, his influence in the Senate continued to be great. In 1922, 1923 and 1924 he was able, by his control of so-called blocs in both the Senate and the House, to decisively affect the functioning of those bodies. In the Senate he controlled a group of members from the Western States who, in 1923-24, on account of the small margin between the Republican and Democratic membership, held the balance of power, and was able to affect legislation, to a large extent. This was true also in the House, where the Republican Representatives, from Wisconsin and other States, who were controlled by him were able, by combining with the Democratic party, to overthrow attempts of the Republican majority to pass important measures and to modify others. In 1924, he announced his candidacy for the presidency on an independent ticket. He had previously organized a so-called Conference for Progressive Political Action, composed chiefly of insurgent Republicans and Democrats and some members of the Farmer-Labor party. At a convention in Cleveland, in July, 1924, he was nominated for President. He also received the nomination of the Socialist party, although he had never been identified with Socialism. See UNITED STATES, *History*.

**LA FOLLETTE SEAMEN'S ACT.** See SHIPPING.

**LAGERLÖF, (OTTLA LOUISA) SELMA** (1858- ). A Swedish novelist (see VOL. XIII) ranked among the greatest writers of her country. She took an active interest in communal affairs and served as member of the municipal council in her native county, Värmland, where with the aid of the Nobel Prize, she realized the dream of her life by restoring the ancestral estate. After 1914 she published: *Astrid* (1914); *Dunnungen*, a comedy (1914); *Stenen i sjön Rotenen* (1914); *En Emigrant* (1915); *Silvergrievan* (1915); *Drinman* (1916); *Her Bannlyst* (1918), known in the English translation as *The Outcast* (1920); *En saga oom en saga och andre sagor* (1919); *Ingmarssönerna* (1919); *Zacharias Topelius* (1920).

**LAHM, FRANK P.** (1877- ). An American airman, born at Mansfield, Ohio, educated in France and the United States Military Academy in America. He won the first Gordon Bennett Balloon Race at Paris in 1906 and the National Balloon Race in 1911. Also, he organized army air service in the Philippine Islands. He was on active duty in France, 1917-19, being in charge of the Air Service of the Second Army A. E. F. (1918-19). In 1922,

he was air service representative of the War Department.

**LAIRD, JOHN** (1887- ). A British professor of philosophy. He was educated at the universities of Edinburgh and Cambridge. He became professor at Dalhousie University, Nova Scotia, in 1912 and was subsequently called to the chair of logic and metaphysics at Queen's College in the University of Belfast. He was the Mills lecturer for 1923-24 at the University of California. His writings include *Problems of the Self* (1917) and *A Study in Realism* (1920).

**LAKE ERIE COLLEGE.** An institution for women founded at Painesville, Ohio, in 1859. The number of students increased from 116 in 1914 to 186 in 1924, and the number of teachers on the faculty from 23 to 27. The library was recatalogued during the period and much dead timber withdrawn; it increased from 12,300 to 16,000 volumes. The productive funds rose from \$244,623 to \$365,340 and the annual income from \$59,388 to \$171,596. A gymnasium was built at a cost of \$181,863, a large residence hall was bought and converted into a dormitory, and a second was rented for the same purpose. A department of Spanish was created, and the department of psychology and education was separated from the department of philosophy. President, Vivian B. Small, LL.D., Litt. D.

**LAKE FOREST COLLEGE.** An institution at Lake Forest, Ill., founded in 1857. There were 230 students and 21 members of the teaching staff in 1923. The library contained 37,000 volumes. Between 1914 and 1924, there was a gain of \$400,000 in the endowment, and the Swift central heating plant was built at a cost of \$90,000. The curriculum was adapted to modern demands with the development of courses in business administration, leading to the degree of Bachelor of Business Administration. President, Herbert McComb Moore, D.D.

**LAMARCK THEORY, MODERN VIEWS OF.** See HEREDITY.

**LAMB, ARTHUR BECKET** (1880- ). An American chemist, born at Attleboro, Mass. He was graduated from Tufts College in 1900, and studied chemistry at Harvard, Leipzig, and Heidelberg. He was instructor in electrochemistry at Harvard, after which he was assistant professor and professor of chemistry and director of the Havemeyer Laboratory of chemistry at New York University. In 1912, he returned to Harvard where he has held similar appointments. During the War he was the chief of the chemical defense division of the Chemical Warfare Service with the rank of lieutenant-colonel and later was also director of the Nitrogen Research Laboratory. His original studies have been varied and include researches on such topics as the dehydration of periodic acid, isomensin in conmoric acid derivatives, the potential of iron, equilibria among cobaltamines, removal of carbon monoxide from air, and active charcoal, on all of which he has published the results of his investigations. In 1917, he became editor of the *Journal of the American Chemical Society*.

**LAMME, BENJAMIN G.** (1864-1924). An American electrical engineer, born on a farm near Springfield, Ohio, and educated at the Ohio State University. He was one of the four greatest electricians of his time, ranking with Edison, Steinmetz, and Tesla. Beginning with the Westinghouse Company in 1889 at \$30 a

month, he became its chief engineer in 1903. He had been but six months in the employ of the company when he had designed the double-reduction gear-railway electric motor. Later he devised the great "umbrella" generators which made possible the use of the power of Niagara Falls, the high-tension system of power transmission, the alternating-current system, and many other outstanding inventions. He was also a great teacher, and inspired a vast number of investigators throughout the world and in 1923 the Ohio State University, in giving him the Joseph Sullivan Medal, pronounced him "the greatest living mathematician." During the War he represented the American Institute of Electrical Engineers on the Naval Consulting Board and was chairman of the Board's Inventions Committee.

**LAMONT, THOMAS WILLIAM** (1870- ). An American banker, born in Claverack, N. Y. He was graduated from Harvard in 1892, and for a time was engaged in newspaper work. From 1903 to 1909, he was secretary and treasurer and vice president of the Bankers Trust Company. He joined the firm of J. P. Morgan and Company in 1911 and was also a director and official in many important financial corporations. During the Peace Conference in Paris, he was one of the chief financial advisers of the American delegation. He also took a prominent part in the discussions on reparations held in London in July and August, 1924. In 1912, he was elected an overseer of Harvard University.

**LAND BANKS.** See AGRICULTURAL CREDIT.

**LAND GRANT COLLEGES.** See AGRICULTURAL EDUCATION; AGRICULTURAL EXTENSION.

**LAND RECLAMATION.** See RECLAMATION, LAND.

**LANDIS, KENESAW MOUNTAIN** (1866- ). An American jurist (see Vol. XIII). He served as judge of the Northern District of Illinois from 1905 to 1922, resigning in the latter year to accept the position of commissioner for the American and National Leagues of Professional Baseball Clubs, and National Association of Professional Baseball Leagues. In 1921, he acted as arbiter of building-trade disputes fixing the wage of all classes of building trades in Chicago.

**LANDSBERGER, ARTHUR H.** (1876- ). A German writer, born at Berlin and educated at the universities of Berlin, Greifswald, Munich, Heidelberg and Paris. He spent some years in traveling and in 1907 joined Georg Brandes, Hugo von Hofmannsthal, Prof. Werner Sombart, Prof. Richard Muthé and Richard Strauss in the establishment of the magazine *Morgen*, which during its comparatively brief existence was at the head of German periodical literature. He is the author of *Das Kind mit den Vier Müttern* (1911); *Hass* (1916); *Lache, Bajazzo* (1916); *Die Neue Gesellschaft* (1917); *Feldpostbriefe eines Englischen Offiziers* (1917); *Bei Seinen Leuten* (1917); *Teufel Marietta* (1918); *Der Fall Horn* (1918); *Abenteuer* (1918); *Frau Dirne* (1918); *Wie Satan Starb* (1919); *Miss Rockefeller Filmt* (1920); *Was die Nacht mir Zuträgt* (1920).

**LANE, FRANKLIN KNIGHT** (1864-1921). An American cabinet officer (see Vol. XIII). He was appointed Secretary of the Interior by President Wilson, in 1913, and during his tenure took an active part in many important measures, and was considered one of the most

efficient members of the cabinet. He gave especial attention to the conservation of public resources. He retired from office on Mar. 1, 1920, on account of ill health. Shortly after, he became vice president of the Pan-American Petroleum and Transport Company. His letters were published in 1922.

**LANE, RALPH NORMAN ANGELL** (1874- ). An English author and lecturer (see Vol. XIII). Among his later writings are: *The Dangers of Half-Preparedness* (1916); *Why Freedom Matters* (1916); *War Aims* (1917); *The Political Conditions of Allied Success* (1918); *The British Revolution and the American Democracy* (1919); *The Economic Chaos and the Peace Treaty* (1919); *The Fruits of Victory* (1921).

**LANG, COSMO GORDON** (1864- ). Archbishop of York. He was educated at Glasgow University and Balliol College, Oxford. After studying at the Inner Temple in London, from 1883 to 1889, he entered the church and was curator of Leeds from 1890 to 1893. He served as vicar of St. Mary's, Oxford, from 1894 to 1896, and was created Bishop of Stepney in 1900. From 1901 to 1908, he was canon of St. Paul's Cathedral, and in the latter year was appointed Archbishop of York. He visited the United States in 1918. His published writings include *The Miracles of Jesus, as Marks of the Way of Life* (1900); *Parables of Jesus* (1906); *The Opportunities of the Church of England* (1906). He received degrees from many universities.

**LANGDON, STEPHEN HERBERT** (1876- ). An American Assyriologist. He was born in Michigan and studied at the State university, at Union Theological Seminary in New York, at Columbia University, the Sorbonne and Collège de France in Paris, Leipzig and Oxford. He was deacon of the Church of England in Paris, 1905, and, after 1908 was Shillito professor of Assyriology at Oxford. He is the author of *Annals of Assurbanapal* (1905); *Les Inscriptions du Wadi Brisa* (1905); *Babylonia and Palestine* (1906); *La Syntaxe du Verbe Summérien* (1907); *Sumerian and Babylonian Psalms* (1909); *A Sumerian Grammar and Chrestomathy* (1911); *Neu-Babylonische Königsinschriften* (1912); *Babylonian Liturgies* (1912); *Tammuz and Ishtar* (1914); *Sumerian Epical and Liturgical Texts* (1915-17); *Le Poème Summérien du Paradis* (1919); *Sumerian Liturgies and Psalms* (1919); and was editor of *Babyloniaca* (Paris, 1908-14).

**LANGFELD, HERBERT SIDNEY** (1874- ). An American experimental psychologist. He was born on July 24, 1874, at Philadelphia, Pa., and was educated at Haverford College and the University of Berlin. In 1902-03 he served as Second Naval Attaché at the American Embassy in Berlin. He returned to academic work, and in 1910 became associated with the department of psychology at Harvard University. In 1919, he was appointed director of the experimental laboratory. His publications include, in addition to experimental monographs, a manual on *Experimental Psychology* (1916) and an empirical study of aesthetics *The Aesthetic Attitude* (1920).

**LANGLEY AÉRODROME.** See AÉRONAUTICS.

**LANGLOIS, CHARLES VICTOR** (1863- ). A French historian, born at Rouen, and educated at the Lycée St. Louis in Paris. He was

admitted to the Ecole des Chartes, where he was graduated with honors. In 1912, he was appointed professor at the Faculty of Letters of the University of Paris and director of the national archives. He was admitted to the Institute of France in 1917 as a member of the Academy of Inscriptions and Belles Lettres. He was also member of the Commission for the Literary History of France. He was the author of: *Le Règne de Philippe III* (1887); *Les Archives de l'Histoire de France* (1891-93); *Manuel de Bibliographie Historique* (2 vols., 1896-1904); *L'Inquisition* (1902); *Histoire du Moyen Age* (1901); *Questions d'Histoire et d'Enseignement* (1902); *Histoire de l'Écriture en France* (1904); *Introduction aux Etudes Historiques* (1905); in collaboration with Professor Seignobos). The last-named work was translated into English.

**LANGMUIR, IRVING** (1881- ). An American chemist, born at Brooklyn, N. Y. He was graduated at Columbia University and later studied in Göttingen, where he received his Ph.D. in 1906. He was instructor in chemistry at Stevens Institute of Technology but in 1912 became research chemist to the General Electric Company in Schenectady, N. Y., where he devoted much attention to the development of gas-filled tungsten lamps, besides electron discharge apparatus, and devised a high vacuum pump. These have gained for him the Nichols medal of the New York Section of the American Chemical Society in 1915 and in 1920, the Hughes medal of the Royal Society of London in 1918, and the Rumford medals of the American Academy of Arts and Sciences in 1920. During the War he made special experiments on devices for the detection of submarines at the Naval Experiment Station at Nahant, Mass. See **CHEMISTRY**.

**LANSDOWNE, HENRY CHARLES KEITH**, fifth MARQUIS OF (1845- ). An English public official. He served as minister without portfolio in the Coalition Cabinet in 1915-16. At the end of the War he took a moderate attitude in regard to peace, and published several proposed plans, parts of which were incorporated in the Treaty of Versailles.

**LANSING, ROBERT** (1864- ). An American lawyer and public official (see Vol. XIII). Shortly after assuming the office of counselor for the State Department, he succeeded William Jennings Bryan as Secretary of State, holding that office until 1920, when he was dismissed by President Wilson for alleged usurpation of the latter's authority by calling cabinet meetings during the latter's illness. He was a member of the American Commission to Negotiate Peace at Paris in 1919 and published *The Big Four and Others at the Peace Conference* (1921) and *The Peace Negotiations* (1922). Following his retirement from the cabinet, he practiced law in New York City.

**LANSING-ISHII AGREEMENT**. See **JAPAN, History**.

**LAOÑ**. See **WAR IN EUROPE, Western Front**.

**LAOS**. See **FRENCH INDO-CHINA**.

**LAPARRA, RAOUL** (1876- ). A French composer, born at Bordeaux. He studied at the Paris Conservatoire under Fauré and Massenet, and won the Prix de Rome in 1903 with a cantata, *Ulysse*. He gained international reputation with his opera *La Habañera* (Paris, 1908; Boston, 1910; Metropolitan Opera Company,

1924). Also operas are *Peau d'âne* (Bordeaux, 1899), *La Jota* (Paris, 1911), and two not yet produced (1924), *Amphitryon* and *L'Aventure pittoresque*. He also wrote incidental music to *El Conquistador*, a violin sonata, and interesting pieces for piano.

**LARDNER, RING W.** (1886- ). An American writer, born at Niles, Mich. He served as a sports writer for many different newspapers, including the *Chicago Tribune* and *Boston American*. His books include: *Bib Ballads* (1915); *You Know Me, Al* (1915); *Gullible's Travels* (1917); *Own Your Own Home* (1917); *Treat 'Em Rough* (1918); *The Real Dope* (1918); *The Young Immigrants* (1919); *The Big Town* (1921), and *How to Write Short Stories* (1924). As a fictionist he was first known for his humorous and slangy genre sketches of the sporting world, his baseball players and Broadway hangers-on being depicted with fidelity and kindness. His *How to Write Short Stories* seemed to be approached in the same light spirit, but the stories which composed the volume indicated a matured artistic attitude and a seriousness of purpose, in the handling of his typical American lower middle-class characters, that at once prompted critics to group the work with Masters's *Spoon River Anthology* and Anderson's *Winesburg, Ohio*.

**LASKI, HAROLD J.** (1893- ). An English political philosopher, born at Manchester, and educated at New College, Oxford. During 1916-20 he was a lecturer at Harvard University and gained wide attention in the United States for the freshness of his point of view and his remarkable erudition. In 1920 he returned to England to join the London School of Economics, and in 1923 he became political science reader at the University of London. His works on the problem of sovereignty in the modern state, with their insistence on political and economic decentralization—*The Problem of Sovereignty* (1917), *Authority in the Modern State* (1919), and *Foundations of Sovereignty* (1921)—were hailed as the most important contributions to the political thought of the period. He showed his familiarity with the history of political thinking in his masterly summary, *Political Thought from Locke to Bentham* (1920). He edited a volume of Burke's *Letters* (1920) and Morley's *Essay on Burke* (1924).

**LASKY, JESSE L.** (1880- ). An American moving picture producer, born at San Francisco, Cal. He was educated in the schools of San Francisco and was for a time reporter on newspapers in that city. After experiences in Alaska and Hawaii, he entered the theatrical business with Henry B. Harris in New York City. In 1914, he organized and became president of the Jesse L. Lasky Feature Play Company, which was afterwards merged with the Famous Players-Lasky Corporation, and with large studios at Hollywood, Cal. He was one of the most important figures in the development of moving pictures.

**LASSITER, WILLIAM** (1867- ). An American soldier, born in Petersburg, Va. He graduated from the United States Military Academy in 1889, and was commissioned in the artillery, in which he served during his military career. He saw service in the Spanish-American War and was on duty with the General Staff in 1911 and 1913. He was commis-

sioned brigadier-general in the National Army in 1917, and major-general in the following year. He was chief of artillery for the 1st Corps in 1918 and served in the same capacity with the 2d Army later in the same year. He was commander of the 32d Division in 1918-19, and was chief of artillery of the 3d Army in April, 1919. In August of that year he returned to the United States. From 1921 on he was chief of staff in charge of operations and training.

**LATANÉ, JOHN HOLLIDAY** (1869- ). An American educator, born at Staunton, Va. He graduated from Johns Hopkins University in 1892 and after serving as acting professor of history and economics in the Baltimore City College, he became master of history and English at the Military College at San Rafael, Cal. From 1898 to 1902, he was professor of history and economics at Randolph-Macon Woman's College, and from 1902 to 1913, professor of history at Washington and Lee University. In 1913, he became professor of American history and head of the Department of History at Johns Hopkins, and in 1919, dean of the college faculty. He was a member of many learned societies and wrote *From Isolation to Leadership* (1918) and *The United States and Latin America* (1920).

**LATOURETTE, KENNETH SCOTT** (1884- ). An American educator, born at Oregon City, Ore. He was graduated at Yale in 1906 and was a member of the faculty of that university until 1909. For a time he served as traveling secretary of the Student Volunteer Movement of Foreign Missions, and from 1910 to 1917 was a member of the faculty of the college of Yale in China. In 1914, he became a member of the faculty at Reed College, Portland, Ore., afterward going to Denison University. In 1921, he became professor of missions at Yale. He was ordained to the Baptist ministry in 1918. Among his works are: *History of Early Relations Between the United States and China, 1784-1844* (1917); *Development of Japan* (1918); *The Christian Basis of World Democracy* (1919).

**LATTER-DAY SAINTS.** See REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.

**LATVIA.** One of the Baltic Succession States arising out of the War, formerly part of the Russian Empire. It is made up of the former Russian province of Courland, the southern half of the former province of Livonia, and the western part, amounting to about one-third, of the former province of Vitebsk. It covers 25,402 square miles of territory, with a coast line of 338 miles and a total frontier line of 1040 miles, bounded by Esthonia on the north, Russia on the east and Lithuania on the south. Total population, 2,552,000 in 1914; 1,885,870 in 1923. Capital, Riga. For adminis-

trative purposes it is divided into four districts. The census of Jan. 1, 1923, divided the population into the following ethnic groups: 72.6 per cent Letts, 5.7 Russians, 5.0 Jews, 4.2 White Russians, 3.6 Germans, and 3.3 Poles. Of the total population, 76 per cent was rural. Density per square mile was 74.5. By occupations: 56 per cent agricultural, 18 per cent in industry, and 6 per cent in trade. About 60 per cent of the population was Protestant. Catholic majorities were to be found in Latgale and parts of Courland. Population of chief towns, 1923: Riga, 280,000 (517,552 in 1913); Libau, 71,700; Dunaburg, 39,000; Mitau, 24,000; Windau, 10,000.

**Production.** Total rural area, 16,435,000 acres. Of this, arable land, about 4,500,000; meadows, 2,200,000; pasture land, 2,400,000; forests, 4,791,000; waste land, 2,544,000. By the agrarian law of Sept. 16, 1920, the largest estates were nationalized for partition among the great landless peasantry. By 1922, the distribution was as follows: larger estates or farms, numbering about 200,000, occupying 7,449,140 acres; peasant holdings, about 50,000, with 6,093,620 acres; state lands, 1,550,500 acres; church lands, 167,330 acres. The country was only slowly recovering from the effects of the War, as shown by the crop statistics. In 1923, there were 338,000 horses (320,000 in 1913); 900,000 cattle (912,000 in 1913); 484,000 swine (557,000 in 1913); 1,461,000 sheep (996,000 in 1913).

Industries showed steady expansion. In 1921, there were 1709 industrial enterprises, employing 28,643 people; in 1922, 1906 with 74,000 h.p. and 31,827 employees; in 1923, 2130 with 83,807 h.p. and 33,961 employees. In 1914, in Riga alone, 65,000 workers were employed. Lumber yards employed 6973 hands in 1923; metal working establishments, 6545; foodstuffs manufacturing enterprises, 5558; textile mills, 4267; paper mills, 3938. There were about 100 incorporated concerns, with approximately 50,000,000 lats stock capital.

**Trade.** The volume of trade was growing year by year, as shown by the following comparison:

| Year      | Imports<br>(In lats; 1 lat=\$0.193) | Exports     |
|-----------|-------------------------------------|-------------|
| 1921..... | 70,697,355                          | 29,264,991  |
| 1922..... | 107,370,110                         | 101,992,006 |
| 1923..... | 211,872,025                         | 161,929,052 |

The chief articles of import in 1923 were: Manufactured, semimanufactured goods, i.e. wool and woolen yarn, iron and steel products, hides and leather, petroleum; manufactured goods, i.e. cotton and woolen goods, machinery, implements; foodstuffs, i.e. grain and flour, sugar, herring, tobacco. Chief among commodi-

\* Metric Tons.

ties exported were: lumber, 42,165,000 lats; other wood materials, 13,650,000 lats; flax and flax tow, 41,559,000; precious metals, 10,154,000; butter, 9,272,000. By countries of origin, 1923 imports were distributed as follows: Germany, 95,850,000 lats; United Kingdom, 36,087,000; Lithuania, 11,345,000; Netherlands, 10,381,000; Poland, 8,319,000; Russia, 7,553,000. Main countries of destination of exports: United Kingdom, 74,967,000; Belgium, 31,961,000; Germany, 12,281,000; France, 10,719,000; Russia, 5,963,000.

**Transportation.** Length of railroads, 1839 miles (1923). Number of locomotives 320, freight cars 5324, passenger cars 467. At the beginning of 1924, Latvia's shipping included 31 steamships of 38,310 registered tons, 56 sailing vessels of 9129 tons, and 9 motor ships of 993 tons, making a total of 96 ships, aggregating 48,432 tons. This represented a long stride toward restoration of the country's prewar merchant fleet, which on Jan. 1, 1914, comprised 59 steamers of 77,626 registered tons, and 274 sailing and motor vessels of 49,093 tons, but which by the end of 1921 had decreased 75 per cent, or to 34,021 tons. Vessels entering Latvian ports in 1923: 3577, of 1,442,130 net tons capacity; cleared, 3571, of 1,431,500 tons.

**Finance.** For the year 1921-22 the budget balanced at 9,855,893,800 Latvian rubles (about \$32,852,800); for the year 1923-24, it balanced at 174,383,390 lats (roughly \$33,664,747, at the exchange rate of 1 lat to \$0.193). On Oct. 1, 1922, it was stated that the national debt was as follows: to United States, \$2,521,870; to American Relief Administration, \$2,610,418; to Norway, 6,737,558 crowns; to Great Britain, £20,169; to France, 1,741,516 francs; to private banks, £178,400. In the middle of 1923 the total foreign debt amounted \$6,620,460. The internal debt amounted to \$96,500. There were in circulation, Dec. 31, 1923, 23,000,000 lats. On Nov. 1, 1922, the Bank of Latvia, in which the government was the chief stockholder, was opened. In June, 1922, the lat (\$0.193) became the unit of currency, and during 1922 and 1923 the government maintained it at par.

**Education.** At the beginning of 1922, there were 1725 elementary schools with 165,598 pupils and 5530 teachers. There were 107 secondary schools with 15,080 pupils. By the census of 1920, it was established that 70 per cent of the population could read. National minorities were taught their native languages in government schools, which numbered 410 of the total 1725 elementary schools. In 1919, the Riga Polytechnic was raised to be the Latvian University. In 1922, there were 5421 students and 161 instructors.

**History.** Early in 1918, as a result of the uncertainty engendered by the Russian Revolution and the threatening gestures of the peasants, German forces were invited by the Baltic barons to occupy Latvia. The Bolshevik troops were compelled to retire, and German troops invested the country. A German army of occupation was allowed to remain even after the Armistice, for the Allies were not yet prepared to guard the country against Russia. (See BALTIC PROVINCES.) Immediately after the Armistice, on Nov. 18, 1918, independence was declared and a government formed by the moderate, or peasant, element. Bolshevik troops at once invaded the new state, captured Riga early in January, 1919, expelled the Latvian

government, and set up a Soviet government. War was waged intermittently throughout the year, the chief Latvian force being a Baltic *Landwehr*, officered by Germans. In May, the Bolsheviks were driven from Riga, but the fear of German preponderance made the native Letts seek aid from the Allies. The Ulmanis government (the peasant parties) was recognized and an Englishman was placed in charge of the *Landwehr*, which thus became the official Lettish force. Latvia now (1919) became a battleground as a result of the Allied determination to attack Russia by way of the Baltic provinces. A "White" Russian-German force overran the country, ostensibly to engage Bolshevik troops along the Narva and the Duna lines. There was fighting late in 1919 in which Letts, German mercenaries, "White" and "Red" Russians were engaged. Riga was besieged for four weeks in October-November, 1919; the Letts were compelled to take up arms against the German army under General Bermond; Mitau was evacuated by the "White" Russian-German forces; and finally in January, 1920, after months of pillaging, the German troops consented to evacuate Courland. Another blow was struck for Latvian independence when the Lettish national *Landwehr* defeated the Bolsheviks in Latgallia. Thus, by 1920, the native Letts for the first time were in sole occupation of their territory. Negotiations with Russia soon commenced and on Aug. 11, 1920, a Russo-Latvian treaty was signed at Riga. Its main provisions were: an ethnographic frontier for Latvia; a large timber concession to Latvia; nonliability for Russian state debts; disarming of anti-Bolshevik troops in Latvia; free transit for Russian goods across Latvian territory; payment to Latvia of 4,000,000 gold rubles.

A Constituent Assembly, called in 1920, completed a national constitution on Feb. 15, 1922. A parliament (*Saeima*) elected by universal suffrage and based on proportional representation, which chooses the state president, was provided for. The prime minister, in turn, was to be designated by the state president. The first Parliament, elected on Oct. 7, 1922, was controlled by a Social Democrat bloc, with the peasant and minority parties in the opposition. Of the last there were no less than 17 distinct groups having a total of 41 members. A new government formed June 10, 1923, was supported by a coalition of the Peasants' League, Democrats of the Centre, and Right Socialists, with the premiership held by the head of the Peasants' League. After recognition of Latvia by the Supreme Council, the country was admitted to the League of Nations on Sept. 22, 1921.

Russian influence in Latvia became marked again late in 1922, when a Baltic Alliance was formed between Russia and her Succession States. This understanding provided among other things for an economic alliance, disarmament, and agreement on customs, consular, and trade matters in order to facilitate the Russian transit trade via the Baltic ports (see ESTHONIA). There was thus, as a result of a peaceful foreign and domestic policy, every indication in 1924 that the country was proceeding along the right road to economic well-being. The government's attitude toward the new farmers was paternalistic; a stabilized currency encouraged industrial growth; social conditions, e.g. housing, wages, sanitation, were favorable; and by commercial treaties negotiat-

ed with Czecho-Slovakia, Hungary, England, and France, the movement toward the consolidation of the trade frontiers was gaining headway.

**LAUSANNE CONFERENCE AND TREATY.** See **PEACE CONFERENCE AND TREATIES**; **TURKEY**, etc.

**LA VERNE NOYES FOUNDATION.** See **EDUCATION IN THE UNITED STATES**.

**LAW, ANDREW BONAR** (1858-1923). A British statesman see (**VOL. XIII**). On the formation of the first Coalition Cabinet in 1915, he was appointed Secretary of State, and in the first Lloyd George ministry in 1917, he became Chancellor of the Exchequer, and in this capacity introduced the budget in May, 1919. Owing to the constant absence of the Prime Minister in 1916-19, he acted as leader of the House during that period. He was also a member of the War Cabinet. In 1919, he was the plenipotentiary to the Peace Conference. After the general election of December, 1918, he became Lord Privy Seal and leader of the House. He headed the Conservative revolt from the Coalition Cabinet in 1922, and contributed largely to the victory of the Conservative party, in October of that year, and was chosen Prime Minister and head of the Conservative government. He resigned on account of ill health and died on Oct. 30, 1923.

**LAW, INTERNATIONAL.** See **BLOCKADE**.

**LAW, PROGRESS OF THE.** Law may be said to be the totality of rules prescribed by the proper authority for the regulation of society. One of the inherent qualities of law is its stability. The permanency of the content of law is generally attributable to two factors: (1) the recognition that there are basic principles in the legal order which are final and immutable, and (2) the practical expediency which necessitates an adherence to settled rules. As Blackstone expressed the first element: "These are the eternal, immutable laws of good and evil to which the Creator Himself in all His dispensations conforms; and which He has enabled human reason to discover, so far as they are necessary for the conduct of human affairs." Out of this acceptance of a natural law is derived the doctrine of natural rights which has played an important part in shaping the course of American constitutional law. There is also a practical reason for the rigidity of positive law. The common law is a barrier against arbitrary decisions of the judiciary. Safety demands certainty in the administration of law. But the doctrine of *stare decisis* and the force of precedent are not alone based upon the assumption that individualization is unwise; society postulates a body of legal rights and duties which are predictable, vested interests which are determinable and fixed.

It does not follow, however, that the law is a static and unchangeable picture. Law must possess a considerable degree of rigidity, but it also possesses elasticity and adaptability in order to meet current social and economic changes. Courts and legislatures are constantly at work altering, amending and adding to legal rules. The growth of industry, the increase of poverty, the shortage of homes and similar emergencies of the time and place must be faced and solved as they arise. The automobile, the radio and the aeroplane, to mention only a few modern inventions, bring about novel complications which are rapidly translated into legal problems. The pronounced centralization in urban

communities increases friction and conflict of societal relations which are frequently absent in rural life. It is the task of the jurist and the legislator to view these penetrating influences of the day and to readjust the juristic machine to meet the current changes in the social order.

We therefore find that the law is made up of the contrasted forces of permanency and change. One of the most troublesome questions of juristic science is to apportion the contesting principles of certainty and flexibility in the growth of law. How far should the courts be permitted to go in the readjustment of law to fit the particular case? Is it preferable to have a settled rule or discretionary power in the administration of justice? At the present time, the movement of law seems to be in the direction of an enlargement of discretion, an extension of the so-called individualization of law. Courts are manifesting a keener interest in the practical effect of social and economic changes upon the established principles, and a willingness to upset these legal formulas in certain cases. The expansion of discretion is evident in the creation of administrative boards and commissions which have taken over functions formerly exercised by the judiciary. These extra-judicial groups are given considerable latitude in the decision of particular cases. But the common-law emphasis upon stability as a barrier against the whims of capricious judicial and administrative action is still a substantial ingredient in the progress of American law. Natural law with its assumption of basic norms to test the validity of given laws, while rejected by pragmatic philosophers of law, may be noted in the current language of the courts.

The scope of this article embraces a general survey of recent developments in the major branches of law. It attempts to outline the current tendencies of juristic science; its partial acceptance of the need of readjustment of legal principles to meet changing conditions in society; its stern insistence upon the retention of the doctrine of *stare decisis* as a check against arbitrary decisions; and the proposals of reform which are intended to perfect the law as an instrument to accomplish justice.

**Constitutional Law.** The panorama of constitutional law portrays the course and progress of law in general. Basic principles of the Constitution are so closely interwoven into the fabric of American law that contemporaneous evolution, particularly in statutory law, usually raises questions of constitutional usurpation. Novel experiments of legislation introducing changes in the customary law inevitably must be weighed and tested by the clauses of our organic law before their validity is finally determined.

Of late there is growing up among the justices of the United States Supreme Court a difference of opinion regarding the scope of judicial review in gauging the constitutionality of State and Federal legislative acts. On the one hand, there is the assumption that the Supreme Court is empowered to investigate the "reasonableness" of the given statute and to analyze the necessity, utility and efficacy of the proposal. On the other hand, this broad power of review is contested by a minority of the Supreme Court on the ground that such latitude virtually makes the Supreme Court a super-legislature; and that the Supreme Court can-

not impose its own views of the wisdom of legislation in cases where the law does not offend any clause of the Constitution. A concrete and striking illustration of this division of judicial opinion may be noted in the important Minimum Wage Case, decided in 1923. The primary question was the constitutionality of the Act of Congress establishing a Minimum Wage Commission in the District of Columbia for the purpose of fixing a minimum wage for women and children. The majority of justices declared that the statute was unconstitutional because it violated the guarantees of due process of law. Their prevailing opinion analyzes the social, ethical and economic validity of the minimum wage, rejects the opinions of social workers as "only mildly persuasive" and draws the subtle distinction between the limitation of the hours of labor and establishment of a living wage. This range of judicial inquiry is strongly resisted in the minority opinions in the Minimum Wage Case. It is argued therein that it is not within the province of the Supreme Court to hold Congressional acts invalid simply because they contain economic formulas which members of the Supreme Court believe to be unwise or unsound.

Whatever may be the ultimate outcome of this present divergence of judgment in the matter of constitutional interpretation, it may be safely stated that the flexible clauses of the Constitution necessitate a considerable degree of individual infiltration in the solution of new problems of social and economic reform. The political, ethical and economic theories of the judges cannot be entirely eradicated in the application of the generalizations of the Constitution. Changes in the personnel of the Supreme Court, following resignation or death, sometimes result in the retardation of social legislation. Thus it has been asserted that the Minimum Wage decision was an accident of time; that an earlier hearing would probably have sustained the constitutionality of this law. This does not imply that the opinions of the Supreme Court involve the stubborn and willful assertion of individual prejudices. But it does mean that the latitude of the clauses of the Constitution inevitably permits a rather generous display of personal judgment regarding the meaning of the given section of the organic law.

**Due Process of Law.** One of the most frequent sources of constitutional litigation is the "due process of law" clauses of the Fifth and Fourteenth Amendments. The State and Federal governments are herein prohibited from depriving any person of "life, liberty or property" without the orderly and settled usages of law. The all-embracing language defies exact and indelible definition, but its inherent importance makes it the basis for frequent attacks upon current legislation. The decisions interpreting the due process clause may be divided into two classes: (1) those pertaining to life and liberty, and (2) those particularly applicable to property rights. This classification, while convenient, is not strictly accurate, since many decisions involve at once an alleged invasion of personal and property rights.

**Life and Liberty.** The right to be free from unlawful physical restraint is of the essence of life and liberty. This right is scrupulously upheld unless the exercise of it interferes with the public welfare. A limitation of the right of freedom of the person is found in the case of

compulsory vaccination, which has been held to be constitutional and not violative of the liberty of the individual. But liberty means not only the right to be free from physical duress but also to use freely one's faculties in lawful ways, to live and to work, to make contracts without undue interference from the State. It is said that liberty of contract is the rule and its curtailment is the exception. But the general rule has suffered many invasions which have been declared to be constitutional. Many recent laws have been passed restricting the freedom of contract in the interest of the public. The whole compass of workmen's compensation legislation, laws regulating the hours of labor, statutes restricting the power of the husband to mortgage household goods or assign wages, regulation of the insurance by the State, are current types of laws which invade the former generalization, liberty of contract.

Some of the modern literature of law maintains the view that liberty of contract is a fiction of judicial minds which has been read into the Fourteenth Amendment, a result of the "innocuous generality" of liberty to follow the ordinary callings of trade. It has also been claimed that this concept of liberty is due to the acceptance of Sir Henry Maine's doctrine that the evolution of law discloses a progress from status to contract. While it is true that the expression, "liberty of contract," is not found in the Fourteenth Amendment and that the common law has made inroads into the Sir Henry Maine formula, it is equally certain that there are individualistic tendencies in the common law, and more particularly in American law and traditions, that compel the courts to move slowly in overthrowing this freedom of individual action in commercial pursuits. We may follow this hesitancy of the courts in the judicial nullification of legislation which invades the right of contract. In 1910, the New York Court of Appeals declared the workmen's compensation law to be unconstitutional and a minority of the Supreme Court of the United States held a similar view as late as 1920. The correct principle, at least the present legal formula, seems to be that liberty of contract is embraced within the definition of liberty in the Fifth and Fourteenth Amendments. But there exists the potential and limited right to curtail this liberty of contract when the invasion is justified by the public interest and the social welfare.

This endeavor to balance the right of free contract and the police power of the State is visible in recent pronouncements of the Supreme Court. The State may prescribe conditions of employment on public works because this is work of a public character, but the State cannot determine wages between employer and employees in private employment, even when the legislature declares that a business is affected with a public interest. This distinction was sharply drawn by the Supreme Court in its analysis of the Kansas Industrial Court insofar as the Kansas Industrial Court attempted to regulate wages in industrial enterprises. The State may regulate insurance rates, since this business directly touches the public welfare, but the State cannot establish a minimum wage for women because, in the words of Mr. Justice Sutherland, it is "not a law dealing with any business charged with a public interest."

**Property Rights.** The conservation of the right of property is clearly within the purview

of the due process clause of the Constitution. This right, however, is not absolute, but may be partially or even completely extinguished when the public interest requires it. The most striking example of the relativity of property rights, excluding the right of eminent domain, may be noted in the operation of the Eighteenth Amendment prohibiting the manufacture and sale of intoxicating liquors. This Amendment automatically prevented the use of property and instrumentalities for the forbidden purposes and thereby materially lessened the value of these properties without compensation. Similar laws and statutes restricting or prohibiting the sale of food products have been held to be constitutional since they were passed to safeguard the public health. A familiar restriction is the "blue-sky" law which conditions the sale of securities without a State license. Laws regulating the height of buildings, "zoning" laws and ordinances prohibiting or taxing the use of land for billboards, all of which have been declared to be constitutional, are modern illustrations of the lawful invasion of the individual's property rights.

*Equal Protection of the Laws.* The Fourteenth Amendment, in addition to its provision establishing and guaranteeing due process of law, provides that all persons within the jurisdiction of the State shall be accorded "equal protection of the laws." This important phrase secures equal treatment to all persons in the enjoyment of their rights and privileges. Equal protection does not prevent the State from classifying portions of the people according to their particular relations, but this classification must be based upon some real difference which separates the class affected from the other groups in the social order. This constitutional guarantee was originally incorporated to secure to the colored race, then recently emancipated, the complete enjoyment of their freedom, but the Amendment is not confined to racial inequalities. Within its original purpose may be noted the cases that consider the constitutionality of legislation which establishes separate schools for white and colored children, separate coaches and stations in railroad service. These statutes have been validated on the ground that equality of laws does not necessitate intermixture of the races socially, provided that both races are given similar accommodations. But when a State passed a law prohibiting a colored person from buying property in a white district, and imposed the same restriction upon a white person purchasing property in a colored section, the Supreme Court held that this provision, although aimed to lessen racial strife, exceeded the power of the State and violated the guarantee of equal protection of the laws.

Laws that classify distinct groups in the community are valid provided that the distinction is not arbitrary or unreasonable. For instance, the State may pass special regulatory statutes controlling insurance companies, banks, grain elevators and mines. Such legislation may impose various forms of licenses, different rates of taxation and varied modes of control without offending the equal-protection clause. The employer-employee relation has been especially subject to particular legislation. Laws control hours of labor, working conditions and safety appliances. But arbitrary discrimination will be inhibited in industrial legislation. In a recent case the Supreme Court held a statute of

Arizona to be unconstitutional which prohibited the use of injunctions in labor disputes, although a vigorous dissent to this decision was registered by four justices.

*Police Power of Government.* The police power inherent in government balances and limits the liberty of the citizen for the common good. The boundary of the police power is shadowy and uncertain. It sometimes includes a consideration of the limits of legislative power, sometimes a discussion of the conflict of State and Federal authority, and frequently the vague definition of the public welfare and individual right. Police power lies at the base of all those laws which curtail the freedom of contract, regulate the conduct of business, impose restrictions upon the use of property and protect the health and safeguard the morals of the citizenry.

This necessary power of government is broad and flexible. It was recently invoked to curb the property rights of landlords during the housing shortage by the passage of emergency rent legislation. Congress was exercising the police power when it passed the temporary wage scale for railroad employees in connection with the Adamson Eight-Hour Law. The States also are possessed of a similar power which the Federal government must respect within its proper limits. The dividing line between the State and Federal police power is sometimes rather uncertain. The Congress may not, under the guise of taxation or regulation of interstate commerce, usurp the police power of the State. An important application of this principle of the separateness of the police power may be seen in the Child Labor Cases. In these cases, Congress attempted to bar from interstate commerce in the first case, and to tax in the second case, the products of child labor in the States. Obviously the primary purpose was not to regulate commerce or to tax, but simply to reach out and to control intrastate affairs. Both statutes were declared to be unconstitutional as an invasion of State sovereignty.

The strong stand of the Federal judiciary against the covert entry and domination of State business by Congressional acts is wise and necessary. The palpable need of child labor laws is generally conceded. But the duality of our scheme of government negatives the right of Congress to infringe upon the reserved police power of the States to accomplish a worthy end. If this pronounced trend toward centralization were to continue, local government would become a mere name. The Federal government could through the extension of the power to regulate commerce virtually dominate the remote activities of the State. These excursions into States' rights have reached the peak, and the attitude of the Supreme Court gives support to the belief that further encroachments will not be successful.

But the police power of the State is not without limits even in its local environment. The exercise of the police power must bear a tangible relation to the governmental power and a due recognition of individual rights. Thus a State may lay a tax upon or forbid the manufacture and sale of obnoxious and harmful foods such as oleomargarine, or the use of benzoate of soda in nonfermented beverages. A wide latitude even to the point of caprice has seemingly been allowed in State legislation. But the line against excessive and arbitrary pro-

hibition is still drawn, although the separation is often difficult to define. The German language cases, decided in 1923, illustrate the possible misuse of police power by the State. Several States passed laws forbidding the instruction in any foreign language of any children under a certain age or school grade. Without questioning the power of the State to compel attendance and to make reasonable regulations for all schools, the Supreme Court held that the restriction was beyond the power of the State and violative of individual rights. A more extreme form of the same radical exercise of State control is the Oregon Compulsory Public School Law, which prohibits the instruction of children between the ages of 8 and 16 in private schools and compels attendance in public schools. Reinforced by the attitude of the Supreme Court, in the German language cases, the United States District Court for the District of Oregon declared that the Oregon Compulsory School Law infringed upon the liberties of the parents, invaded the property rights of the private institutions affected and usurped the natural and inherent rights of parochial and private schools to teach. These laws indicate in the field of State legislation a present tendency to strain the powers of sovereignty to the breaking-point, and to transgress unduly the reserved rights of the people in accordance with the Bill of Rights, most of which are found in the first 10 amendments to the Federal Constitution.

*The Eighteenth Amendment.* The advent of Prohibition as a national policy has presented many important and original legal questions. The Supreme Court upheld the validity of the Eighteenth Amendment and the constitutionality of the National Prohibition Act which was passed to enforce the Amendment. The enforcement of the law at once raised the question of the territory subject to the provisions of the Act. Did it extend to foreign or domestic ships in territorial waters of the United States? It was decided by the Supreme Court that the Amendment prohibited "transportation" and "importation" of intoxicating liquor into the United States "and all territory subject to the jurisdiction thereof." This territorial control, it was held, included a marginal belt of three geographic miles from the coast line, and extended to all ships, whether foreign or domestic, entering this zone; but it was also held that the National Prohibition Act did not extend to domestic vessels when outside the territorial waters of the United States.

The Eighteenth Amendment provides that Congress and the several States shall have concurrent power to enforce this Amendment by appropriate legislation. Pursuant to this concurrent jurisdiction many States passed local enforcement laws. This dual administration of prohibition raised the question whether an individual could be punished twice for the same violation, once by the Federal and again by State authorities. The question was answered by the Supreme Court to the effect that the Eighteenth Amendment was a limitation and not a grant of power to the States, and that the same act may be an offense against both the State and Federal governments without offending the "double jeopardy" provision of the Fifth Amendment.

Contracts. Social, economic and commercial changes cause corresponding changes in

the branches of the law immediately affected. In an era of expanding commerce and industrial growth based upon credit and confidence, it is inevitable that contracts should enter into a majority of mercantile transactions. The preliminary agreement, the sale of goods, the conveyance of land, the issuance of instruments of credit, the guarantee of payments, the formation of partnerships and corporations, all these business relations necessitate the passing of promises which form the central field of contract law. Due to the fluctuating problems of commerce, the law of contracts discloses renewed signs of activity. The fundamental questions of offer and acceptance, consideration and the like are being reopened and debated in the light of modern business requirements. One of the litigated enigmas of contracts is the definition of the real elements of a promise which will render the promisor legally liable to the promisee. Is it necessary for the promisee to give or to promise to give an equivalent value to the promisor? Or is it sufficient that the parties make a business bargain independent of the relative value of the respective promises or acts? Or does it suffice that a promise is made which is relied on by the promisee without the promisor's assumption of any affirmative obligation?

These queries outline the conflicting theories of the nature of consideration. Dean Roscoe Pound has styled them respectively as (1) the equivalent theory, (2) the bargain theory, and (3) the injurious-reliance theory. The leading theory to-day is the bargain theory, which validates all promises which arise out of a give-and-take bargain. Under this view, it is not fatal that the more exacting requirements of the equivalent theory are missing. But there is a perceptible effort being made by the courts to enlarge the scope of contractual liability according to the mandates of the so-called injurious-reliance theory. This latter theory may seem to be too idealistic in that it seeks to impose a liability for a promise which is not balanced by a corresponding promise from the other party to the agreement. But it is predicated upon the sound ethical doctrine that it is not right for a man to violate his promises even when they are gratuitous. Certainly it is unfair to do so when the promisee acts upon the assumption that the promise will be fulfilled and suffers damage by reason of his reliance. Despite the undercurrent of support for the reliance theory, the prevalent definition of consideration includes the element of mutual undertakings by both parties.

Standardization of the law of contracts has made appreciable progress in certain branches. Insurance contracts have been made uniform by legislation. Negotiable instruments, sales, bills of lading, warehouse receipts, stock certificates and partnerships have been subjects which are governed by uniform acts in many States. Ambitious attempts have been made in a few States to reduce the whole field of contract law to a code; but the attempts have been premature and generally unsuccessful. Codification must involve a restatement of the law; and the difficulty is that one cannot restate that which has not yet been definitely stated. The conflicting theories must first be evaluated and weighed before a complete code can be successful.

Torts. A tort has been defined as "a wrong independent of contract." It may be said that

the law of torts embraces the liability of individuals for the invasion of the rights of others when this liability is not based upon a contract. It includes the invasion of noncontractual rights of person and property whether the transgression is willful or negligent. One of the marks identifying a common-law tort has heretofore been the proof of some fault on the part of the defendant. A tortious wrong connoted a wrongdoer. Assuming no personal culpability, no willful or negligent action or inaction, the common-law rule was that there could be no liability without fault. If the damage was purely accidental, the maxim *damnum absque injuriâ* applied.

Exceptions are being engrafted upon the cardinal principle of no liability without fault. It is no longer true that liability presupposes a wrongdoer. Laws frequently impose absolute duties which eliminate the necessity of proving fault as an ingredient. A typical example is workmen's compensation legislation, now generally operative in the United States, which fixes liability on the employer for injuries to his employees incurred in the course of their employment. The absence of due care of the employee or the absence of negligence on the part of the employer are of no consequence. The employer is an insurer and must reimburse the injured employee. Apart from statutes, many American courts have broken down the common-law rule by holding that a person may be liable for damages due to his keeping instrumentalities which are inherently dangerous if they escape. If these agencies actually cause damage, liability follows without any proof of concurrent fault on the owner's part. Other courts stubbornly resist the expansion of the principle of liability without fault and assert that it is hostile to the course of the common law.

The pragmatic school of jurisprudence, arguing for a sociological interpretation of law, disputes the contention that liability should be premised on fault. It is said that the correct approach to the question of legal liability should be the balancing of the whole circle of conflicting social interests and the recognition of the predominant claims of society. If social progress and economic interests will be advanced by the enlargement of individual responsibility, there is no barrier against the consequent liability. The elevation of social interests, prominent in the tenets of modern legal philosophy, is a reaction against the rigid individualism of the nineteenth century. It has a proper place in the formulation of rules of legal liability. But it is possible that in our zeal to promote the general welfare we may unduly submerge the individual welfare. Excessive paternalism is just as dangerous as excessive individualism. In the judgment of many we are rapidly approaching the danger point of unwise and futile attempts to correct human failings by the compulsion of law. So also it may be suggested that the complete abandonment of the common-law principle of no liability without fault is fraught with potential harm.

It is generally stated that there is liability when there is fault accompanied by actual damage; but this proposition is sometimes debatable. A lively controversy exists regarding the right to recover damages for mental fright due to the negligent conduct of another when no di-

rect physical impact is present. Some courts contest the existence of any right to recover damages owing to the difficulty of tracing the damage and the dangers of malingering and falsification. If this practical objection can be removed, it is arguable that the form of the damage should not be an obstacle to legal redress. Medical science is progressing to the point where it is possible to distinguish between real and feigned nervous disorders. The result is noticeable in the gradual enlargement of cases allowing recovery for fright negligently or willfully caused by the defendant's conduct. A somewhat similar question arises when an unborn child is alleged to have been injured by the negligence of the defendant before birth. Has the unborn child a right to sue for damages? The almost unanimous view of the courts is that no recovery will be allowed. The practical objection is that it is impossible to prove the source of the injuries. It is also said that the unborn child is not a legal entity at the time of the injury. But this treatment of the child yet unborn as beyond the pale of legal rights has been subject to established exceptions in the criminal law and the law of property. If the cause of the damage is certain and can be traced to the willful or negligent acts of another, it is somewhat artificial to find the law protecting the property rights of an unborn child, punishing criminally prenatal killing of the child, and denying a civil remedy to the child after birth.

**Property.** The initiative and enterprise of man are dependent upon the recognition of his right to the fruits of his labor, the privilege of acquiring property from his accumulations and the guarantee that the State will protect his goods from unlawful aggression. Hence property law has its proper place in the legal order. In the development of the law of property, changes are less frequent than in other branches. There is manifest an emphasis upon certainty and rigidity in the rules governing the acquisition, enjoyment and transfer of property. This stability is necessary in order that the legal consequences of action concerning property may be definitely determinable.

But even the law of property is not wholly free from the force of external changes in the march of events. No longer can we say with Blackstone that the rights of private property cannot be invaded even for the general good of the whole community. Property is losing its individualistic coloring and is gradually becoming socialized. This does not portend the overthrow of private property, but it indicates rather the realization that the ownership of property is a trusteeship in which society has a latent interest. The owner of property is subject to the control by the State in the acquisition, use and disposition. Charitable corporations are frequently restricted as to the quantity of land which they may acquire; the use of land is dependent upon the effects of such user upon the public; and the disposition of property is subject to stringent rules against entangling provisions which tend to suspend its transferability. The "dead-hand" influence is reprobated by statutes which prohibit stipulations preventing alienation. These limitations are of ancient lineage, but their principle is visible in more recent extensions of the same fundamental principle.

The shortage of homes, incident to the War,

resulted in the passage of emergency rent legislation which took from the owners the right to fix the rental value of their properties and transferred this property right to administrative boards with power to adjust controversies between landlords and tenants. This power, operating to diminish materially the rights of ownership, was upheld as necessary in view of the public need. But it was plainly limited to the present emergency and the Supreme Court of the United States refused to continue its provisions in the absence of proof that the emergency still existed in the District of Columbia.

An event which is not without considerable interest in the development of the law of property in America is the comprehensive and fundamental codification of the English Property Law of 1922. This law aims at simplification and clarification of property rights, reduces materially the number and complexities of common-law estates and renders obsolete a great part of the classic rules of property. It is symptomatic of the general recognition that the law has lagged behind the progress of society and requires a thorough overhauling to bring it down to date. The success of the English experiment will be followed with interest in the United States and will probably arouse American jurists to initiate similar reforms.

**Law Reform.** The progress of law is indicated not only by the course of decisions and legislation but also by the movements to reform the law which are visible in society. A study of law reform serves two purposes: it portrays current shortcomings in the administration of law, and it discloses the tangible form of the proposed remedies. Four major tendencies or agencies which are destined to shape juristic development are prominent at the present time: (1) the American Law Institute, (2) uniform State legislation, (3) reformation in legal education, and (4) law enforcement.

*The American Law Institute.* One of the most widely held criticisms of the law is its present uncertainty and confusion of principles which impede the orderly and exact application of law. It is often difficult for lawyers to predict the outcome of lawsuits owing to the multiplication of diverse and overlapping rules and the inconsistent principles in different States, and sometimes even in the same State. Useless litigation is frequently the result of this confusion, or the compromise of valid claims. The remedy is to simplify and to clear away the accumulated mass of contradictory precedents; to make a new start by building up a body of legal formulas that will restore the power of predictability. The proposal is theoretically sound, but its practical accomplishment offers many difficulties.

The American Law Institute was formed to face these problems and to attempt their solution. The object of the Institute is: "To promote the clarification and simplification of the law and its better adaptation to social needs, to secure the better administration of justice, and to encourage and carry on scholarly and scientific legal work." Its members include the leading judges, lawyers and law teachers of America, and in addition an active corps of specialists who are assigned particular topics of the law for intensive study. The perplexities of the task of restating the law in clearer form are frankly admitted by the members of the Institute. But the need of the restatement

has inspired the organization to make every effort to insure the success of the work. The Institute was formally organized at a meeting held in Washington, Feb. 23, 1923. Many years must elapse before the concrete results of this important reform can be definitely determined.

*Uniform State Legislation.* The work of the National Conference on Uniform State Law deserves special mention in the consideration of legal reforms. This conference, comprising delegates from all the States, meets annually for the purpose of promoting uniformity in State laws. This is accomplished by the drafting, after careful study and analysis, of uniform statutes covering particular parts of the law. The acceptance of the drafts and their enactment by the State legislatures is purely voluntary, but the response, particularly in the field of commercial law, has been gratifying. Since these uniform acts contain many simplifications in the common-law and statutory principles, they have exercised considerable influence in ameliorating and unifying American law.

*Reformation in Legal Education.* Law schools, as the training centres of future lawyers, wield a potent influence upon the moral and intellectual calibre of the bench and bar. To an appreciable degree the standards of the lawyer and judge are formulated during their law-school course. Agitation for the elevation of the scholastic requirements in the law schools is a result of this close relation between legal education and legal practice. The American Bar Association has recommended that the study of law should be preceded by at least two years of college work. The proposal aroused some opposition on the ground that it would result in closing the doors of the law school to ambitious students; but the majority of the profession accepted the validity of the recommendation and the law schools, with few exceptions, are requiring this additional period of study.

*Law Enforcement.* It cannot be doubted that disregard of law and disobedience to law have greatly increased in recent times. This unfortunate situation is still increasing, if we may judge by statistical proof and careful surveys of the times. In an attempt to determine the causes and to find a remedy, the American Bar Association appointed a Special Committee on Law Enforcement. This committee sent out a country-wide questionnaire to prominent members of the bar and bench. The collated answers point to many causes for this breakdown of law enforcement: the demoralizing influence of war, the passage of legislation which the State is unable to enforce, the spread of irreligion, the disintegration of family life, the political influence in the administration of justice and the tardiness and technicalities of legal processes.

These multiple and varied influences complicate the task of law enforcement. Indeed, it may be safely stated that one of the primary difficulties is that the law has gradually been burdened with duties which properly should be, and in the past have been, borne by other agencies of social control. There are limitations on the efficacy of law as a means of rectifying and leveling the inequalities and hardships of societal existence. The home, school and church have their respective parts to perform in upholding the respect for authority and obedience to law. If the home is invaded with the evils of divorce, if the school fails to implant moral

principles in the youth, if the influence of the church is weakened by internal dissension, it is futile to transfer to the State the obligation of social reformation.

There are, however, regions where the law has failed to do its part. In the province of criminal law we are in need of a general simplification of procedure and substantive law. The law's delay is a potent factor in bringing about the present distrust of law. Time is of the essence in criminal and civil actions. A delay in the establishment of rights or the punishment of crimes is often as fatal as their nullification or destruction. The English practice combines speed and certainty in the detection and trial of criminal offenses. Its adoption in America would result in considerable improvement in the direction of law enforcement.

The future development of law is problematical and doubtful. There is abroad the settled conviction that the law is approaching a critical stage which necessitates a thorough reorganization. It is a hopeful augury that the legal profession recognizes the current shortcomings in the legal order and is offering concrete proposals to simplify and to clarify juridical principles. But the coöperation and support of the people are needed to restore and sustain the orderly progress of law. The sanctity and primacy of law rest upon the willing acquiescence and submission of the people, their spirit of obedience to lawful authority, no less than upon the successful installation of the stated devices of law reform. The problem for the future is not merely one of legal reformation; it also includes the preliminary and important task of social, domestic, industrial and political purification. In these larger spheres the law can assist, but it alone cannot cure the failings of humankind.

**LAWRENCE, D. H.** (1886- ). An English novelist, born at Eastwood, on the borderline between Nottingham and Derbyshire. Due partly to his own precociousness and partly to his mother's determination, he was able to attend the Nottingham High School, and when 16 years old became a teacher. He later matriculated at the Nottingham Day Training College, and taught in London. Mr. Lawrence's works, all of them illustrations of a profound study of the reactions of human nature, possess originality and the earmarks of a literary genius. His publications, too numerous to be all mentioned here, include: *Love Poems and Others* (1913); *Tortoises* (1921), a creative animal study; *The Widowing of Mrs. Holroyd* (1914), and *Touch and Go* (1920), plays; *Twilight in Italy* (1916); *Sea and Sardinia* (1921); *Psychoanalysis and the Unconscious* (1921); *The Fantasia of the Unconscious* (1924); also the novels, *The White Peacock* (1911); *Sons and Lovers* (1913); *Women in Love* (1920); *Aaron's Rod* (1922).

**LAWRENCE COLLEGE.** An institution comprising a college of liberal arts and a conservatory of music, at Appleton, Wis., founded in 1846. The student enrollment increased during the decade 1914-24 from 439 to 873 in the College, and from 175 to 510 in the Conservatory of Music, and the faculty was increased from 47 to 69 members. The endowment increased also from \$905,423 to \$1,710,000, the value of the plant from \$490,110 to \$1,193,173, and the total income from \$134,527 to \$378,537. The library, in 1923-24, contained 42,892

volumes. During the 10 years, a chapel with seating capacity of 1600, a dormitory for women costing about \$160,000, and a heating plant were built by the college, and the campus was enlarged by the purchase of adjacent property. Chairs were established in politics, sociology, and religious education, a department of commerce with two full-time and one part-time teacher was founded, and a chair of Spanish added to the faculty. President, Samuel Plantz.

**LAWRIE, LEE OSKAR** (1877- ). A sculptor born in Rixdorf, Germany. He was brought to America in infancy and was educated at the public schools and Yale University and studied sculpture under St. Gaudens and Martiny. He is a member of the National Society of Sculptors and in 1921 was awarded a gold medal by the American Institute of Architects. His work includes the sculptural decorations in the United States Military Academy at West Point, reliefs and statues for many churches throughout the country, including the Church of Saint Vincent Ferrer, for the large reredos of St. Thomas' Church, New York, and the Harkness Memorial Tower and Archway, Yale University.

**LAZZARI, SILVIO** (1858- ). A French composer, born at Bozen, Switzerland. Abandoning the study of law, he studied at the Paris Conservatoire under Franck and Guiraud. In 1885-94, he wrote for various French journals advocating the cause of Wagner. He later lived in Paris, devoting his entire time to composition. On the occasion of the world premiere of his *Le Sauteriot* (Chicago, 1918) he visited the United States. His other works include: the operas *Armor* (Prague, 1898) and *La Lépreuse* (Paris, 1912); a pantomime, *Lulu*; a ballet, *Melanie* (Paris, 1923); a symphonic poem, *Effet de nuit*; an orchestral suite, *Impressions*; a *Konzertstück* for piano and orchestra; a string quartet, an octet for woodwind and a violin sonata; piano pieces; choruses, and songs.

**LEA, FANNIE HEASLIP.** See AGEE, FANNIE HEASLIP LEA.

**LEACOCK, STEPHEN BUTLER** (1869- ). A Canadian writer and educator (see VOL. XIII). His later works include: *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Essays and Literary Studies* (1916); *Further Foolishness* (1916); *Frenzied Fiction* (1917); *The Hollenzollern in America* (1919); *The Unsolved Riddle of Social Justice* (1920); *Winsome Winnie* (1920); *My Discovery of England* (1922); *Over the Footlights* (1923); *College Days* (1923).

**LEAD.** In the decade 1914-24, there were many changes and developments in the lead industry, which embraces the mining of the ore and its smelting and refining. The industry was called upon during the War to supply lead for munitions, but the uses of this metal in times of peace were far more important, and were constantly growing with the ordinary development of industry. In the order of importance in 1924, one might rank the industrial uses of lead as pigments, storage batteries, lead sheets, cables and plumbing supplies, though of course other uses, such as printing type, could be readily suggested.

Lead is produced in many countries of the world (see Table), but the principal sources of supply are the United States, Mexico, Australia,

Spain and Germany, and of these the United States easily leads. In the United States, Missouri, Idaho, Oklahoma and Utah were the leading sources of production in 1924. Missouri supplied the soft lead ores which are comparatively free from silver, while the lead-silver-zinc ores come from Idaho. Oklahoma also supplies soft ores.

The production of red lead was a decreased production from the maximum of 1920, when the amount of red lead produced was 34,431 short tons, valued at \$7,523,089. In 1920, however, there were produced 62,329 short tons of litharge, valued at \$12,386,185. This year also witnessed the maximum imports of lead, which totaled 197,029,527 pounds. The maximum for

#### WORLD'S SMELTER PRODUCTION OF LEAD, 1913 AND 1917-1922 \*

[In metric tons, by countries where smelted, but not necessarily refined. Figures in black-faced type are official.]

#### PRODUCTION OF REFINED PRIMARY LEAD IN THE UNITED STATES

|                                 | 1918         | 1919         | 1920         | 1921         | 1922         | 1923         |
|---------------------------------|--------------|--------------|--------------|--------------|--------------|--------------|
|                                 | (Short tons) | (Short tons) | (Short tons) | (Short tons) | (Short tons) | (Short tons) |
| Domestic desilverized lead      | 282,024      | 208,701      | 220,327      | 187,962      | 185,191      | 304,595      |
| Domestic soft lead              | 210,463      | 147,744      | 189,854      | 157,513      | 209,250      | 190,749      |
| Domestic desilverized soft lead | 47,418       | 67,938       | 66,668       | 52,747       | 74,305       | 61,364       |
| Total                           | 539,905      | 424,433      | 476,849      | 398,222      | 468,746      | 556,708      |
| Foreign desilverized lead       | 100,290      | 57,787       | 52,808       | 50,367       | 63,916       | 61,300       |
| Total refined primary lead      | 640,195      | 482,220      | 529,657      | 448,589      | 532,662      | 618,008      |
| Antimonial lead                 | 18,579       | 13,874       | 12,535       | 10,064       | 8,075        | 14,190       |

In 1913, the United States produced 462,460 short tons of primary lead from domestic and foreign ores; in 1923, there was refined 629,073 short tons of primary lead, and of this amount Missouri was responsible for 169,350 short tons, or nearly 30 per cent of the total; followed by Idaho with 134,036 short tons, and Utah with 107,949 short tons. In the smelting and refining industry, the summary from the Bureau of the Census indicates the condition of the industry in the years 1914, 1919 and 1921, when the Census of Manufactures was taken.

white lead was 194,991 tons in 1922, valued at \$35,513,395.

The Pittman Act, which put a price on silver produced in the United States, until its expiration in 1923, naturally stimulated the production of lead where this metal was an important by-product.

In 1923, the United States imported a total of lead valued at \$14,613,071, distributed as follows: ore and matte, 66,882,850 pounds, valued at \$3,170,190; bullion or base bullion, 161,496,495 pounds, valued at \$8,532,423; pigs, bars

#### LEAD SMELTING AND REFINING INDUSTRY (Value in thousands of dollars)

| Year | Number of establishments | Persons engaged | Salaries and wages | Cost of materials | Value added by manufacture | Total value of product |
|------|--------------------------|-----------------|--------------------|-------------------|----------------------------|------------------------|
| 1914 | 22                       | 8,036           | \$7,629            | \$154,014         | \$17,564                   | \$171,578              |
| 1919 | 25                       | 7,354           | 11,281             | 179,373           | 17,421                     | 196,794                |

and other forms, and old lead, 42,198,848 pounds valued at \$2,384,191; manufactures of lead, excepting type metal, 400,418 pounds, valued at \$94,657; type metal, 7,353,463 pounds, valued at \$431,610.

**LEAGUE OF NATIONS.** The greatest constructive achievement of the Peace Conference at Paris was the organization and establishment of a definite agency of international co-operation designed to further concerted action both in the preservation of the future peace of the world and in the promotion of general human welfare—the League of Nations. For the origins of this significant institution, one is obliged to seek far beyond the council chambers of Paris.

During recent centuries, irresistible material forces greatly intensified by the never-ending Industrial Revolution, had broken down the last barriers of local isolation and self-sufficiency, created a world market for capital, raw materials, finished products and labor, and, by rendering all regions and all nations increasingly interdependent, had laid broad and deep the economic foundations for the possible erection of a political superstructure of internationalism. The cultural interdependence of nations was no less marked. Despite distinctive languages and national folkways, the peoples of the world had gradually developed a genuine community of intellectual and aesthetic interests strikingly revealed in periodical world conventions of distinguished physicists, chemists, biologists, historians and economists. Religious, democratic, trade-union, socialist and feminist movements were international in scope and influence. Everywhere there was a more than perceptible tendency to adopt uniform standards of clothing, food and architecture, as well as of literature, science, and politics. "Thirty nations formed the Universal Telegraph Union (1875); 23 adopted a convention regarding the common use of the metric system of weights and measures (1875); 60 adhered to the Universal Postal Union formed in 1878 with headquarters at Bern, Switzerland; five joined the Latin Monetary Union (1865); 20 ratified the Bern Convention of 1883 for the standardization of patent laws; and 12 signed the Bern Convention of 1887 providing for practically uniform copyright laws." Not unnaturally, under these circumstances, there arose in the various countries a host of pacifists who denounced war as a relic of barbarism, unmoral, un-Christian, and inimical to modern cultural progress, to normal economic intercourse and to sound political development. Peace societies first organized in England (1816), the United States (1828), Italy (1828), and France (1841), multiplied rapidly after 1878, until by 1914 there were about 160 with numerous branches and large membership. "International Peace Congresses, assembling intermittently and spasmodically between 1843 and 1889 became regular annual events after the latter date, and in 1891 permanent headquarters of the international peace movement were established at Bern." To optimistically minded pacifists, the First and Second Hague Peace Conferences (1899, 1907) seemed extremely auspicious—"the real beginning of an organized international state, with its capital in The Hague, with its regular congresses, with its statutes and codes, with its permanent court of arbitration." They failed to perceive the essential anarchy and increasing

tension of international relations, the ominous forces of nationalism, imperialism, militarism, secret diplomacy and systems of alliances potentially operating to disrupt the state-system and to produce the most stupendous catastrophe in all history—the great war of 1914–18. The precipitation of this vast conflict was a shock and a disillusionment, but to hundreds of thousands in the Allied countries, the protracted struggle gradually took on the aspects of a great and disinterested crusade for eternal peace and righteousness. It became "the war to end war."

Statesmen in all Allied countries gave voice to idealistic pronouncements regarding war aims. Premier Asquith spoke of a "real European partnership" and the passing years saw increasing coöperation on the part of the Entente governments. Of particular importance was the series of lofty addresses delivered by President Woodrow Wilson of the United States during the years 1916, 1917, and 1918. On May 27, 1916, speaking before the American League to Enforce Peace, he laid down three general principles which prefigured his international aims during subsequent years: (1) every people has a right to choose the sovereignty under which it shall live; (2) the small states of the world have a right to enjoy the same respect for their sovereignty and for their territorial integrity that great and powerful nations expect and insist upon; and (3) the world has a right to be free from every disturbance of its peace that has its origin in aggression and disregard of the rights of peoples and nations. Here was Wilson's fundamental programme enunciated a year before America entered the War; his subsequent addresses represented merely the elaboration and refinement of details. Speaking before the Senate on Jan. 22, 1917, he demanded the replacement of the old system of alliances by a general concert of powers. His war message of Apr. 2, 1917, emphasized American determination to fight for a "universal dominion of right by such a concert of free peoples" as should bring peace and safety to all nations. Finally, the project for a league was incorporated in his address of Jan. 8, 1918, as the Fourteenth Point, viz., "A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike." At the time of the Armistice this stipulation, among others, was accepted by Germany and by the Entente Powers as the basis of the future peace settlement. Wilson resolved to attend the Paris Conference in person to make sure that his project would be realized.

Organizations such as the American League to Enforce Peace and the British League of Nations Association had long been engaged in drawing up plans for keeping the peace. Men like ex-President Taft, Elihu Root, Lord Robert Cecil and Lord Bryce had given the matter careful study, examining with a fresh interest the famous schemes propounded in previous centuries by Pierre du Bois, St. Thomas Aquinas, Marsiglio of Padua, King Henri IV, the Quaker William Penn, the Abbé St. Pierre, the philosopher Immanuel Kant, Czar Alexander I, and others. A league was made part of the war-aims of the Inter-Allied Labor and Socialist Conference of February, 1918. In the spring of 1918, a committee of international lawyers

headed by Lord Phillimore, which had been appointed by the British government to study the subject, made a report formulating in legal, diplomatic phraseology what was deemed to be the practical substance of the multifarious suggestions already before the world. The report favored a guarantee of peace through compulsory arbitration or conciliation, as did the American League to Enforce Peace, but its scheme of organization for the proposed league lacked definiteness. Copies of this report being sent to the British War Cabinet, to the Dominion prime ministers, and to the President of the United States, gave rise to numerous revised drafts. During the early summer of 1918, President Wilson's confidential adviser, Col. E. M. House, rather elaborately revamped the British committee's report, providing a permanent secretariat and a court of international justice, but eliminating the sanction of military force. After considering House's plan, Wilson prepared his own first draft, conspicuously omitting the court and restoring the sanction of physical force. This draft he took with him to Paris where in addition to receiving certain suggestions from his Secretary of State, Mr. Lansing, who championed the theoretical equality of all states and favored legalistic methods of settling international disputes, he was confronted with two new projects, both British, both based in large degree upon the Phillimore report, but each with characteristic features of its own—one by General Smuts of South Africa and the other by Lord Robert Cecil. Profoundly impressed by Smuts's plan, Wilson utilized it in revising his own, taking over a whole new scheme of organization establishing a smaller executive council in addition to the general conference and secretariat proposed by previous plans, more definite ideas concerning limitation of armament, arbitration and its guarantees, and also a mandatory system for the supervision and control of conquered territory. The Inter-Allied Labor and Socialist programme of 1918 had looked forward to the international administration of all colonial empires, but Smuts, to whose mind the mandatory concept had thus been suggested, limited its scope to territories dismembered from the Russian, Habsburg, and Ottoman Empires. Wilson, attracted to the central idea which had such deep roots in historic American policy (e.g. Cuba, etc.), advocated its application to the former German colonies. Cecil's plan, which proposed domination of League activities by an executive council composed exclusively of the Great Powers, did not so much influence the President, but powerful currents of world opinion represented by the labor movement and Jewish propaganda caused Wilson to insert in his second draft provisions according more recognition to the interests of labor in the determination of world affairs and requiring all new states to grant equal rights to their "racial or national minorities." In compliance with Wilson's request, this second draft as printed and circulated on Jan. 10, 1919, brought forth a number of comments and criticisms, some of which (e.g. those submitted by General Bliss and David Hunter Miller) impelled him to prepare a new revised draft. Certain vital differences between this third Wilsonian draft and an official plan transmitted to him from the British delegation (January 19) led to the collation of the two into a composite plan by the legal advisers of the two

delegations. This so-called Hurst-Miller draft, though wholly satisfactory to neither side, provided a broad basis of agreement between them.

"Practically nothing—not a single idea in the Covenant of the League was original with the President. His relation to it was mainly that of editor or compiler, selecting or rejecting, recasting or combining the projects that came in to him from other sources. He had two great basic convictions: that a League of Nations was necessary; that it must be brought into immediate existence. . . ." In December, 1918, Premier Clemenceau of France had openly expressed his desire to retain the old system of alliances; at the same time, Winston Churchill, of the British cabinet, mouthpiece of reactionary militarism, had declared that the League was no substitute for British sea power. At Paris, the European Allies and Japan wanted the territorial, military, and economic settlements made first and in accordance with the provisions of the old secret treaties, before any attempt should be made to establish a league. The French, in listing the subjects to be considered by the Conference, placed the League last. Wilson, however, placed it first and insisted with determination that a League of Nations should be made "an integral part of the general treaty of peace." A resolution to that effect, passed by the Council of Ten on January 22, was accepted by the second plenary session three days later and a commission was appointed, composed of two representatives from each of the five great powers (United States, Great Britain, France, Italy, and Japan) and one from each of five, later nine, small powers. President Wilson became chairman of this commission, the membership of which, as ultimately constituted, embraced such leaders as Premier Orlando of Italy, Baron Makino of Japan, Cecil and Smuts of the British Empire, House of the United States, Bourgeois and Larnaude of France, Venizelos of Greece and Wellington Koo of China. Using the Hurst-Miller compromise plan as a basis of discussion, in preference to drafts submitted by the French and Italians respectively, the commission held 10 meetings, February 3-13. The French desperately endeavored to convert the projected league into a buttress of French security by advocating an international army directed by an international general staff which should execute the decisions of the League and supervise all military affairs including reduction of armaments. The Italians vehemently opposed any attempt to incorporate a provision for the abolition of conscription. The Japanese, supported in this sole instance by the Chinese, insisted upon explicit recognition of the principle of racial equality. Both the French and Japanese suggestions were rejected, however, the most important single alteration being the reinsertion of an article calling for the establishment of a Permanent Court of International Justice. A complete tentative draft of the Covenant was submitted to the second plenary session of the Conference February 14, and adopted unanimously. Meanwhile a keen struggle in the Council of Ten (January 23-30) had resulted in the reluctant acceptance of a resolution providing for the application of League mandates to the administration of former German colonies rather than cessions in absolute sovereignty as demanded by the British, the French, the Italians and the Japanese.

The struggle over the League was by no means at an end. Wilson's visit to America in late February and early March acquainted him with Senatorial opposition to the Covenant, and after consulting with his Democratic advisers and certain leading pro-League Republicans including Taft, Root and Lowell, he returned to Paris determined to secure three amendments designed to cover American criticism. They included: (1) specific recognition of the Monroe Doctrine; (2) provision for voluntary withdrawal of any state (e.g. America) from the League upon stipulated notice; and (3) specific exclusion of domestic questions from purview of League activity. Arriving at Paris, March 14, Wilson quickly repudiated the attempt which had been made during his absence to impose preliminary general peace terms upon the enemy without immediately establishing the League. His desire to have the Covenant amended reopened the former struggle with the French and Japanese over their respective plans for an international military organization and recognition of racial equality. Even the British keenly opposed specific recognition of the Monroe Doctrine but they were eventually won over and, through a personal understanding with Clemenceau over the other French claims before the Conference, Wilson secured sufficient backing to have his amendments adopted and French and Japanese proposals rejected. After five night sessions held from March 22 to April 11 during the most critical period of the Conference, revision of the Covenant was finally completed by the Commission, and on April 28 it was accepted by the fourth plenary session for subsequent incorporation as the first section in each of the major treaties of peace.

The Covenant of the League of Nations as thus framed was a comparatively brief document setting forth in 26 articles the rights, obligations, and privileges of the member states. The 32 Allied and Associated Powers convened at Paris (see PEACE CONFERENCE AND TREATIES), of whom the United States, Ecuador, and Hedjaz alone subsequently refused to join, were designated as original members, and 13 neutral states, viz, Argentina, Chile, Colombia, Denmark, the Netherlands, Norway, Paraguay, Persia, Salvador, Spain, Sweden, Switzerland, and Venezuela, were invited immediately to accede to the Covenant. The desire of the British and Americans forthwith to admit the enemy powers was frustrated by the opposition of France and Belgium. Certain other states—notably Russia and Mexico—whose governments had not been formally recognized by the Powers generally were also temporarily excluded. Provision was made for the admission of any fully self-governing state, dominion or colony as a new member by a two-thirds vote of the General Assembly of the League, and for the withdrawal from the League of any member on two years' notice, "provided that all its international obligations and all its obligations under this Covenant shall have been fulfilled." In accordance with the former provision, Austria and Bulgaria as well as Finland, Luxemburg, Costa Rica and Albania were admitted to membership in December, 1920; Esthonia, Latvia, and Lithuania in September, 1921; Hungary in September, 1922; and Abyssinia and the Irish Free State in 1923. The nine principal sovereign states still outside the League in June, 1924, were Afghanistan, Ecuador, Egypt, Germany,

Mexico, Russia, Santo Domingo, Turkey and the United States.

Three organs of administration and control and one judicial organ were to be established; namely, an Assembly, a Council, a Permanent Secretariat and a Permanent Court of International Justice. The Assembly was to meet at stated intervals at the seat of the League and was empowered to deal with any matter within the purview of the Covenant, each member state, including the British Dominions, being entitled to only one vote in its meetings though privileged to send at most three representatives. The Council was to consist of representatives of nine states comprising, first, five permanent members—the United States, the British Empire, France, Italy, and Japan—and secondly, four others to be selected or superseded by the Assembly "from time to time at its discretion," the first nonpermanent members being provisionally designated by the Covenant as Belgium, Brazil, Spain, and Greece. Each state represented on the Council was to have only one delegate and only one vote. Additions to either of the two classes of members—permanent and nonpermanent—might be made by the Council if such action secured the approval of the Assembly, and it was also stipulated that any member of the League might be represented at meetings of the Council whenever any matter specifically affecting its interest should come up for consideration. Parties to disputes were to have no vote, however, and decisions by the Council normally had to be unanimous. The Permanent Secretariat, comprising a Secretary General and such secretaries and staff as might be required, was to be established at Geneva, the first seat of the League.

The purposes of the League as set forth in the preamble to the Covenant were "to promote international coöperation, and to achieve international peace and security." The Covenant embodied pointed endeavors to mitigate or eliminate the general forces alluded to above as operating to cause wars in the state system, namely nationalism, militarism, imperialism, secret diplomacy and systems of alliances, and also to provide agencies for the settlement of specific disputes between nations. To this end the signatory powers pledged themselves (Article X) "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The members of the League recognized that the maintenance of peace required the "reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations." To the Council was intrusted the important function of formulating decennial plans for the reduction of armaments, which having once been accepted by the particular governments concerned were not to be changed without the consent of the Council. The Council was also empowered to suggest means for preventing the evils attendant upon the manufacture by private enterprise of munitions and implements of war. Members of the League undertook to interchange full and frank information as to the scale of their armaments and their military, naval and aeronautical programmes.

Any war or threat of war, whether directly affecting any member or not, was declared to be a matter of concern to the whole League,

and at the request of any member, a meeting of the Council should be summoned forthwith. Each member possessed the friendly right of calling the attention of the Assembly or of the Council to any circumstance threatening international peace or good understanding. Members of the League were pledged to submit all potentially dangerous disputes, which could not be satisfactorily settled by diplomacy, either to arbitration or to inquiry by the Council and in no case to resort to war until three months after the award of the arbitrator or the report of the Council. The Permanent Court of International Justice, for whose establishment provision was made, was to be endowed with power to determine any international dispute submitted to it by the contestants and also to give an advisory opinion on any matter referred to it by the Council or by the Assembly. Dangerous disputes not settled by diplomacy, or submitted to arbitration, were to be referred to the Council or through it to the Assembly, and if all efforts at conciliation failed, the facts and recommendations were to be published. Members obligated themselves not to go to war with the party to the dispute which accepted the suggestion of the conciliating agency, but any member resorting to war in violation of its covenants was *ipso facto* to be deemed to have committed an act of war against all other members, who bound themselves immediately to sever all commercial, financial and personal relations with the nationals of the covenant-breaking state and to prevent any intercourse between that state and any other state whether a member of the League or not. The Council was invested with the duty of recommending what effective contribution each member of the League should contribute to the armed forces to be used to protect the covenants of the League. In the event of a dispute between a member of the League and an outside state, or between two or more nonmember states, the League was to offer its services; and if the invitation should be rejected and a member of the League attacked, all other members were to come to its aid.

The Covenant expressly affirmed the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace, but all other obligations or understandings inconsistent with the terms of the Covenant were to be abrogated, the Assembly being empowered to advise the reconsideration of treaties which had become inapplicable. A blow was dealt to secret diplomacy by the requirement that henceforth every new treaty or international engagement should be forthwith registered with the Secretariat and published by it; and no such pact was to be considered binding until so registered.

As territorial greed and colonial rivalries had been prolific causes of war in the past, the Covenant provided a new system for controlling the German colonies and dismembered portions of the Turkish Empire which were not to be divided among the victors as spoils but administered as sacred trusts of civilization for the benefit of the peoples concerned. The various areas were to be intrusted to various members of the League under mandates prescribing the degree and kind of authority that they might exercise, guaranteeing certain rights to the natives and requiring annual reports from the

mandatories. In other ways the League was inextricably interwoven with the general peace settlement. To it were intrusted the administration of international areas, such as the Saar Basin (q.v.) and the Free City of Danzig (q.v.) and the conduct of certain plebiscites such as those in North Schleswig, Allenstein and Marienwerder, and Upper Silesia (qq.v.).

Members of the League pledged themselves to coöperate in the reciprocal establishment of freedom of transit and equitable treatment for commerce in the improvement of labor conditions, the international prevention of disease and mitigation of suffering, the suppression of the arms traffic, the traffic in women and children, and in opium and other dangerous drugs. To the League were to be transferred all international bureaus and commissions. Provision was made for the amendment of the Covenant at any time by a unanimous vote of the Council and by a majority of the Assembly, though the somewhat faulty drafting of the Covenant was manifested by omission of any reference to ratifications.

The League of Nations formally came into existence on Jan. 10, 1920, with the exchange of ratifications of the Treaty of Versailles. During the years 1920-24 League activities developed along three main lines: (1) establishment and operation of its organs of administration and control; (2) the promotion of general international welfare; and (3) the partial elimination of general causes of war and the attempted solution of certain specific disputes arising between nations.

First convened on Jan. 16, 1920, the Council, up to June, 1924, held 28 sessions in various places. Official rules of procedure were early adopted and the Council rapidly demonstrated itself to be a flexible organ of action well adapted to the requirements of a constantly changing situation. The passing years witnessed a notable expansion of its agenda from three items at the first session to about 75 in 1924. In 1922, with the subsequent approval of the Assembly, the Council increased its nonpermanent membership from four states to six, the permanent members, due in part to the continued abstention of the United States, being thus outnumbered six to four. It became the practice of the Assembly to elect its representatives to the Council annually, though the same state might be reelected indefinitely. Greece was on while Venizelos was in power; Sweden's election (1922) indicated that Premier Branting represented a widely held point of view; China, designated in 1920, was dropped when Wellington Koo returned to Peking; and Czechoslovakia was added (1923) because Eduard Benes exercised influence and commanded confidence outside of his own country. The states elected at the fourth annual meeting of the Assembly (September, 1923) were Belgium, Brazil, Czechoslovakia, Spain, Sweden and Uruguay. In September, 1923, the Council decided that henceforth regular sessions would be held quarterly, in March, June, September, and December.

The Assembly first met during November and December, 1920, at which time it was decided that future sessions should be held annually in September. Though not possessing the flexibility and initiative of the Council, the Assembly came to occupy a place of considerable importance in the League. Its membership has

embraced men of experience in public affairs, often endowed with keen powers of criticism and in some cases real constructive ability—premiers, foreign ministers, members of parliaments and diplomatic corps. By prescription in the Covenant and by practice the Assembly came to perform three duties exclusive to it, i.e. passing the annual budget, admitting new members, and electing nonpermanent members of the Council. Annual reports of the work of the Council and Secretariat submitted to the Assembly for review, criticism, and approval, elicited discussions constituting an extremely useful appraisal of international progress and a challenging conspectus of world opinion upon important questions.

By an annex to the Covenant, Sir Eric Drummond, of Great Britain, was named first Secretary General and during the next four years an elaborate but highly efficient and flexible Secretariat was developed under his direction. The Secretariat was charged with the task not only of preparing the work and executing the decisions of the Council and Assembly, but also of placing at their disposal extensive, detailed, specific, and up-to-date information upon the various topics and problems confronting one or the other. An admirable organization was developed to direct the multifarious and intricate activities falling under its supervision, the Secretariat being divided into 10 technical sections and six administrative departments with a technical staff comprising about 300 experts of 30 different nationalities. Nearly 500 public and private international agencies and commissions had also been placed under the ægis of the League.

In February, 1920, an advisory commission of 12 eminent international jurists was appointed by the Council to draft a statute organizing the Permanent Court of International Justice authorized by the Covenant (Article 14). With the exception of the provision for obligatory jurisdiction and certain minor details, their report was approved by the Council during the summer of 1920 and adopted by the Assembly at its first meeting. Thirty-six nations made a futile effort to secure compulsory jurisdiction for the new court, but the Great Powers refused to engage themselves to submit all justiciable disputes thereto, although subsequently numerous smaller states signed an additional optional clause for compulsory jurisdiction, or entered into mutual agreements to that effect. "The jurisdiction of the Court," ran Article 36 of the statute creating it, "comprises all cases which the parties refer to it and all matters specially provided for in the Treaties and Conventions in force." The new court was designed to be an impartial, permanent judicial organ, capable of settling international disputes of a purely legal character without the intrusion of political considerations. It was not intended to duplicate or supersede the Court of Arbitration created by the First Hague Peace Conference (1899). The two courts continued to exist side by side, the old court having the function of "arbitrating" a difficulty, the new one the function of deciding what law applied in any given case. It was not intended, as were the Council and Assembly, to devise arrangements, adjustments, and compromises as a method of harmonizing conflicts between states, but simply to interpret, explain, and apply international laws and conventions. Following a

suggestion made by Mr. Root of the United States, the statute provided for the election of judges for a term of nine years by an absolute majority in the Council and Assembly voting separately, thereby appeasing the demands of both large and small states for commensurate powers of choice. In September, 1921, 11 judges including Prof. John Bassett Moore of the United States, and four deputy judges were chosen in this way. The first regular session of the Court was opened at its permanent seat (The Hague) on June 15, 1922. During the first two years of its existence it functioned very satisfactorily, rendering nine opinions on difficult controversies submitted to its jurisdiction. Eight of these decisions were technically "advisory opinions" on contentious questions submitted by the Council of the League of Nations, viz.: (1) Whether Netherlands had complied with article 389 of the Versailles Treaty in nominating a workers' delegate to the International Labor Conference (decision, affirmative); (2) Whether the competence of the International Labor Office (q.v.) extends to agricultural labor (decision, affirmative); (3) Whether the competence of the same body extends to methods of agricultural production (decision, negative); (4) Whether the British-French dispute regarding French nationality decrees in Tunis and Morocco was a domestic matter which France under Article 15 of the Covenant could refuse to arbitrate, or an international matter subject to arbitration (decision, in favor of France); (5) Whether articles 10-11 of the Treaty of Dorpat placed Russia under legal obligation to Finland regarding the autonomy of Eastern Karelia (as Russia had not accepted its jurisdiction, the Court refused to give any opinion); (6) Whether Poland had the right to oust certain German colonists (decision against Poland); (7) Whether the Minority Treaty signed by Poland entitled the League to deal with Poland's refusal of Polish nationality to certain German residents (decision, affirmative); (8) Whether the decision of the Conference of Ambassadors, July 28, 1920, settling the boundary between Poland and Czechoslovakia in the Jaworzina (Zips) district was definite and final (decision, affirmative). Of different nature was the suit for 165,749.35 francs damages brought by England, France, Italy, and Japan against Germany for refusing to allow the steamship *Wimbledon* to pass through the Kiel Canal; the decision, unfavorable to Germany, awarded the plaintiffs 25,000 francs less than they had claimed, and was of considerable significance for the future regulation of international canals in time of war.

Up to 1924, perhaps the chief service performed by the League of Nations had been the promotion of international welfare. Its humanitarian work proved varied and efficient, and by extensive technical investigations it threw much light upon unsolved social and economic problems. In restricting the traffic in opium and other dangerous drugs, in convoking an international assembly to deal with the white slave traffic and establishing an advisory committee to supervise the enforcement of the convention adopted, in creating a commission on intellectual coöperation, and perhaps most notably of all in organizing international coöperation to combat epidemics and promote medicine and sanitation, the League so well demonstrated the practicability of humanitarian international-

ism that some nonmembers gave their full coöperation and even the United States, though opposed to the League, accorded quasi-official collaboration. More important, perhaps, in general estimation, was the success of the League in the economic reconstruction of bankrupt Austria, a success followed by plans for League control of Hungarian finance. The function of eliminating the general causes of war and of settling specific disputes between nations had been less successfully fulfilled. In its endeavors to secure a reduction of armaments the League was handicapped by the intransigence of certain Great Powers, though its investigations and recommendations on the subject proved enlightening and helpful (see WASHINGTON CONFERENCE). The supervision of mandated territories (see PEACE CONFERENCE AND TREATIES) proved moderately beneficent and efficient. A controversy between Finland and Sweden over the Åland Islands (q.v.) was successfully adjusted; the intervention of the League in the Albanian question was rewarded by a considerable measure of success (see ALBANIA), as were also its services in partitioning Upper Silesia between Poland and Germany. A dispute between Poland and Lithuania over Vilna (q.v.) was less satisfactorily dealt with, though a dispute between the same two nations over the port of Memel (q.v.) was decided in March, 1924. The League was practically defied by Italy (q.v.) during the Corfu incident (August–September, 1923), and its services were not utilized in connection with the two major armed conflicts which had raged since 1919—the Russo-Polish War and the Græco-Turkish War. The explanation for the undoubted impotence of the League in these and other instances is to be sought in the fact that the Allies strove, rather unsuccessfully, to deal through the Council of Premiers rather than through the League, with questions arising from the peace settlement.

With the advent to power of new governments in Great Britain (q.v.) and France (q.v.) the outlook for the League of Nations perceptibly brightened, for the Socialist premiers, MacDonald and Herriot, announced their intention of making more extensive use of its services. Simultaneously, the widespread accordance of *de jure* recognition to Soviet Russia paving the way for eventual admission to the League, the probability that Germany might shortly be admitted, and the appearance of a strong movement in the United States favoring adhesion to the Permanent Court of International Justice and possible entrance into the League itself; all seemed to prefigure a more auspicious future for the newly devised instrument of international coöperation. See PEACE CONFERENCE AND TREATIES; LABOR ORGANIZATION, INTERNATIONAL; UNITED STATES; GERMANY; GREAT BRITAIN, etc.

**LEATHER.** The leather industry in the United States in the period from 1914 to 1924 underwent many vicissitudes in which the production of live stock, the demands due to the War and the general change in business and industrial conditions figured. The United States ranked first among the nations of the world in the production of leather, inasmuch as its total production of finished leather was estimated to be equal to that of all the rest of the world combined. However, the production of cattle-hides, calf-skins and sheep-skins did

not increase proportionately with the demand for leather, and American tanneries were forced to import a considerable amount of material. For example, in 1923 while there was a large production of hides, yet almost 45 per cent of the raw material entering into the manufacture of leather was imported, with the exception of goat-skins, of which 98 per cent were imported. Normally, in the United States there is a greater production of leather than the domestic markets can consume and this production must be taken care of by substantial exports, which in 1919 reached a peak value of \$218,783,300. It is apparent, therefore, that the condition of this industry is more or less connected with world conditions, and in few American industries are there such serious fluctuations as in those connected with the production of leather.

In the United States, the finished product of the tanning industry consists of whole hides, sides, backs, bends, butts and offal, or skins, and the four main groups of finished leather products divided into: (1) sole, belting, side, upper, patent, harness, back and upholstery; (2) calf and kip upper leather; (3) goat and kid upper and fancy leather; (4) sheep and lamb upper, lining and fancy leather. The tanning industry, according to the Bureau of the Census, 1921, ranked 10th among the 14 leading industries of the United States when considered from the viewpoint of the total value of the product. As already stated it is necessary for the United States to import approximately 50 per cent of the calf-skins, 30 per cent of the calf-hides, 99 per cent of the goat-skins and 63 per cent of the sheep-skins used in its tanning industry; or, in other words, fully 50 per cent of the hides and skins entering into international trade are taken by the United States, exclusive of those originating in the country.

In 1922, the American tanning industry consumed approximately 132,000 hides and skins, of which 81 per cent was used in the production of shoe leathers, 9.8 per cent in fancy book-binding and kindred leathers, 6 per cent in glove leather and 3.2 per cent in belting, bag, harness and upholstering leather. The consumption of the various hides and skins in 1922 was as follows: cattle hides, 274,000; calf- and kip-skins, 15,835,000; goat- and kid-skins, 48,814,000; sheep, lamb and cabretta, 39,886,000, and other hides and skins, 3,248,000.

The American leather production in the period from 1914 to 1922, as summarized by the Bureau of the Census, is given in the table.

COMPARATIVE TABLE OF AMERICAN  
LEATHER PRODUCTION  
(Figures represent thousands)

| Classes                               | 1914   | 1920   | 1921   | 1922   |
|---------------------------------------|--------|--------|--------|--------|
| Sole leather, sides.....              | 18,075 | 18,392 | 18,062 | 17,700 |
| Belting leather, butts..              | 647    | 1,677  | 1,195  | 991    |
| Side upper and patent,<br>sides ..... | 10,036 | 16,216 | 14,872 | 22,976 |
| Harness leather, sides..              | 2,777  | 1,153  | 811    | 1,380  |
| Bag, case, and strap, sides           | 1,004  | 626    | 820    | 1,286  |
| Upholstery, hides.....                | 654    | 327    | 413    | 720    |
| Calf and kip, skins....               | 16,067 | 10,900 | 14,888 | 15,634 |
| Goat and kid, sides ....              | 37,775 | (a)    | 35,058 | 48,814 |
| Sheep and lamb, skins..               | 42,038 | 29,987 | 29,320 | 40,951 |

\* Production figures not available for this year.

The only comment necessary in connection with this table is the statement that the production of hemlock sole leather had declined from 10,-

000,000 sides in 1904 to 70,000 sides in 1922, owing largely to the development of the tanning and shoe industries in the British Colonies and Dominions, which rendered unnecessary this leather that was formerly used chiefly in shoes for the British Colonial trade. On the other hand, there had been increased production in oak and union sole leather. From 1904, when nearly 4,400,000 sides were used in harness leather, or 12 per cent of the total sides tanned, there was a decline, so that in 1922 harness leather amounted to but 1,380,000 sides, or 3 per cent of the total sides tanned, owing obviously to the decreasing production of harness leather on account of the use of automobiles and tractors and the liquidation of war stocks. See **BOOTS AND SHOES**.

**LEBANON, GREATER.** See **SYRIA**.

**LE BARON, WILLIAM** (1883- ). An American editor and playwright, born at Elgin, Ill. He studied at the University of Chicago and at New York University, and served as editor of *Collier's Weekly* and of *Cosmopolitan* productions. He was the author of several successful plays, including *The Very Idea*; *Her Regiment*; *Back to Earth*; *Apple Blossoms*; *Nobody's Money*; *The Scarlet Man*, and *The Love Letter*.

**LE BON, GUSTAVE** (1841- ). A French anthropologist (see **VOL. XIII**). His most important recent works are: *La Vie des Vérités* (1914); *Enseignements Psychologiques de la Guerre Européenne* (1915); *Premières Conséquences de la Guerre: Transformation Mentale des Peuples* (1916); *Hier et Demain: Pensées Brèves* (1918); *Psychologie de l'Éducation* (1917); *Psychologie des Temps Nouveaux* (1920).

**LE CHATELIER** **PRINCIPLE.** See **CHEMISTRY, PHYSICAL**.

**LECOINTE, SADI** (?- ). A French airman who made a new altitude record in 1923 (October 30) at Issu-les-Moulineaux, France. He rose 36,555 feet in a Nieuport Delage plane *Hispano*, breaking the 1921 record made by Lt. J. A. Macready, U. S. A. To the middle of 1924, Lecoite had made 19 world's records. He was an Officer of the Legion of Honor.

**LEE, JAMES MELVIN** (1878- ). An American editor, born at Port Crane, N. Y. He was graduated from Wesleyan University in 1900 and in 1901-02 taught at the Western Reserve Seminary in Ohio. He then entered the newspaper business and was editor of many periodicals, including *Outing*, *Leslie's Weekly*, and *Judge*. He was lecturer on journalism at the New York University in 1910-11, and in the latter year became director of the department of journalism in that university. He wrote *How to Be Self-supporting at College* (1903); *History of American Journalism* (1917); *Opportunities in the Newspaper Business* (1919).

**LEEWARD ISLANDS.** A group of islands in the British West Indies, constituting a colony. They comprise Antigua, Montserrat, St. Christopher and Nevis (usually called St. Kitts), a part of the Virgin group, Dominica, and their dependencies. Total area, 715 square miles; population, 122,242 in 1921 (127,193 in 1911). The leading products continued to be sugar, molasses, lime-juice, coconuts, and fruits. Imports for 1913-14, 1920 and 1921 were £588,362, £1,527,889, and £1,059,312. Exports for the same years totaled £563,963, £1,781,361, and

£970,694. Revenues and expenditures of government follow for 1921-22 (1913-14 figure in parentheses): revenue, £260,671 (£174,331); expenditure, £303,575 (£171,128); public debt, on Mar. 31, 1922, £250,850 (£244,689).

**LE GALLIENNE, EVA** (1899- ). An actress born in London, England, the daughter of Richard Le Gallienne. She was educated in France at the Collège Sevigné and started her stage career in London at the Prince of Wales Theatre there in 1915 in *The Laughter of Fools*. The next year she went to New York and gave her first American performance in *The Melody of Youth*. Other successes included: *McLazarus* (1916-17); *Off Chance* (with Ethel Barrymore 1917-18); *Not So Long Ago* (1920-21); *Liliom* (1921-22); *The Swan* (1923).

**LEGINSKA, ETHEL** (real name LEGGINS) (1883- ). An English pianist, born at Hull. After studying four years at the Hoch Conservatory in Frankfurt, she continued her studies with Leschetizky in Vienna for three years more. Her successful début in London was followed by extended tours of Europe. She made her American début in New York (January, 1913), but did not establish herself as a really great pianist until the next year, when she began to play colossal programmes, well calculated to show her transcendent technic and masculine power. Overwork brought on a nervous breakdown in 1917, obliging her to retire temporarily from the concert stage. During her convalescence she became fired with the ambition to win laurels as a composer, and for this purpose studied composition with Ernest Bloch in New York. She returned to the concert stage in 1921, but her appearances after that time were rather infrequent. Her compositions, which are decidedly futuristic, consist of songs, pieces for piano, *Four Poems* (after Tagore) for string quartet, and a symphonic poem, *Beyond the Fields We Know*.

**LEGION, AMERICAN.** A society of veterans of the War in Europe, organized Mar. 17, 1919, in Paris, France, by members of the Army and Marine Corps serving with the American Expeditionary Forces. On Sept. 16, 1919, it was incorporated by Act of Congress, declaring itself to be "patriotic, nonpartisan, nonpolitical, non-military, and permitting no distinction due to rank or place of service." Membership was open to any soldier, sailor, or marine who served honorably between Apr. 6, 1917, and Nov. 11, 1918, and women enlisted or commissioned in any branch of service during that period. The Legion held its first national convention at Minneapolis, Minn., Nov. 10-12, 1919. It adopted a constitution, elected Franklin D'Olier, of Philadelphia, national commander, and began its career as an established body.

It immediately entered on an aggressive campaign against political radicalism, draft evaders, slackers, and propagandists of subversive political doctrines. This activity brought it into frequent clashes with the radical element in which several Legionnaires lost their lives. For a time there was an estrangement between the Legion and several branches of organized labor, but this breach was healed. In 1920 Samuel Gompers, president of the American Federation of Labor, endorsed the Legion and urged union members to join it. In 1919 it began a campaign for a military policy based on the selective draft in time of war, with a navy

second to none and a small Regular Army in time of peace, but with an organized and completely officered peace-time reserve capable of expansion to a strength of 4,000,000 in war time. This was the basis of the Defense Act which became a law in 1920. In 1924 the Legion advocated legislation controlling prices in war time and effecting an industrial mobilization calculated to minimize profiteering. In 1922 the Legion conducted an investigation of war-time profiteering which resulted in many prosecutions and the recovery of several millions of dollars from war contractors to the public treasury. It made special efforts for the relief of wounded and disabled veterans and for the dependents of its deceased members. It condemned the government agencies dealing with these problems in 1919 and 1920 as incompetent and neglectful and in some instances built its own hospitals for veterans. It recommended the consolidation of scattered government agencies of relief into one body, which was done in 1921 when the United States Veterans' Bureau was created. It organized and maintained a nationwide organization, with representatives in every State to inspect hospitals, sanitoriums, and training centres in which disabled veterans are recuperating, and to act as counsel for veterans presenting claims before the Veterans' Bureau.

The Legion was instrumental in organizing veterans' associations in other Allied countries. In Great Britain five veterans' societies united to form the British Legion, modeled closely on the American organization. The Legion was instrumental in forming and extensively financed the Fédération Interalliée des Anciens Combattants, a union of veterans' societies of the Allies. The chief aim of the F. I. D. A. C. is to promote international peace by gradual mutual disarmament among nations. The American Legion urged drastic restriction of foreign immigration until such time as America's present foreign population can be taught the English language and brought into conformity with American traditions, ideals, and standards of life. It favored the perpetual total exclusion of Orientals. At its first convention it demanded of the government measures that should relieve service men and women of financial disadvantages incident to their service. This was the inception of the Legion's fight for an adjusted compensation or bonus law, which finally was passed over the veto of President Coolidge in 1924.

The Legion's second national convention was held at Cleveland in 1920. Frederic W. Galbraith, Jr., of Cincinnati was elected national commander. Mr. Galbraith was killed in a motor car accident at Indianapolis in June, 1921, and John G. Emery, of Grand Rapids, Mich., was selected to complete his term, by the National Executive Committee of the Legion, the ruling body of the organization between national conventions. In 1921 the Legion's national convention was held in Kansas City. Hanford MacNider, of Mason City, Iowa, was elected national commander. The American Legion Auxiliary, composed of mothers, wives, sisters, and daughters of Legion members or of deceased veterans, was organized, and Mrs. Lowell F. Hobart was elected president. In 1923 the fourth national convention was held at New Orleans. Alvin M. Owsley, of Denton, Texas, was elected commander and Mrs.

Kate Waller Barrett of Alexandria, Va., president of the Auxiliary. In 1924 the fifth convention was held, at San Francisco. John R. Quinn, of Delano, Cal., was chosen commander, and Mrs. Franklin Lee Bishop of Leicester, Mass., was elected president of the Auxiliary. The national headquarters of the Legion were in Indianapolis, Ind. In 1924 the organization embraced 68 departments located in the 48 States, the District of Columbia, and 19 outlying possessions and foreign countries. In these departments were situated 11,100 posts, the smallest units of the organization. Departments and posts chose their own officers. National membership in the Legion was granted to all paying national dues yearly, as distinguished from post and department dues. National membership in 1919 was 450,000; 1920, 800,000; 1921, 750,000; 1922, 700,000; 1923, 665,000; 1924 (estimated), 725,000. M. James has chronicled the organization in his *History of the American Legion*.

**LEGUIA**, AUGUSTO B. (1863- ). A Peruvian statesman (see Vol. XIII). In 1919, he was chosen President of Peru for the term 1919 to 1924, succeeding Dr. José Pardo who was made prisoner by the Peruvian troops as the result of the disputed election of May 18. Although assuming the position by a *coup d'état* on July 4, 1919, Leguia's election was afterwards confirmed and legalized by the Peruvian Congress. He was accused by some of his countrymen of being a despot.

**LEHIGH UNIVERSITY**. A nonsectarian institution for the higher education of men at Bethlehem, Pa., founded in 1866. The student enrollment increased from 672 in 1914 to 1056 in 1923-24, the faculty from 75 to 107 members and the library from 133,200 to 155,000 volumes. The productive endowment in 1914 was \$1,314,000, and the income \$240,000, as compared with an endowment of \$3,000,000 and an income of \$551,085 in 1922-23. Taylor Gymnasium, and Coppée Hall, named in memory of the first president of the university, Dr. Henry Coppée, were built in 1914, an extension to the chemistry laboratory was completed in 1920, and the Alumni Memorial Administration Building, a memorial to the men of the university who died in the War, was completed in 1924. Evening schools in business administration and naval architecture were established in 1920, and in 1923 a university health service, providing dispensary service and annual physical examination for all students, was opened. An endowment campaign for \$4,000,000 was started in 1923. Charles Russ Richards, M.M.E., Eng.D., LL.D., succeeded Henry Sturgis Drinker, LL.D., E.M., as president in 1922.

**LEITH**, CHARLES KENNETH (1875- ). An American geologist, born at Trempealeau, Wis. He studied at the University of Wisconsin, and in 1900, became assistant geologist with the United States Geological Survey, which position he held until 1905. Meanwhile he was called to the University of Wisconsin, where in 1903 he became full professor of geology. In 1905, he became lecturer on pre-Cambrian geology at the University of Chicago. Dr. Leith specialized on pre-Cambrian, structural, metamorphic, and economic geology, and is an accepted authority on the iron districts of the United States and on the origin of iron ores. During the War he was an adviser on minerals to the United States Shipping, War Trade, and

War Industries Boards (1918) and later (1919) to the American Commission to Negotiate Peace in Paris.

**LELAND STANFORD JUNIOR UNIVERSITY.** See STANFORD UNIVERSITY.

**LEMBERG.** See GALICIA; UKRAINE.

**LENGLEN, SUZANNE.** (?- ). Tennis player, born near Paris, France. She won the women's Olympic singles championship in 1920 and has since been recognized as the greatest woman tennis player the game has ever known. Because of ill health she was unable to defend her laurels in 1924 either at the English championships at Wimbledon or the Olympic Games at Paris.

**LENIN, NIKOLAI (VLADIMIR ILYITCH ULYANOV)** (1870-1924). A premier of Russia and leader of the Bolsheviks. He was born at Simbirsk on the Volga, the son of a counselor of state of the Government of Simbirsk. He was Greek Orthodox by religion, educated at the Simbirsk Gymnasium and the University of Kazan, and became prominent after 1890 as a leader of the radical Social Democrats. In 1897, he was exiled to Siberia for three years, and in 1900 left Russia, becoming a member of the Central Committee of the Social Democratic party, and a leader of the Russian émigrés. In 1914 he went to Switzerland, and from there advocated sabotage and armed revolt against the War. He returned to Russia, and when the Kerensky régime was overturned in November, 1917, assumed control of the government of the People's Commissars. The Russian people wanted peace, and he promised it to them. They wanted revenge for wrongs suffered by them and were bent on destroying everything. Lenin told them to take the land and the buildings for themselves—that they were the real owners. The people would not destroy their own property, and in this way about 75 per cent of Russia's wealth was saved. Later, because of the ignorance of the peasants, he encouraged individual initiative in agriculture and industry. At the end of 1921, Lenin became very ill, and for two years was unable to take active part in the administration of the government, and others governed in his name. He died early in 1924. Lenin published several books and pamphlets which attracted much attention. Among his earlier publications are *Two Tactics* (1905) and *Materialism and Empiric Criticism* (1909). See RUSSIA.

**LENTELLI, LEO** (1879- ). A painter and sculptor born in Bologna, Italy, who is instructor of drawing at the Art Students' League, New York. He is best known for his figure of the Savior and 16 figures for the reredos of the Cathedral of St. John the Divine, New York. He also designed groups for the Panama-Pacific International Exposition in San Francisco in 1915. Among his awards was the gold medal for sculpture offered by the New York Architectural League in 1922. He became a member of the National Society of Sculptors in 1907.

**LEONARD, ADNA WRIGHT** (1874- ). An American bishop, born at Cincinnati, Ohio. He was graduated from New York University in 1899 and from the Drew Theological Seminary in 1901. In 1889, he was ordained to the Methodist Episcopal ministry and held pastorates at Porto Rico, Rome, and several cities in Ohio. From 1910 to 1916, he was pastor in Seattle, Wash. In the latter year he was elected bishop.

He is the author of *The Shepherd King* and *Evangelism in the Remaking of the World*.

**LEONARD, BENNY** (1896- ). Professional boxer born in New York City. He began his boxing career in 1912 and five years later won the world's lightweight championship through his defeat of Freddy Welsh of England. He has taken part in two hundred bouts and for six years has successfully defended his world's title against all comers.

**LEONARD, WILLIAM ELLERY** (1876- ). An American educator, born at Plainfield, N. J. He was graduated from Boston University in 1898 and took postgraduate courses at Harvard, at Boston University, and in Germany. He served as instructor and principal in several high schools in New York and in Massachusetts, and in 1906 was appointed instructor of English at the University of Wisconsin. He was successively assistant professor and associate professor of English in that university. He was a member of many learned societies and was the author of *Sonnets and Poems* (1906); *The Poet of Galilee* (1909); *The Lynching Bee and Other Poems* (1920). He also translated many important plays and works from foreign languages.

**LEONI, FRANCO** (1864- ). An Italian composer, born at Milan. He studied at the Milan Conservatory under Dominiccetti and Ponchielli. In 1892, he moved to London. He owes his reputation mainly to his very successful opera *L'Oracolo* (London, 1905; New York, 1915). His other operas are *Raggio di Luna* (Milan, 1888), *Rip Van Winkle* (London, 1897) and *Ib and Little Christina* (London, 1901). He also wrote the cantatas *Sardanapalus*, *The Gate of Life* and *Golgotha*, and composed many songs.

**LEPROSY.** Within the decade 1914-24, an attempt was made to place leprosy almost among the curable diseases, although for centuries it has held its position as one of the 100 per cent fatal maladies. This attitude must not be misunderstood, for the numerous leper hospitals and asylums of the world still contained their normal quota of incurable patients, and doubtless this will be the case for a generation or more to come. The comparatively hopeful attitude was based on several truths, the importance of which was realized fully. Mild incipient cases in young subjects show a certain tendency to self-limitation and the application of combined hygienic resources is alone sufficient to produce the arrest and relative cure of certain cases. In the third place, the drug chaulmoogra oil, and more recently its active principles when isolated, seem to possess a specific virtue against the disease. It is therefore possible to isolate a fractional portion of lepers in whom the prognosis is by no means hopeless, and it ought to be possible to get hold of incipient cases in the relatively young and subject them to early treatment. The problem then bears a resemblance to that of tuberculosis, where the same possibility obtains. The other fraction of lepers will continue to inhabit the leproseries and with time this fraction should become progressively less in numbers and possibly finally be wiped out. A system of parole prevails among the cured lepers in some localities, and the number that return for treatment gives an inkling as to the success of the latter; thus, of the paroled lepers in the Hawaiian Islands under charge of the United

States government, only 8 per cent return for further treatment.

**LE ROY, EDOUARD** (1870- ). A French philosopher, born at Paris. His family were devout Catholics, and the future thinker grew up with a strong mystical vein in his intellectual constitution. He was admitted to the Ecole Normale Supérieure in 1892, and devoted himself first to mathematics and then to philosophy. He received his doctorate in the mathematical sciences in 1898. After serving as professor of mathematics in various lycées, he was called to take Bergson's place in the Collège de France in 1914. In 1919, he was elected to the Academy of Moral and Political Sciences, and in 1921 was formally appointed to the chair of philosophy at the Collège de France. In 1923, he was visiting professor at Columbia University, New York. In his general philosophy, Le Roy, like Bergson, opposed the stereotyped formal intellectualism, which was fashionable at the end of the nineteenth century. He held that there was no essential distinction between the mathematical and physical sciences, that both dealt with facts recognized and organized by the spirit. He also held that there was no essential distinction between scientific rationalism and the religious aspiration for salvation and perfection. He was preparing (1923) three works on these lines; the first dealing with the mathematical sciences, the second with the empirical sciences, and the third with the idealistic aspirations of philosophy.

In addition to studies published in the *Revue de Métaphysique* and in the *Annales de Philosophie Chrétienne*, Le Roy published in 1911 an exposition of the Bergsonian method in philosophy, *Une Philosophie Nouvelle: Henri Bergson*.

**LEUSCHNER, ARMIN OTTO** (1868- ). An American astronomer, born at Detroit, Mich. He was graduated at the gymnasium at Cassel, Germany, and in 1888 from Michigan, and received his Ph.D. from the University of Berlin (1907). He was an instructor of mathematics at the University of California, where in 1907 he became professor of astronomy and in 1913 dean of its graduate school. During the War he was connected with the Chemical Warfare Service with the rank of major and was also associated with the division of physical sciences of the National Research Council. Dr. Leuschner gave much attention to the perturbations of the Watson asteroids and for his studies on this subject he received in 1915 the Watson medal of the National Academy of Sciences. He also made valuable improvements in the methods of determining preliminary orbits of comets and planets, and published various papers on theoretical astronomy.

**LEVERMORE, CHARLES HERBERT** (1856- ). An American educator and peace advocate, born at Mansfield, Conn. He was graduated from Yale in 1879, and after serving as teacher in history in several schools, he became professor of history at the Massachusetts Institute of Technology in 1888, serving until 1893. From 1896 to 1912, he was president of Adelphi College, Brooklyn, and from 1913 to 1917, director of the College and University Bureau of the World Peace Foundation. He was a member and official in many other peace organizations and lectured much on subjects relating to peace. In 1924, he was awarded the

Bok Peace Prize of \$100,000 for the best plan for insuring peace among the nations. He is the author of *The Academy Song Book* (1895); *Students' Hymnal* (1911); *American Song Book* (1917).

**LÉVI, SYLVAIN** (1863- ). A French Orientalist (see VOL. XIV). He is a highly esteemed contributor to periodicals devoted to Orientalism and the author of a number of books, among them: *Literary History of Buddhism*, with Winternitz and Huber (1920); a translation with introduction of *La Légende de Nal et Damajanti* (1920); *Contes et Légendes du Bouddhisme Chinois* (1921).

**LEVINTHAL, BERNARD LOUIS** (1866- ). An American rabbi, born at Vilna, Russia. He was educated in the schools of Russia and came to the United States in 1891. In the same year, he was minister of the United Orthodox Hebrew Congregations of Philadelphia, and was the founder and president of the Orthodox Rabbinical Association of America. He was a member of the delegation of the American Jewish Congress to the Peace Conference in Paris in 1919.

**LEVITZKI, MISCHA** (1898- ). A Russian pianist, born at Kremenchug. Having begun his musical studies under A. Michailovskii in Warsaw, he continued under S. Stojovski at the Institute of Musical Art in New York (1907-11). The next four years he studied, at irregular intervals, with E. Dohnányi at the Königliche Hochschule in Berlin, winning the coveted Mendelssohn prize. Although he had played in public as an infant prodigy, his career as a full-fledged pianist dates from his début at Antwerp (1912). He then made tours of Belgium, Germany, Austria, Hungary, and Scandinavia. His American début took place in New York (Oct. 17, 1916). In 1921, he made a tour of Australia. He is recognized as one of the masters of the keyboard.

**LÉVY-BRUHL, LUCIEN** (1857- ). One of the leading French philosophers of the sociological school. He was born in Paris and was educated at the Ecole Normale Supérieure. In 1899, he was called to the faculty of the Sorbonne, and in 1918 he was elected to the Institute (*Académie des Sciences Morales et Politiques*). Originally attracted in the direction of idealistic metaphysics, Professor Lévy-Bruhl swung over to the sociological and objective study of the moral sciences. The publication of his book *La Morale et la Science des Mœurs* (1903) created a philosophic furor, owing to the boldness with which he attacked all attempts to rest ethics on metaphysics. He pleaded for the recognition of the relativity of moral laws and customs to the structure of societies. In pursuit of the sociological programme, M. Lévy-Bruhl undertook an interpretation of the mental life of primitive peoples, and published two important works on that subject, *Les Fonctions Mentales dans les Sociétés Inférieures* (1910) and *La Mentalité Primitive* (1922. Eng. trans., 1923). His other works are: *L'Idée de Responsabilité* (1883); *L'Allemagne depuis Leibnitz* (1890); *La Philosophie de Jacobi* (1894); *Lettres Inédites de John Stuart Mill à Auguste Comte* (1899); *History of Modern Philosophy in France* (1899).

**LEWIS, CLARENCE IRVING** (1883- ). An American logician. He was born in California and was educated at Harvard University. Aft-

er teaching at the University of California, he was called to Harvard in 1920. He is the author of a comprehensive *Survey of Symbolic Logic* (1918).

**LEWIS, GILBERT NEWTON** (1875- ). An American chemist, born at Weymouth, Mass. He was graduated from Harvard University and studied at Leipzig and Göttingen. He taught chemistry at Phillips Academy and was instructor at Harvard during 1899-1900 and 1901-06, being on leave during 1904-05 to take charge of weights and measures at the government laboratories in the Philippines. In 1907, he became connected with the physical chemistry research work of the Massachusetts Institute of Technology, where in 1911 he was made professor. In 1912 he became professor of chemistry and dean of the School of Chemistry at the University of California. During the War Professor Lewis was chief of the defense division of the gas service with the rank of lieutenant-colonel, and chief of the training division of the Chemical Warfare Service. He published papers resulting from his studies on the thermodynamic theory and its application to chemistry, electric potentials of the common elements, specific heat of electrons, the structure of the atom and the molecule and the theory of valence. The French government conferred on him the Legion of Honor.

**LEWIS, ISAAC NEWTON** (1858- ). An American soldier and inventor, born at New Salem, Pa. He was graduated from the United States Military Academy in 1884 and was commissioned second lieutenant in the Second Artillery. By successive promotions he rose to the rank of colonel in 1913, and was retired in that year for disability incurred in line of duty. He early made himself an authority on ordnance and was sent to Europe in 1900 to study that subject, his report resulting in the re-armament of the field artillery. The machine gun bearing his name was invented by him and after its rejection by the United States was accepted by the British government. During the War it was used by the Allied armies, by the United States Navy, and the airplanes of the United States and Allies. The royalties, amounting to at least \$1,000,000 on guns made for the United States after it entered the War, were declined by him. His other inventions have included a time-interval clock and bell system of signals, a replotting and relocating system for coast batteries, an automatic sight, quick-reading mechanical verniers for use in coast defenses, electric car lighting, and windmill electric lighting systems.

**LEWIS, JAMES HAMILTON** (1866- ). An American legislator (see VOL. XIV). He served as United States Senator from Illinois from 1913 to 1919, as Democrat. He was candidate for governor of Illinois in 1920 but was defeated. In 1914, he served as United States Commissioner representing the United States Senate at London to execute treaty laws for safety at sea. He wrote *The Two Great Republics: Rome and the United States* (1913), and *History of International Law*. In 1918, he was engaged in special war work in France.

**LEWIS, SINCLAIR** (1885- ). An American author born at Sauk Center, Minn. He received his bachelor's degree from Yale University in 1907 and worked on newspapers in New Haven, San Francisco and other cities. He was successively assistant editor of the *Trans-*

*atlantic Tales*, *Volta Review*, *Adventure*, Publishers' Newspaper Syndicate, and editor with the Geo. H. Doran Co. to 1916. He became universally known in 1920 through his novel *Main Street*, which for the first time in the history of the novel in the United States treated with utter seriousness and perspicuity life in a small town in the Middle West. This was the manifesto for a new school of Western writers which had been growing since shortly before the War, and the Middle West assumed a dignified and assured place in the literature of this country. His *Babbitt* (1922) treats of the development of a man's bourgeois soul in the Middle West, his one attempt at revolt, and his subsequent return to the respectable fold. Other novels are: *Our Mr. Wren* (1914); *The Trail of the Hawk* (1915); *The Job* (1917); *The Innocents* (1917); *Free Air* (1919); *Dr. Arrow-smith* (1924). He also wrote a play, *Hobohemia*, which was produced in New York City in 1919, and has contributed short stories to the *Century*, *Saturday Evening Post*, and other magazines.

**LEWIS, SIR THOMAS** (?- ). A British physician and leading authority on heart disease. Born in Cardiff, Wales, he was educated in the local university, and received the degree of M.B. in 1905 from the University of London. He subsequently lectured on cardiac pathology in his Alma Mater and when the periodical *Heart* was established became its editor. He was knighted in 1921. Lewis has written much on the heart, his major publications comprising *The Mechanism of the Heart Beat* (1911); *Clinical Disorders of the Heart Beat* (1912); *Clinical Electrocardiography* (1913); *Lectures on the Heart* (1915); *The Soldier's Heart and the Effort Syndrome* (1919); *The Mechanism and Graphic Representation of the Heart Beat* (1921).

**LEWIS, WARREN KENDALL** (1882- ). An American chemist, born at Laurel, Del. He was graduated in 1905 from the Massachusetts Institute of Technology, and in 1908 received his Ph.D. at Breslau. In 1908, he became a research associate in the laboratory of applied chemistry at the Massachusetts Institute of Technology, where in 1910 he became professor of chemical engineering. During the War, he was an assistant in charge of defense problems of the research division of the Chemical Warfare Service. Dr. Lewis contributed articles on chemical technology to Thorp's *Outlines of Industrial Chemistry* and also to various scientific journals.

**LEWISOHN, LUDWIG** (1882- ). An American author born in Berlin. He came to the United States with his parents in 1890, and received his education in the public schools and at Columbia University. He taught German in the University of Wisconsin (1910-11) and at Ohio State University (1911-19). During his teaching years he devoted much time to writing and in 1919 was dramatic editor for the *Nation*, in 1920, becoming associate editor of that magazine. He made several translations from the German, chief among which are the dramatic works of Gerhart Hauptmann (1912-17). His best known book is *Upstream* (1922), an autobiography in which is set forth a searching criticism of the intellectual and artistic life of this country. His novel, *Don Juan*, which appeared in 1923, deals with the problem of divorce. Others of his works are: *An Introduc-*

tion to the Study of German (1910); *The Modern Drama* (1915); *The Spirit of Modern German Literature* (1916); *Poets of Modern France* (1918); *The Drama and the Stage* (1922); *The Creative Life* (1924).

**LEXER, ERICH** (1867- ). A German surgeon, known especially for his efforts in transplanting joint surfaces and other plastic work of the same kind. Born in Würzburg, he received his medical degree from the university of that city in 1890 and was made professor of surgery at the University of Jena in 1910. His first work on surgery was his *Lehrbuch der Allgemeinen Chirurgie* (2 vols., 1904-05, republished, 1914). At a later period, with Garré and Küttner, he brought out the *Handbuch der Praktische Chirurgie*, which was reissued in six volumes, 1921-23. He also summed up his war and post-war experiences in his *Wiederherstellungschirurgie* (1920).

**LEYEN, FRIEDRICH VON DER** (1873- ). A German writer and professor of Old German philology at the University of Cologne. He was born at Bremen and studied at Marburg, Leipzig, and Berlin. Included among many works he published are: *Des Armen Hartmann Rede vom Glauben* (1897); *Indische Märchen* (1898); *Das Märchen in der Göttersage der Edda* (1899); *Götter und Göttersagen der Germanen* (1909); *Das Märchen* (1911); *Die Deutschen Heldensagen* (1912); *Das Studium der Deutschen Philologie* (1913); *Deutsche Volkskunde und Deutscher Unterricht* (1915); *Eindrücke aus Amerika* (1915); *Aufgaben der Goethe-Gesellschaft* (1916); *Das Deutsche Märchen* (1917); *Die Deutsche Dichtung* (1918). He also edited works of Herder, Schlegel, Wackenroder, Hertz and others.

**LIBERIA.** A Negro republic on the west coast of Africa. Area variously estimated at 40,000 square miles. The population was estimated at 1,500,000, of whom American Liberians numbered 12,000; the capital, Monrovia, had 6000. In 1922, the enrollment in all the Liberian schools was placed at only 9000. Agricultural methods were still primitive and the country's economic resources, e.g. minerals, ivory, hardwoods, had hardly been tapped. Leading products included cocoa, cotton, coffee, piassaba fibre, palm oil, and kernels. Imports were rice, gin, tobacco, cotton piece goods, building materials. Trade was mainly with the United Kingdom, Liberian exports in 1913, 1920, and 1923 being £56,709, £537,362, and £57,311, and imports for the same years, £90,258, £271,992, and £115,581. Trade with the United States in 1913 and 1923 was: imports, \$96,900 and \$175,032; exports, \$2319 and \$17,790. In 1912-13, revenues were \$618,800 and expenditures \$529,548. In 1917-18, these had dropped to \$273,000 and \$255,700. For 1921, revenues totaled £90,395 and expenditures £107,109. In 1918, customs duties brought in \$162,120; in 1920, \$314,690; in 1921, \$197,139. In 1918, the total debt was \$2,131,700 made up of: \$1,608,000 refunding loan of 1912; \$423,128 internal floating loan; \$84,603 due the Bank of British West Africa; \$15,969 owed by the post office. The customs office was administered by an official appointed by the United States. The police force, maintained for the security of the revenue, cost \$72,000 in 1918. The only means of inland communication was a motor road 20 miles long. There were no railways or telegraphs. There were two wireless stations at

Monrovia and cable lines from there to Europe and New York.

The entry of the United States into the War paved the way for Liberian participation. In August, 1917, Liberia declared war on Germany and seized the opportunity to eject the Germans, who up to that time had controlled more than 75 per cent of Liberia's trade. In 1918, a German submarine, in retaliation for the seizure of German property, shelled Monrovia and sank the single vessel which constituted the country's navy. Beginning with 1920, the United States began to occupy the leading role in Liberia's affairs. The direct occasion for this move was the fact that, in 1918, the United States had placed to the credit of Liberia for war expenditures the sum of \$5,000,000. Only \$26,000 was used before the War terminated with the result that a proposal was made that the whole be carried as a government loan to Liberia. Difficulties in closing the terms brought a Liberian mission to the United States. The United States, in order to advance the economic development of the country and at the same time to secure the proposed loan, sought to gain control over the administration of customs, posts, commerce, road building, etc. In spite of President Harding's approval, the loan failed of passage in the Senate (September, 1922), as a result of the attack made on it by Senator Borah who charged that undue influence was being exerted by American financial interests that held worthless Liberian securities. The rejection of the loan seemed to please many Liberians and the Liberian government declined to accept the same amount from private sources upon the conditions demanded by the American government. However, it was evident that the failure of the loan left Liberian finances in a very precarious position, and endangered the security of the funds advanced in 1912. In 1923, Liberia was on the verge of bankruptcy. Government salaries had not been paid; the administration was borrowing from British banks in hand-to-mouth fashion; English and German interests had gained control of shipping, and France of the cables and wireless. The president for 1916-20 was Daniel E. Howard; for 1920-24, C. D. B. King.

**LIBERTY LOANS.** See UNITED STATES, History.

**LIBERTY TUNNEL, PITTSBURGH.** See TUNNELS.

**LIBRARY ASSOCIATION, AMERICAN.** During the War the Association organized and administered library service for the army, navy, and marine corps at the request of the United States government, mobilizing several hundred libraries for the work. Five million dollars and several million books and magazines were collected. Fully equipped libraries were maintained in the principal camps and stations, with small branches in recreation buildings. Collections of books and magazines were sent to small camps and posts, to naval ships and army transports. A reasonably adequate service was rendered to troops overseas, with special emphasis in 1919 on the educational work. Hospital library service became an important feature in 1919-20. At the end of the War, the Army and Navy Departments took over the service, and later, the Veterans' Bureau took over the highly organized library service for men in hospitals.

In 1919-20, the Association prepared a great

extension programme, but the financial campaign was not fully organized and resulted in donations of less than \$100,000 for the new work. Some increase in the Association's extension service was made possible, however, and the publicity for the campaign greatly stimulated general interest in the development of libraries. In 1924, a commission was appointed to investigate the need and the demand for adult education, the work of agencies now offering this, and especially the work of libraries in this field; to formulate recommendations concerning new methods for increasing the library's usefulness, and new schemes to enable libraries and schools to teach the habits of reading and study more successfully.

The council at its meeting on June 30, 1924, created a permanent Board of Education for Librarianship, the first important effort to standardize education for the library profession. The Committee of Five on Library Service had completed the preliminary work of its survey of library practice and methods.

The cost of a union list of the holdings of periodical files in American libraries was covered by advance subscriptions from libraries and by a gift from the Laura Spellman Rockefeller Memorial. A gift of \$50,000 from the American Committee for Devastated France made possible the establishment and operation for two years of a library school in Paris, offering summer and winter courses in American library practice, adapted to French needs. Gifts were received by the Association from the Laura Spellman Rockefeller Memorial in 1923 and 1924 for the purchase of American books for libraries in European countries whose depreciated currency made impossible the purchase by them of American publications, and books and periodicals were being supplied, in response to requests, to Germany, Austria, Hungary, and Poland; while American libraries contributed from their duplicate collections several thousand volumes for the American Library in Paris and other European libraries, and for libraries destroyed by the earthquake in Japan. Beginning in 1922, the Children's Librarians' Section made an award annually for the most distinguished book for children published in America during the year, the award being made possible by a gift from Frederic Melcher of New York. Other important gifts received during the latter years were: from the Carnegie Corporation of New York, \$164,100 for various studies, publications and current activities; and from the Carnegie Endowment for International Peace, \$5000 for American books on public law, including international law, for European libraries.

The Association published many books and pamphlets on library work, not for profit but in the interest of library development. There were also several reading courses, reading lists, publicity leaflets, posters and other minor publications, and a series of textbooks for use in library training agencies and a new series of reading courses for adults was begun. *The Booklist*, the librarian's guide to new books, was issued monthly, except in July and August.

Annual conferences were held in different parts of the country, the largest in 1921 at Swampscott, Mass., with an attendance of about 1900. The membership of the Association increased from 2505 in 1914 to more than 6000 in 1924.

**LIBRARY PROGRESS.** The decade 1914-24 was noteworthy in American library affairs. The library war service of the American Library Association (q.v.) gave wide publicity and new impetus to the library movement. Few cities and large towns were without libraries in 1924. Many counties had established and were maintaining library service for rural as well as urban populations. Most universities and colleges had organized libraries. Nearly every high school had a library of some sort, and some of them were well organized for effective service. Perhaps the most important features of library progress during the 10 years were (a) the great increase in the number of libraries and of library buildings, and (b) the development of new types of library service.

Grants of nearly \$11,000,000 were made for library buildings from 1914 to 1922 by the Carnegie Corporation of New York, most of it for the erection of comparatively small buildings. Many small buildings were erected from other private donations and from public funds. Several large buildings had been or were being erected from public (or in a few cases private) funds, notably the central public libraries in Philadelphia, Brooklyn, Detroit, Cleveland, Richmond, Savannah, Indianapolis, Providence, Wilmington (Del.), St. Paul, Houston, Sacramento, San Francisco, Los Angeles, and Montreal; and libraries at a good number of colleges and universities. The Henry E. Huntington Library was erected in Pasadena, and the great Morgan Library opened to the public in New York City. The Carnegie Corporation discontinued the giving of money for library buildings during the latter years "in the belief that so many of these have been provided, and so many communities have received the impulse for library facilities, that the purpose which Mr. Carnegie had in view has been in large measure accomplished."

In the latter few years there was growing up a new respect and a greater demand for adult education, and libraries were finding in this new interest an opportunity to increase the service they had always rendered and to develop new types of service. The Chicago Public Library in 1923 created a Reader's Service Bureau whose function was to increase the usefulness of the library to men and women who wish to continue their education out of school. This Bureau aimed to prepare outlines for the study of any nonvocational subject for patrons interested in following a definite course of reading, while the library undertook to supply the books prescribed in sufficient quantity to meet promptly all reasonable demands. Many other libraries had readers' assistants rendering similar service to the serious individual student. The Milwaukee Public Library made a survey of all adult education classes in the city and was attempting to make the library serve these classes. The Cleveland Public Library was attempting to make appropriate connections between the library and the adult student. The Indianapolis Public Library organized a new department to give special attention to the educational needs of young men and women and older boys and girls out of school. Adult education was the main theme of the American Library Association conference in 1924.

During the later years several States passed laws and issued regulations requiring the maintenance of adequate libraries in schools

and the teaching of the use of books and libraries as a part of the curriculum. In a few States accredited high schools were required to employ trained librarians after a fixed date. The county library was coming to be accepted as the best form of library service for reaching rural as well as urban residents, except in those few eastern States where the county is an unimportant unit of government. In 1924, more than half the States had laws permitting counties to establish libraries and to levy taxes or make appropriations for their support. The actual establishment of county libraries, however, was moving slowly. California led in the movement. After the War there was a fairly general recognition of the therapeutic value of books in hospitals. The War and Navy Departments, the Public Health Service, and the Veterans' Bureau had come to recognize the necessity, not only of reading matter, but of skilled library service in hospitals. Many public libraries were organizing library service for the private and public hospitals in their communities. Gradual progress was also being made in the development of library service for men in penal and correctional institutions. Special libraries in business houses, industrial plants, banks, bond houses, insurance offices, etc., were increasing in number from year to year in spite of the set-back during the depression of 1920-21. The library service for the merchant marine, originally a feature of the Library War Service of the American Library Association, was taken over in 1921 by the American Merchant Marine Library Association, 82 Beaver St., New York, N. Y., organized for that purpose.

Other important developments in the latter few years were: Greater emphasis on library publicity; increased attention to education for library work; a growing recognition of the importance of special training for scholarly bibliographical work (as indicated by the establishment of a chair of bibliography at Yale); and more international library interests. It was estimated that there were between 8000 and 10,000 public, college, school and special libraries in the United States, and between 20,000 and 25,000 library workers. An excellent book on the subject is Bostwick, *The American Public Library*, published by Appleton.

**LIBYA.** An Italian colony on the north coast of Africa, between Tunis and Egypt. It consists of the two provinces of Tripolitania and Cyrenaica. Its area is estimated at 406,000 square miles; its native population (census of Dec. 1, 1921) was 569,093. The total estimated population was put at 1,000,000 divided racially into 30 per cent Arabs, 40 per cent Negroes, 23 per cent Jews, 7 per cent Europeans. The civil European population in 1921 numbered 28,364, made up mostly of Italians and Maltese. Tripoli, the capital of Tripolitania, had 73,000 inhabitants; Benghazi, capital of Cyrenaica, 35,000. The country is largely desert, but in the coastal region and in the highlands, agricultural and pastoral activities are carried on. Barley was chiefly grown, but henna and dates were also cultivated. Other articles of trade consisted of sponges, tunny fish, ostrich feathers, potatoes, matting, fats, honey, and hides of camels, oxen, sheep, and goats. For want of irrigation, agriculture was necessarily restricted. The caravan trade into the Sudan, formerly very important, was being diminished because of the

French occupation of Timbuktu and the presence of the Kano-Lagos railway in British Nigeria. Principal exports into Sudan were cotton and woolen goods, blankets, rugs, tea, coffee, sugar, paper. Imports from the Sudan were ivory, ostrich feathers, hides and skins, leather objects. Imports by sea into the colony included wines and liquors, oils, sweetmeats, chemical products, cotton, woolen, and silk yarn, iron and steel manufactures, tobacco and matches. Total exports in 1912 for both provinces were \$777,597 (a lira converted at \$0.193); for 1921, they were \$1,476,300 (lira converted at \$0.04). Total imports for 1912 were \$5,361,926; for 1921, \$7,192,700. In 1914, the budget balanced at \$13,795,100; for 1922-23, the budget estimate for expenditures was \$12,477,950 (lira converted at \$0.048). In the latter year the state contribution toward revenues was \$9,738,144. The Italian government maintained 13,000 men in Tripolitania and 9600 men in Cyrenaica for defense purposes. There were in all 163 miles of railway in operation to supplement the principal means of communication, i.e. caravan routes. By the Treaty of Lausanne (Oct. 18, 1912) the Turkish evacuation of Libya paved the way for Italian occupation. The pacification of Tripolitania proceeded without difficulty so that by 1915 the coastal region was well under Italian control. In Cyrenaica, however, great difficulties were encountered. The Senussi continued in possession of the interior and stubbornly contested the scheme of Italianization. Fighting went on during 1914 and 1915 and so successful were the insurgents that the inland garrisons had all to be abandoned and Italy was once more reduced to her coastal possessions. In 1916, with Turkish aid, the Senussi brought the fighting into the coastal region, and but for the failure to unite all the insurgent forces, almost succeeded in expelling the Italians entirely. The end of the War found the local chieftains unable to effect a common understanding among themselves. To gain over the local tribes the Italians, after the War, deemed it necessary to grant autonomy. A parliament was set up, and as a result of peace being established with the Senussi in November, 1920, the Italians were able to resume once more their penetration with only occasional molestation. By arrangement with France in 1919, the western frontier of Tripoli was laid out to extend in a curve from west of Ghadames to south of Tumbo. Similarly, as a result of an understanding with Great Britain, Jarabaib, on the Egyptian frontier, was ceded to Italy.

**LICHNOWSKY, KARL MAX, PRINCE** (1860- ). A German diplomat. He served in important capacities in several embassies, and at the outbreak of the War was German Ambassador in London. He endeavored, by every means in his power, to prevent the outbreak of war, and on its outbreak, left London and went into retirement. Here he wrote an account of his "mission to London," which was privately circulated. Extracts appeared in a Swedish newspaper, in March, 1918, and shortly afterwards were published in book form. In this he brought serious charges against Germany. The book made a great sensation and provoked the consternation of Germany. Although Ludendorff urged that proceedings be taken against Lichnowsky, nothing was done.

**LIEBKNECHT, KARL** (1871-1919). A

prominent German Socialist (see VOL. XIII). Called to the army in 1915, he served on the western front, which brought upon him violent censure from his party. Attacking the militarism of the government in open session of the Diet in 1916, he was expelled and soon after convicted of high treason for participation in a Socialist May Day celebration. He was sentenced to four years of penal servitude and loss of civil rights, but was released in October, 1918. Engaging at once in revolutionary activities, he was killed by the Nationalists in the Berlin revolt of Jan. 16, 1919. Among his later works are: *Gegen den Bürgerlichen Militarismus* (1920); *Politische Aufsätze aus Seinem Nachlasse* (1921); *Reden und Aufsätze* (1921); *Studien über die Bewegungsgesetze der Gesellschaftlichen Entwicklung* (1922). See GERMAN, *History*.

**LIECHTENSTEIN.** One of the smallest independent European states lying between the Austrian province of Vorarlberg and the Swiss cantons of St. Gallen and Graubünden. Its area is 61.4 square miles; its population (1912), 10,716. The budget for 1922 balanced at 384,500 francs. In October, 1921, a new constitution providing for a diet of 15 members, elected by direct vote on the basis of universal suffrage and proportional representation, was adopted. In 1921, the principality, heretofore the ward of Austria, joined the Swiss Customs Union and turned the administration of its posts and telegraphs over to Switzerland.

**LIENHARD, FRIEDRICH** (1865- ). A German poet and novelist (see VOL. XIV). He published after 1914: *Der Einsiedler und Sein Volk* (1914), a volume of short stories; *Lebensfrucht*, his collected verse (1915); *Jugendjahre*, recollections of his youth (1918); *Westmark*, a novel (1919); *Der Meister der Menschheit* (1919); *Wer Zuletzt Lacht* (1921); *Aus Taulers Tagen* (1924). He edited *Der Türmer*, a magazine published in Weimar.

**LIGGETT, HUNTER** (1857- ). An American army officer, born at Reading, Pa. He was graduated at the United States Military Academy in 1879 and was made a second lieutenant in the 5th Infantry. By successive promotions he reached the rank of major-general in 1917 and was retired in 1921. He served in campaigns against the Indians and during the war with Spain was in Cuba, with the rank of major of volunteers. Later he was in the Philippines, and subsequent to his return to the United States, after various duties, he was sent to the Army War College, where he was graduated in 1910 and of which he was president in 1913. In 1914, he served on the Mexican border and in 1917 commanded the Department of the Philippines. During the War he was in France as commander of the 41st Division (1917-18) and then with the 1st Army Corps (1918-19) with the rank of lieutenant-general. Later he was on the Rhine in command of the 3d Army (1919). He took part in the second battle of the Marne and participated in the engagement at St. Mihiel and in the Meuse-Argonne campaign. On his return to the United States he was assigned to the command of the Western Department with San Francisco as his headquarters. For his services in the War he received the Distinguished Service Medal of the United States, the decorations of the Legion of Honor from France, the Order of Leopold from Belgium, and the

Order of St. Maurice and St. Lazarus from Italy. **LIGET.** See PHYSICS.

**LIGHT, MEASUREMENT OF.** See ELECTRIC LIGHTING.

**LIGHTHOUSES, AND OTHER AIDS TO NAVIGATION.** It was quite natural that but little attention should be paid to lighthouses and other aids to navigation during the War, although in the United States progress in installation and development was fairly steady except during the period of the country's actual engagement in hostilities and its readjustment to peace conditions. With the restoration of normal conditions came important developments in most of the countries of the world, rather in the provision of improved illuminants and signalling devices, in increasing the number of such marks as gas buoys, and particularly in installing radio apparatus for signals and for communications. In the construction of notable light towers or other structures not much of importance was done between 1914 and 1924, but the improvement of equipment in the interest of better navigation as well as general efficiency and economy was significant. Thus the improvement of lights on rivers and bays was marked and the placing of acetylene buoys to mark the Ambrose Channel of the New York harbor in 1920 was a distinct advance. On the Mississippi and Hudson Rivers also there has been a marked improvement in the lights. With the extensive development of aeronautics, lighthouse authorities were giving consideration to the utilization of coast lighthouses in aerial navigation, but little had been done in determining modifications needed for existing equipment. For the American Transcontinental Mail route an elaborate system of illumination and light marks had been devised. See AERONAUTICS.

**Automatic Lighting.** In the period following the War automatic lighting was a leading consideration for the lighthouse services of the various countries of the World. It was extensively introduced, even at the more important stations, although in the latter instances one keeper usually was retained, and the installation was quite costly. Such lights for the most part employed dissolved acetylene, and for the higher illuminating power there was a lens revolved by the gas pressure, while the flame was produced by the combustion of a mixture of acetylene and air under an incandescent mantle, with automatic mantle exchanger. European automatic lights and light sectors were in many cases more complicated than those employed in the United States. Automatic lighting by incandescent electric lamps had been extensively developed in some countries for unwatched or semiwatched stations, even those of primary importance. Here were often employed large light bulbs approximating 1 foot in diameter, with spirally wound filaments in gas-filled bulbs. The large current required was supplied from commercial sources or by automatic power units at the station. In some of the apparatus, particularly that for the coast of Holland, where this system was extensively introduced, the electric light had a reserve gas light which was automatically swung into focus or set in operation in another lens on the failure of the electric light.

The United States Lighthouse Service in 1923 had in commission more automatic apparatus than similar services in any other country in the world. Of 4047 coast and lake

lights, 1665, or 41 per cent, were automatic, doing the work of 765 lighthouse keepers and assistants. In addition, 668 lighted buoys, which could not be maintained by human attendance and which were invaluable aids to mariners, were automatically operated and aided night navigation on many important rivers and channels. This tendency to provide automatic installations is indicated by the fact that during the fiscal year 1923, 30 stations were put on an automatic basis, with an annual saving of 76 per cent of the cost of the changes. Thus, in addition to many automatic gas buoys, new automatic lighthouses were installed at important points, as at Molasses Reef and Pacific Reef, two important unlighted stretches of the Florida Reefs.

**Fog Signals.** A most important development in the way of improving coastwise navigation was fog signals which by the use of radio were to send out from transmitting stations signals appropriate to the locality. These could be detected on vessels equipped with ordinary receiving apparatus. The first radio fog signals in the United States were placed May 1, 1921, on the Ambrose Channel Light vessels at the entrance to the New York harbor, on the Fire Island light vessel, and on the Sea Girt (N. J.) lighthouse, all in the vicinity of New York harbor. Eight radio fog signals were in operation in 1923, one at Cape Henry, Va., one on the Diamond Shoals lightship in North Carolina, and one on the Blunts Reef lightship off Cape Mendocino, Cal. Five additional radio fog signals were later installed in lightships at Boston, Mass.; Five Fathom Bank, Del.; Swiftsure Bank, Wash.; in the Columbia River; and off the Straits of Fuca. These instruments furnished, with proper precautions, bearings approaching the accuracy of visual bearings, and were available at greater distances. See RADIO TELEGRAPH.

In 1924 a power tube radio fog signal transmitter was placed in commission on Ambrose Channel lightship. This was the first tube transmitter used in the United States for fog signal purposes. This transmitter was installed by the United States Lighthouse Service after extensive tests indicating freedom from directional distortion, lessened interference, and increased efficiency. While the radio fog signal stations in the United States had used spark transmitters, it was found that tube transmitters would provide a signal which could be tuned more sharply to the wave length prescribed for radio fog signals. Comparative tests of the tube and spark transmitter indicated that the former would give signals equally effective with at least one-third less power than the spark transmitter. Installations of radio fog signals had been provided in France, Spain, Norway, Scotland, England, and Holland, though less extensively than in the United States. It was universally recognized that instruments for determining the radio bearing should be located on shipboard, and some 100 European craft were equipped in 1923 with radio direction finders. Aside from the use of radio, the principal advance noted in fog signals was the further introduction of automatic apparatus for minor signals, such as bells, along the lines described or of similar nature. Explosive signals were used to some extent, but the advantage of small installation cost was offset by the continuous manual attention required.

**United States Lighthouse Service.** On June 30, 1923, there were maintained by the United States Lighthouse Service, which is by far the largest lighthouse organization in the world, 16,888 aids to navigation, including 5942 lights of all classes and 596 fog signals (not including 153 buoys with whistles and 397 buoys with bells), of which 7 were radio signals, 6 were bells operated automatically by gas, and 46 were submarine signals. The accompanying table gives a summary of the aids to navigation under each class in commission at the end of the fiscal years 1914 and 1923.

| Class                                                 | June 30, 1914 | Total, June 30, 1923 |
|-------------------------------------------------------|---------------|----------------------|
| <b>Lighted aids:</b>                                  |               |                      |
| Lights (other than minor).....                        | 1,588         | 1,915                |
| Light vessel stations.....                            | 52            | 47                   |
| Gas buoys.....                                        | 453           | 430                  |
| Gas buoys, with whistles and bells <sup>a</sup> ..... |               | 233                  |
| Minor lights.....                                     | 2,793         | 3,147                |
| Float lights.....                                     | 118           | 170                  |
| Total lighted aids.....                               | 5,004         | 5,942                |
| <b>Fog signals:</b>                                   |               |                      |
| Radio.....                                            |               | 7                    |
| Sound fog signals (air).....                          | 519           | 543                  |
| Submarine fog signals.....                            | 48            | 46                   |
| Gas buoys, with whistles and bells <sup>a</sup> ..... |               | 233                  |
| Whistling buoys, unlighted.....                       | 86            | 76                   |
| Bell buoys, unlighted.....                            | 233           | 241                  |
| Total fog signals.....                                | 886           | 1,146                |
| <b>Unlighted aids:</b>                                |               |                      |
| Buoys.....                                            | 6,330         | 7,276                |
| Day beacons.....                                      | 1,978         | 2,757                |
| Total.....                                            | 8,308         | 10,033               |
| Grand total.....                                      | 14,198        | 16,888               |

<sup>a</sup> Gas buoys with whistles and bells are counted only once in the grand total.

In the period between 1910 and 1920 there was a net increase of 4611 in the total number of aids to navigation in the United States. The number of gas buoys increased two and one-half times and the number of lighthouses, equipped with brilliant oil vapor lights, increased four times. The number of automatic gas lights ashore increased nearly seven times, effecting an important economy in the cost of attendance. In 1924 radio equipment had been placed on more than half of the tenders and telephone communications between shore stations. Acetylene buoys were in standard use and were placed at important channels.

In Alaska during the period from 1914 to 1924, many new aids to navigation were established, so that on June 30, 1923, there had been provided a total of 650 aids to navigation in this Territory. This was a steady growth from 1910, when there were but 160 such aids. In 1923 there were 227 lights, 14 gas buoys, 11 fog signals, 271 buoys and 127 day marks. The United States Lighthouse Service had been active in the other Territories and outlying districts, where increased commerce rendered additional aids to navigation essential. Thus in 1921 there was built a new light station and buildings at Point Borinquen, at the northwestern extremity of Porto Rico, at a location where the necessity of a landfall light was emphasized by the opening of the Panama Canal and its increasing use. This new light was placed on a reinforced concrete structure of cylindrical form located 233 feet above sea level. It was simple in design and heavy and strong enough to resist earthquake shocks. It was built on a concrete foundation 25 feet square by six feet deep, and the main tower was 15 feet in diameter with walls 15 inches thick

and rising to a height of 46 feet; above it was a service room and a standard helical bar lantern. The illuminating apparatus consisted of a third-order 12-panel flashing lens on a mercury float with a 55 mm. type A incandescent oil vapor lamp. This light shows a group of four white flashes of 32,000 candle power every 30 seconds and is visible 24 miles. At Guam a valuable new light was installed at Hole-in-the-Wall in 1923 by the United States Lighthouse Service. Lights were also maintained at Guantanamo and Samoa. At these last three points the aids to navigation are maintained under the direction of the Naval Commandant by means of allotments from the appropriations for the Lighthouse Service.

**LIGHTNING ARRESTER.** See ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.

**LIGHTSHIPS.** See LIGHTHOUSES.

**LIGNIN.** See CHEMISTRY, ORGANIC.

**LILIENFEIN, HEINRICH** (1879- ). A German dramatist and novelist. He was born at Stuttgart and studied history and philosophy at the universities of Tübingen and Heidelberg. He became general secretary of the *Deutsche Schillerstiftung* at Weimar. Among his later works are: *Der Herrgottswarter* (1906); *Der grosse Tag* (1907); *Der Schwarze Kavalier Olympias* (1908); *Der Stier von Oliveira* (1910); *Die Herzogin von Palliano* (1914); *Hildebrand* (1917); *Die Ueberlebenden* (1920). His principal works of fiction are: *Die Grosse Stille* (1912); *Der Versunkene Stern* (1914); *Im Stillen Garten* (1915); *Ein Spiel im Wind* (1916); *Die Feurige Wolke* (1919). He also wrote *Heinrich Vierodt, das Profil eines Deutschen Dichters* (1915).

**LILLIE, RALPH STAYNER** (1875- ). An American physiologist, born at Toronto, Ont., Canada. He was educated at Toronto University, at the University of Michigan and at the University of Chicago (Ph.D., 1901). He was instructor in physiology and histology (1902-03) and adjunct professor (1903-05) at the University of Nebraska; instructor in physiology at Harvard (1905-06); instructor in physiology and zoölogy (1907-11), and assistant professor (1911-13) at the University of Pennsylvania; professor of biology at Clark University (1913-20); biologist at the Nela Research Laboratory, Cleveland, Ohio (1920-24); and instructor in physiology at Woods Hole, Mass. (1901). He published extensively in scientific journals on osmotic pressure of colloids, physiology of growth processes, and articles on protoplasmic transmission.

**LIMBURG.** Upon the region of South Limburg, in southeastern Holland, centred the chief Belgian demand for territorial compensations. This Dutch province, with an area of 847 square miles and a population (1922) of 459,620, had been given to Holland by the Treaty of 1839, against the protests of the Belgians. At the Versailles Conference, Belgium once more pressed her claims, not on grounds of ethnography, for the people are plainly Dutch, but for historical, strategic, and economic reasons. Limburg had taken part in the Belgian revolution of 1830. It was vitally necessary for the protection of the Belgian frontiers, for it dipped south to touch Belgium on the east and thus controlled the defense of the Meuse. The position of the Meuse in the disputed district was perhaps the most serious of the Belgian grievances, for the Dutch possession of this

waterway, with its important bridgehead at Maestricht, imposed an effective check on the progress of Belgian commerce. Similarly, Limburg seemed vitally necessary to Belgium if the Rhine-Scheldt Canal, which was guaranteed by the Peace of Versailles, was ever to become a reality. Limburg, formerly neglected by the Dutch, became a source of real interest during the War; the lignite mines opened up there were producing 1,425,617 tons in 1918 and some 400,000 tons more in 1919. The Peace Conference, however, refused to countenance the transfer of the territory; the only step it would take was the establishment of an international commission to investigate the matter of the Treaty of 1839. Territorial compensation was thus out of the question. Only after lengthy negotiations was it possible for the two disputants to come to terms on the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine Canal, and two other water-systems; with this, Belgium had to remain content.

**LIME.** In 1922, there were 530 plants in the United States engaged in the production of lime, and these were scattered widely, being distributed throughout nearly every State in the union. The more important districts were in Southern Pennsylvania, the Toledo district of Ohio, and the Shenandoah Valley district of Virginia and West Virginia. The production in 1922 was 3,639,617 short tons, valued at \$33,255,039. About one-half of the lime produced is used in the building trades. In 1922, agriculture used 7.5 per cent of the output, this being a decrease from previous years' consumption in this field, while the remainder was employed in various chemical industries, such as paper mills, glass works, tanneries, metallurgical plants, sugar factories and the manufacture of chemicals and for other purposes, with about 140 different industries in which lime is regarded as essential. Lime is sold either in lump or in ground form and by means of the air separation process a very pure product is obtained and the ease of shipping and handling has been increased so that it is more widely used than ever.

**LIMING.** See FERTILIZERS.

**LIND, SAMUEL COLVILLE** (1879- ). An American physicist, born at McMinnville, Tenn. He was graduated at Washington and Lee University in 1899 and at the Massachusetts Institute of Technology and received his Ph.D. at Leipzig, Germany. He was assistant in chemistry at the Massachusetts Institute of Technology and assistant professor of general and physical chemistry at Michigan (1905-15). Meanwhile he became interested in radioactivity and studied in Paris (1910) and at the Radium Institute in Vienna (1911). In 1913, he was appointed chemist for the United States Bureau of Mines in charge of radioactivity and in 1918, he became director of its rare and precious metals station in Reno, Nev. Dr. Lind published papers on radium extraction and measurement, on the influence of radiation on chemical action, and relation of gaseous ionization to chemical action; he is also the inventor of the Lind interchangeable electroscope for radium measurements.

**LINDSAY, (NICHOLAS) VACHEL** (1879- ). An American poet and artist (see VOL. XIV). In 1910, when he published the *Village Magazine*, he was almost unknown but since then he has been recognized as one of the main hopes

of American poetry. Technically and aesthetically he is full of inaccuracies, but his poetry is strong and vital and many of his poems have the true ballad ring. He is one of the strongest forces in the development of the epic of the West in the United States. He has recited before many school audiences in this country and in England. His chief works are: *Handy Guide for Beggars* (1916); *The Art of the Moving Picture* (1915); and the volumes of poems entitled *General Booth Enters Heaven* (1913); *Congo and Other Poems* (1914); *The Chinese Nightingale and Other Poems* (1917); *The Golden Whales of California and Other Poems* (1920).

**LINDSEY, BEN (JAMIN) B (ARR)** (1869- ). An American jurist and reformer (see VOL. XIV). He was active in the organization of the Progressive party and was a member of its National Committee in 1912. He lectured much throughout the country on children's problems. He was the author of *The Rule of Plutocracy in Colorado*; *The Doughboys' Religion* (1919), and *Pan-Germanism in America* (1919).

**LIPPMANN, WALTER** (1889- ). An American writer (see VOL. XIV). He resigned as a member of the staff of the *New Republic*, in 1915, to become assistant to the Secretary of War. He served also as secretary for the organization directed by E. M. House to prepare data for the Peace Conference. During the War he served as captain of the Department of Military Intelligence. He was attached to the 2d Section of the General Staff at General Headquarters in France. He served also in Paris during the Peace Conference. His later books include *The Political Scene* (1919); *Liberty and the News* (1920); *Public Opinion* (1922). Later he joined the editorial staff of the *New York World* and in 1924 became its chief editorial writer.

**LIQUIDS.** See PHYSICAL CHEMISTRY.

**LISSAUER, ERNST** (1882- ). A German poet. He was born in Berlin and studied at Leipzig and Munich. He first attracted attention by his lyric volume *Der Acker* (1907), which was followed by *Der Strom* (1912), a tribute to the centenary of the Wars of Liberation, entitled *1813*, and *Zyklus* (1913). At the outbreak of the War he published a series of pamphlets, *Worte an die Zeit* (1914), and attained notoriety by his *Hymn of Hate*. He later wrote: *Der Brennende Tag* (1916); *Idyllen und Mythen* (1916); *Das Ewige Pfingsten* (1919); *Der Inwendige Weg* (1920); two dramas, *Eckermann and Yorck* (1921); a series of one-act plays, *Gesichte* (1922); and an appreciation of the genius of Anton Bruckner, *Gloria Anton Bruckners* (1921).

**LITCHFIELD, ELECTUS DARWIN** (1872- ). An American architect, born in New York City. He was graduated from the Brooklyn Polytechnic Institute in 1889 and from the Stevens Institute of Technology in 1892. He began his professional work with Carrère and Hastings in New York and was afterwards associated with several other architectural firms in that city. In 1919, he was a member of the firm of Electus D. Litchfield and Rogers. He designed the United States Post Office and Court House in Denver; the St. Paul Public Library; the James J. Hill Reference Library in St. Paul; and many important buildings in Washington, Brooklyn and other cities. He was architect and town planner for Yorkshp

Village, a permanent industrial town of 1700 houses built during the War for the Emergency Fleet Corporation and the New York Shipbuilding Company. He was a member of several architectural and other societies.

**LITERATURE.** See FRENCH LITERATURE; ITALIAN LITERATURE; GERMAN LITERATURE; HUNGARIAN LITERATURE; RUSSIAN LITERATURE; RUMANIAN LITERATURE; SPANISH LITERATURE; SCANDINAVIAN LITERATURE; SLAVONIC LITERATURE; and LITERATURE, ENGLISH AND AMERICAN.

**LITERATURE, ENGLISH AND AMERICAN.** Any survey of the literature of the last decade must necessarily largely be made in terms of the War. For so profoundly has the fact of conflict conditioned the course of events that even in those fields where its influence has been least direct it has radically altered the background of thought as well as of life. A part of the literature of both England and America deliberately eschewed the War; yet it was inevitably of it. Nevertheless the striking thing that becomes apparent in looking back over the years 1914-24 is that the stream of letters, stirred to the depths as it has been by the period of strife, has followed since the inception and the conclusion of the struggle the direction in which it was setting when it broke. The contest stimulated the revolt which was under way against established conventions of thought and action; it crystallized discontent, fructified emotion, and unfettered expression; but it marks no watershed in literary annals. Its immediate effect, indeed, was rather repressive than submersive, and its results to the present have been rather to nurture seriousness than to transform letters.

The first result of the War, both in England and America, was enormously to increase the output of books which constitute what may be termed the fringes of literature. An amazing avidity of interest in the background of the conflict, and in the psychology of the belligerents, made itself manifest almost as soon as the German hosts began to roll into Belgium, and coincidentally with the issuance of the official explanations of the fighting nations began to appear the vanguard of that army of publications which as the contest developed ranged from inquiry into its causes to description of the manner and incidents of its waging. Speculation as to the means of preventing a similar calamity in the future kept pace with the chronicles of battle and drew into the ranks of the exponents and propagandists many of the leading writers of England and America. Among others Kipling, H. G. Wells, Arnold Bennett, Mrs. Humphry Ward, May Sinclair, Gilbert Murray, Viscount Bryce in England; Edith Wharton, Dorothy Canfield, Richard Harding Davis, Winston Churchill, Owen Wister, Gilbert Parker in America turned their pens to the services of the Allies. Valuable as may have been their work in the developing and sustaining of morale and in familiarizing the public with current international doctrine, from the standpoint of literature it was negligible. Indeed, accurate and animated as was much of the writing of the various phases of the War it was in great part of ephemeral importance. Such books as G. Lowes Dickinson's *The European Anarchy*, Arthur Bullard's *The Diplomacy of the Great War*, Max Eastman's *Understanding Germany*, Bertrand Russell's *Justice in War Time*, Josiah

Royce's *The Hope of the Great Community*, Roland G. Usher's *Pan-Germanism*, and William Stearns Davis's *The Roots of the War*, had wide attention upon publication but they have already passed into the oblivion of topical literature. So too have the multiplicity of volumes recording the impressions of travelers in war-beleaguered Europe, works such as Carl Schreiner's *The Iron Ration*, Madeleine Z. Doty's *Short Rations*, Winston Churchill's *A Traveler in War Time*, Ernesta D. Bullitt's *An Uncensored Diary*, Daniel T. Curtin's *The Land of Deepening Shadow*, Frances W. Huard's *My Home in the Field of Honor*, and Stephen Graham's *Russia in 1916*.

Simultaneously with these more detached discussions came a flood of personal narratives, correspondence from the trenches, chronicles of battle on land, on sea and in the air. Notable in this grist was that mass of soldiers' letters that derived so moving a quality from the idealism that tempered their grim chronicle. At their best, as in the letters of Victor Chapman, Alan Seeger, Rupert Brooke, or Donald Hankey, these volumes that embodied the reactions of youth at grips with the realities of war had an impressive eloquence. Face to face with death, Anglo-Saxon manhood apparently sloughed off the inhibitions and reticences of normal life, and discovered an unsuspected ability to express emotion and experience with clarity and force. Short-lived as was their appeal, any survey of the literature of the war period must take account of these epistles from the trenches.

From the battlefields, too, came the practiced narratives of the war correspondents and official observers, vivid chronicles, which, whatever their limitations of scope, had the virtue of first-hand testimony. In one case at least, that of Masefield's *Gallipoli*, an imagination capable of conveying the epic nature of the drama unfolding before it transmuted a recital of events into stirring literature. And in H. W. Nevinston's *The Dardanelles Campaign*, Philip Gibbs's *The Battles of the Somme*, and the reports of Richard Harding Davis and Frederic Palmer, there was sufficient of literary effectiveness to attach to them a degree of permanence.

It is, however, to other sources to which we must look for the war literature that will be history. So long as the conflict was in progress the necessities of the situation imposed an obligation to silence. But the conclusion of peace released the pens of the diplomats, and lifted the embargo on the utterances of military leaders. From the United States in 1918 came Brand Whitlock's *Belgium*, one of the notable books produced by the conflict, a work of importance historically and possessing no little literary quality. Vivid and revealing as it was, the outstanding diplomatic memoir of the war period was not, however, the Belgian ambassador's but *The Life and Letters of Walter Hines Page*, by Burton Hendrick, a collection of letters impressive for their recital of Anglo-American relations during the war epoch and for the mellow personality and grace of style that invested their record with abiding interest. Together with these reminiscences may be placed as of lesser but nevertheless high interest Ambassador Gerard's *My Four Years in Germany* and *Face to Face with Kaiserism*, Ambassador Morgenthau's *Story*, Lewis D. Einstein's *Inside Constantinople*, and Hugh Gibson's *A Journal from Our Legation in Belgium*.

Close upon the end of the conflict the military leaders entered the literary lists, some of them to combat criticism, others merely to tell the story of their experiences. Viscount French, Sir Frederick Maurice, Julian Corbett, Admiral Jellicoe, Field-Marshal Haig, Commander Belaire, Admiral Fisher, Admiral Sims, Sir Ian Hamilton and others of their associates on land and sea published narratives that must hold permanent place as history. Supplementing these more personal chronicles, and of hardly less value as source books of the future, appeared a stream of books of which some of the most notable were Winston Churchill's *The World Crisis*; *The Economic and Social History of the War*, edited by James T. Shotwell; Charles Seymour's *A Diplomatic Background of the War*, and Woodrow Wilson and the World War; Charles G. Dawes's *A Journal of the Great War*; H. W. V. Temperley's *A History of the Peace Conference at Paris*; Ray Stannard Baker's *Woodrow Wilson and the World Settlement*; and Robert Lansing's *The Peace Negotiations, a Personal Narrative*. Definitive histories of the War it is too soon to expect, but several preliminary treatises presenting panoramic surveys of the contest have made their appearance. Such are Nelson's *History of the War*, by John Buchan; Buchan's *History of the Great War*; Conan Doyle's *History of the Great War*, and Frank Simonds's *The Great War*.

The War while giving rise to a vivid curiosity as to the period immediately antecedent to its outbreak at the same time directed attention to the more distant past. Specialized fields of interest came suddenly to the fore as when the doctrine of self-determination brought the smaller nationalities into prominence, or discussion of a League of Nations threw emphasis on earlier experiments in restraint of war. On the other hand, the entire pageant of history assumed a new significance, and subjected to painstaking research, was made to yield fresh import as its data were interpreted not as by the older historians, through the medium of personal or national prejudice, but with the detachment of scientific investigation. Ancient times as well as modern were tapped at their sources, with the result that the last 10 years have seen a steadily growing body of authoritative history. The important series of Cambridge histories—the *Cambridge Mediæval History*, the *Cambridge History of Modern Times*, the *Cambridge History of India*, the series entitled *The Legacy of Greece and Rome and Our Debt to Greece and Rome*, the *Chronicles of America*, edited by Allan Johnson; *The Second Empire*, by Philip Guedalla; *The Evolution of Parliament*, by A. F. Pollard; *The Age of the Reformation*, by Preserved Smith; *Modern Democracies*, by Viscount Bryce; *The History of the United States since the Civil War*, by Ellis Paxson Oberholtzer; *The McKinley and Roosevelt Administrations*, by James Ford Rhodes; *The Declaration of Independence*, by Carl Becker; *The History of Modern Europe*, by G. P. Gooch; *The Beginnings of New England and Revolutionary New England*, by James Truslow Adams; *The Supreme Court in United States History*, by Charles Warren; *The Conquest of New Granada*, by R. B. Cunninghame Graham—these are a few works representative of the range and character of historical research during the decade.

That in an age of specialization, and at a

period when history more uniformly than ever before had become categorical and documentative, the "outline" should spring to such wide popularity as it attained in the past decade in H. G. Wells's *The Outline of History*, Hendrik Van Loon's *The History of Mankind*, and the books in related fields that followed their fashion, may at first glance seem an anomaly. Yet it is in truth but the logical result of the scientific development of historical study. For history has grown too complex in the light of contemporary research, and in its conjunction with economic, social and environmental factors to be followed by any but the scholar in detail. The outline, with its swift portrayal of the march of mankind from primitive beginnings to the highly organized society of to-day, provides the means to that bird's-eye view of human history which is a minimum essential to the understanding of the present; and when invested with the dramatic quality which the daring of a Wells bestowed upon it, the success of the epitome of history is easily comprehensible.

If history has flourished during the past decade biography has had a no less robust development. More than any field of literature except fiction it has responded to the interest in the new psychology which has been the dominant preoccupation of the last few years. Biographical writing has advanced far indeed from its old conception of a life as a mere succession of incidents to the analysis of such a book as Van Wyck Brooks's *The Ordeal of Mark Twain*. Under the handling of writers who like Mr. Brooks, Lytton Strachey, and Gamaliel Bradford apply though in differing fashion and degree the psychological method to career and personality it has become rather than chronicle an essay in interpretation. As a result it has gained in brilliance and suggestiveness and grown in favor but it has laid itself open to the charge of eccentricity when written by the less scientific and to the danger of being considered an argument to a thesis even when practiced by the ablest of its exponents. Mr. Strachey, whose *Eminent Victorians* and *Queen Victoria* have not only brought biography but almost the Victorian age into favor, applies impressionism to an epoch as well as to personalities, while Mr. Bradford in *American Portraits* and *Damaged Souls* uses a psychological as Mr. Brooks does a psychoanalytical method in his characterization. As a result, biography as it is being written to-day by its most brilliant popular exponents represents not detached description and appraisal but an evaluation in which the personality of the author inevitably fastens its stamp upon that of the hero.

Curiously enough in a period which began in violent reaction against its philosophy and practice, much of the biographical writing of the past 10 years has dealt with the Victorian era. Victorian gods might be dethroned but their shadow was still mighty in the land. From the painstaking research of Monypenny and Buckle's monumental *Life of Disraeli* and the informed chronicle of Lady Gwendolen Cecil's *Life of Robert Marquis of Salisbury* to the audacious egotlatrics of Margot Asquith: *An Autobiography*, Victorian reminiscence has run the gamut of politics and the arts. Government and diplomacy have found spirited reflection in such works as *The Private Diaries of the Rt. Hon. Sir Algernon West*, edited by Horace G. Hutchinson; the *Diaries of Wilfrid Scawen*

*Blunt*; *The Letters of Lord and Lady Wolseley*, edited by Sir George Arthur; Lady Paget's *Embassies of Other Days*; A. G. Gardiner's *The Life of Sir William Harcourt*; Lord Frederic Hamilton's *The Day before Yesterday*; Sir Harry Johnston's *The Story of My Life*; and Kathleen Fitzpatrick's *Lady Henry Somerset*. Literature and art were represented in biographical or autobiographical form in *Unpublished Letters of Matthew Arnold*, by Arnold Whitridge (a book written and originally published in America); *Carlyle till Marriage*, by David Alec Wilson; *Letters of Thomas Carlyle to John Stuart Mill, John Sterling and Robert Browning*, edited by Alec Carlyle; *Thackeray and His Daughter*, edited by Hester Thackeray Ritchie; *The Life of Mrs. Humphry Ward*, by Janet Penrose Trevelyan; W. S. Gilbert: *His Life and Letters*, by Sidney Dark and Rowland Grey; *Changes and Chances*, by H. W. Nevinson; *The Adventure of Living*, by J. St. Loe Strachey; *My Life and Some Letters*, by Mrs. Patrick Campbell; *Letters and Papers of John Addington Symonds*, edited by Horatio F. Brown; *John Ruskin's Letters to William Ward*; and W. H. Mallock's *Reminiscences*. Mr. Mallock's volume, a disappointing revelation of stagnation in mental outlook, presents an interest out of all proportion to its actual merits through its reflection of the persistence into the very maelstrom of the war years of a philosophy of politics and society untempered by the progress of events. By contrast the *Recollections of Viscount Morley*, one of the outstanding biographies of the past 10 years both from the standpoint of literature and that of contemporary history, is all the more notable for ripeness of spirit and spacious mental outlook.

American personal history during the past decade has in some of its most important expression been autobiographical. Close to the opening of the period, Thayer's *Life and Letters of John Hay* wove into a rich pattern public achievement and literary accomplishment, furnishing interesting commentary on contemporary political annals. Few biographies of recent years have equaled in interest from the point of view of psychology *The Education of Henry Adams*, a remarkable human document, in which the author depicts the play of quintessentially New England influences upon a sensitive nature. Like the life of Hay and *The Education of Henry Adams*, the volumes of letters by William and Henry James constitute permanent contributions to literature, the one portraying a mind of widest philosophic scope, sturdy in its Americanism, and the other a personality finding fulfillment possible only outside of its native land, but for all its overlay of cosmopolitanism essentially of it. Racy of the American background, though in widely variant fashion, are Hamlin Garland's *A Son of the Middle Border*, and *A Daughter of the Middle Border*, with their vivid depiction of pioneer life; Theodore Dreiser's *A Book about Myself*; Theodore Roosevelt's *Letters to His Children*; Robert Underwood Johnson's *Remembered Yesterdays*; M. T. Werner's *Barnum*, the record of a career unthinkable outside of America; Royal Cusins's *Life of Whitelaw Reid*; Henry Watterson's recollections; Kate Douglas Wiggin's *My Garden of Memories*; the life of E. H. Harriman; *The Americanization of Edward Bok* and Michael I. Pupin's *From Immigrant to Inventor*. Political biography added

to its credit during the past decade Joseph Bucklin Bishop's *Life of Roosevelt*; the authorized biography of Grover Cleveland, by Robert McElroy; *Samuel Adams, Promoter of the American Revolution*, by Ralph Volney Harlow; *The Life of Roger Brooke Taney, Chief Justice of the United States Supreme Court*, by Bernard C. Steiner, and Beveridge's exhaustive life of Chief Justice Marshall, indispensable to the student of his period.

Perhaps of all forms of literature the essay most demands for its fertilization the quiet and contemplative mind. War, and the aftermath of war in radical thought and propaganda, were little conducive to armchair philosophy, and the dearth of outstanding work in the field of the essay during the greater part of the decade is easily explicable in view of the prevailing turmoil. Both in England and America, however, the essay and the essay in criticism have increasingly been coming into their own in the past few years. In the United States, indeed, criticism has had a development which is one of the most striking features of contemporary American literature. Never before in this country has there been so widespread a public for critical writing, or so many organs devoted partially or predominantly to its uses. Stuart P. Sherman, Paul Elmer More, H. L. Mencken, Henry S. Canby, Carl Van Doren, Van Wyck Brooks, and a goodly fellowship of able if less noted critics have produced works of genuine distinction. If a greater urbanity still marks the work of the English critics a compensatory eagerness may be placed to the credit of the American.

The decade of 1914-24 was, except for the development of its fiction, most striking for its renaissance of interest in poetry; and in poetry, as in fiction, it has been the American contribution which has been of peculiar interest. When the War broke out in 1914, it found America riding on the crest of a wave of poetical experimentation, which derived primarily from France, but which struck its roots deep into American soil, and drew from it sinews and strength. Free verse, as the new poetry was termed, and as it was expounded by Amy Lowell, and practiced by Edgar Lee Masters, Carl Sandburg, Vachel Lindsay and other of its serious exponents, is "a verse form based on cadence." It eliminates the recurrent rhythm of the line, and regards the group of lines as the unit of verse. It claims thereby to attain a flexibility and compass impossible to poetry in traditional meters; "free verse," says Miss Lowell, "within its own law of cadence has no absolute rules; it would not be 'free' if it had." Nor has it regard for the restrictions imposed in the past on the content of poetry. It holds to a belief in "exteriority" or "objectivity," rejecting the traditional abstractions of poetry for the concrete and the scientifically accurate. And it strives to convey its meaning through a clear-cut imagery which in the hands of an essential classicist like H. D. or an artist with the craftsmanship of Miss Lowell produces poetry of genuine beauty and in those of a Carl Sandburg or an Edgar Lee Masters verse of rugged power. But free verse has not been consistently at ease in the house of its friends; it has been torn and tortured by the wilder experimenters like Kreymsborg and Pound, and it has been the excuse for the entrance into the lists of poetry of numbers of persons whose only qualification

for its writing is the ability to shuffle off conventional forms. Nevertheless it has been a vigorously fructifying force in American literature, and though it is safe to say that a reaction has set in at present against it, there is no doubt that it has to its credit not only new and valuable metrical achievements but the sudden outcropping of magazines of verse and poetical criticism that have both reflected and stimulated the growth of interest in poetry.

That the Imagist precision of diction and sharpness of impression are capable of attainment without sacrifice of traditional metrical forms, the work of Edwin Arlington Robinson, by many critics adjudged the greatest contemporary American poet, and of Robert Frost abundantly prove. Robinson's ironical and analytical intelligence, playing upon rustic characters and scenes has produced poetry of highly realistic power in his portrayal of New England life. His method, however, which is indirect, and the frequently difficult texture of his thought, have prevented his works from capturing the popular fancy as did the grim realism of Edgar Lee Masters's epitaphs in the *Spoon River Anthology*. Robert Frost, on the other hand, who wraps the commonplaces of New England life in a kindly irony, has won popular favor as well as critical approval with *North of Boston* and *Mountain Interval*. And Miss Lowell herself, *vers librist*, imagist, and originator of what she has termed polyphonic prose, has shown herself competent to produce as admirable effects in conventional meters as in the new. Most of the American poets of standing, Conrad Aiken, Witter Bynner, William Rose Benét, Stephen Benét, Louis Untermeyer, to mention but a few, have written at times in free verse, though perhaps their best expression is found in the old forms. An interesting experimenter of different sort has been Vachel Lindsay, who first in the *Congo and Other Poems* and later in other interesting narrative poems, attempted to approximate his lyrics to a chant, employing various typographical devices to develop his effects.

In 1924 some of the most, if not the most distinguished poetical work was being done by two women who only within the past few years had come to the fore, Elinor Wylie, whose *Nets to Catch the Wind* and *Black Armor* have been followed by a novel, *Jennifer Lorn*, as striking in execution as her verse, and Edna St. Vincent Millay whose *Second April*, *Renascence*, *Harp-Weaver* and *Figs from Thistles* all have no less fine an art than her Elizabethan play. Miss Millay's strength lies in the abundant lyric beauty of her lines, in a sort of naïveté combined with passion, and in a technical proficiency that cloaks the cleverness of its performance in the ease of its accomplishment. Mrs. Wylie's work has remarkable precision and chastity of outline, perfection of form and brilliance of execution, an emotion that, as one of her critics has said, "burns with cold fire," and more depth of thought than Miss Millay displays. Theirs is on the whole the most promising talent of the day.

The English poets have in the main been less influenced by the new verse forms than their American fellows, and have correspondingly less sought their subjects in the commonplaces of life. Imagism under the influence of the transplanted Americans, H. D., Ezra Pound, and

T. S. Eliot, has been productive of interesting results, and in the case of H. D. of its most perfect expression. But in England as in America a reaction against it is under way.

English poetry has more than American sought its interest in narrative themes, having achieved in the work of John Masefield probably the most significant poetic output of the Anglo-Saxon world during the decade. The sea and the English countryside have engaged Masefield's efforts, and an intense concern for man at his coarsest and most humble has lent an imaginative and moving quality to verse of often noble diction. Had he survived, Rupert Brooke, whose war sonnets gave evidence of growing beauty and power, might have written his name large in the annals of English poetry. The War, indeed, developed a notable output of verse, the most able of its exponents being James Elroy Flecker, "the last of the Parnassians," Robert Graves, Robert Nichols, Wilfrid Owen, Siegfried Sassoon, Edmund Blunden, Isaac Rosenberg, and Richard Aldington. In striking contrast to the bitter mood of the war period is the pastoral character of the work that men like Graves and Blunden are doing to-day. The lyric tradition of British poetry has further been carried on by Wilfrid Wilson Gibson, John Drinkwater, Ralph Hodgson, and Walter de la Mare. Hardy, Bridges and Kipling have continued to write and A. E. Housman in *Last Poems*, published 28 years after his previous volume of verse, *A Shropshire Lad*, has added a permanent contribution to the poetical literature of England. At the other extreme from these poets stand the Sitwells, the representatives of the most revolutionary poetical doctrine.

Interesting as has been the course of poetry during the past decade the developments in fiction have held the centre of the stage. And in fiction as in poetry it is in America that the most striking evolution has taken place. The War found the English realists in command of the field and the post-war period has seen the continuance of their sway. Sex, and more latterly psychology, have supplanted the interest in social problems and injustices which were so dominantly the preoccupation of the closing period of the Victorian era and the opening years of the twentieth century; yet such writers as H. G. Wells and John Galsworthy still continue the sociological tradition. Wells, with his exuberant fancy, his perennial zeal for reform, his distinguished didacticism, and his daring in applying scientific doctrine to romance, has produced a series of novels which like the plays of the no less ardent moralist, Bernard Shaw, are the vehicle for the promulgation of the author's social and spiritual gospel. *Mr. Britling Sees It Through*, the most successful war novel of the Anglo-Saxon world, no less than *Joan and Peter* or *The Secret Places of the Heart* revealed Mr. Wells himself. Mr. Galsworthy's preoccupation has remained predominantly social, even where as in his war novel, *Saint's Progress*, he has become immersed in an emotional situation. In his *Forsyte Saga*, an analysis of the possessive instinct as exemplified in an English family, both his art and his social outlook have found expression in a series of novels that take rank with Arnold Bennett's studies of the English countryside as among the most notable contributions to Anglo-Saxon fiction of the century. From *Old Wives' Tales* to

*Riceman's Steps*, despite several insignificant novels, Bennett's realism has translated the commonplace from dullness to dignity by lifting it to the plane of the universal and thereby investing it with poignance lacking to such work, for instance, as the quiet annals of Archibald Marshall.

If social relationships have continued primarily to interest certain of the English novelists it is the pastures of the soul that have captured the interest of more of them. J. D. Beresford, May Sinclair, Compton Mackenzie, Rebecca West, Frank Swinnerton, Dorothy Richardson, Sheila Kaye-Smith, H. G. Wells, Aldous Huxley have all set themselves to its exploration with the result that the psychological novel, now frequently the psychoanalytical novel, has become the most conspicuous type in English fiction to-day. In such novels as May Sinclair's *Mr. Waddington of Wyck*, Rebecca West's *The Return of the Soldier*, Sheila Kaye-Smith's *Joanna Godden*, or H. G. Wells's *Secret Places of the Heart* it differentiates itself sharply from the specifically sex novel as written by George Moore and in its extremest form exemplified by D. H. Lawrence, while in the work of an author like Aldous Huxley it becomes naturalism. A remarkable example of the psychological novel is to be found in James Joyce's *Ulysses*, the hundreds of pages of which chronicle the stream of consciousness as it passes through one man's mind over a period of 24 hours. Various considered a work of genius and a dull abnormality it is at least important in its influence on the development of expressionism.

The largest figure of contemporary English fiction was undoubtedly Joseph Conrad whose novels of the sea and adventure draw their deepest interest not from their incident but from their splendid projection of the conflict of human emotions under the play of forces extraneous to themselves as well as inherent. It is a noble psychology which Conrad has outlined, moving, pregnant and touched by a profound compassion, presented in rich and virile manner, and transfused by a high imagination. Work of the last few years that stands out by reason of its singular subtlety is that of *The Garden Party* and *The Dove's Nest*, by Katherine Mansfield, whose delicate art was ripening into fuller achievement at the moment of her untimely death. In their ability to suggest the shifting play of mood and feeling, and their clear-sighted understanding of human reactions, her short stories gave promise of a genuinely high talent.

Despite the predominance of the interest in psychology, the purely romantic and the fantastic still hold their own in English fiction. In the case of Walter de la Mare, a gifted and richly endowed poetic fancy in combination with broad human sympathy have produced in *The Memoirs of a Midget* a work which, easily capable of grotesquerie, is in actuality a tender and convincing characterization. So too in David Garnett's *Lady into Fox* and *A Man in the Zoo*, the improbable and the fantastic are welded into harmony with a conceivable reality through a singularly unified conception and execution. Like the fantastic tale the novel of manners has continued to hold place in England, having found particular popularity in the work of Rose Macaulay whose *Potterisms* and *Dangerous Ages* have skillfully held up to view a type of contemporary Briton whose muddled

thought and sentimentality the War brought into prominence.

Noteworthy as a large part of British fiction during the past decade has been, and distinguished as its craftsmanship, on the whole the English novel has been flat in comparison with the American. For in America, forces that were stirring before the War, and that were brought to full growth in the heat of battle, have resulted in a literature of revolt remarkable alike for its vigor and its vehemence. Within the last decade American fiction has left off its swaddling clothes and arrived at maturity. A generation after the influence of Zolaism has passed in France and England it has arrived at naturalism. It no longer acquiescently accepts the world, and especially its particular corner of it, at its own valuation, but it has taken to investigating it for itself scientifically; and great has been its disillusionment. What formerly it deemed fair it now has discovered to be at bottom ugly and binding. The ease of American life it reads as stultification, its uniformity as desperate monotony, and its complaisance as promise of disaster. It has set itself to the high task of saving America from itself by joining battle with the dullness, the restrictions, the narrowness of its life. Especially against the village has it turned the power of its attack. And in its efforts to come to grips with realities it has introduced into American literature an acerbity completely foreign to its past. Sinclair Lewis's *Main Street* and *Babbitt*; Sherwood Anderson's *Winesburg, Ohio*, and *Poor White*; Zona Gale's *Miss Lulu Bett*; Floyd Dell's *Moon-Calf* burn with a passion of indignation. They are tracts as much as novels—tracts against monotony, against convention, against rigid social codes. Their propagandism is their limitation as well as their strength. Embittered by the same sudden awareness of the ugliness of life are the works of the writers of the more extreme expressionist school, Evelyn Brown, Carl Van Vechten, Waldo Frank, Ben Hecht and a group of lesser novelists whose concentration on the abnormalities of life converts their fiction into pathology. No less a challenge to existing conditions is the attitude of the "younger generation" to whom Scott Fitzgerald's *This Side of Paradise* set a model for depicting the breakdown of decorum and convention, and Dos Passos's *Three Soldiers* established a norm for frank speaking.

Side by side with the naturalistic movement has continued a milder realistic stream. Booth Tarkington; Edith Wharton, whose *Age of Innocence* with its acid delineation of a New York that had not yet acquired self-consciousness confirmed her position in the forefront of American novelists, Joseph Hergesheimer, Willa Cather, whose delineation of American life displayed its nature without the social criticism implicit in the work of Sinclair Lewis; Dorothy Canfield; Fannie Hurst; Robert Herrick, Charles G. Norris have proved virility and closeness to life of fiction in America. Playing on another plane is the unique talent of James Branch Cabell, whose theory that art should be based on a dream of life as it should be and not as it is, and that it must therefore tend "to become more or less of an allegory," has resulted in a richly tapestried series of romances of the Middle Ages and of present-day Virginia. A very genuine gift for fiction showed itself in Elinor Wylie's *Jennifer Lorn*; a "sedate ex-

travaganza" that sustains the manner and style of the eighteenth century with amazing success throughout its fantastic course.

Despite the seriousness which has become the most marked characteristic of American fiction, and despite its absorption in the commonplace, the story of mystery, of adventure, the society novel, and the love story pure and simple continue to flourish. Both in England and America there has been an amazing output of mystery and detective tales, and in both countries trash of the first order attains to best-sellerdom.

Briefly to summarize, Anglo-Saxon fiction while it has produced no masterpiece has shown a sturdy development and a constantly closer approximation to the problems and interests of everyday life. In America the trend to naturalism and on both sides of the ocean the application of the findings of science and especially of the new psychology to the interpretation of life have been the outstanding developments of the period. While the British novelists have displayed a surer and more accomplished craftsmanship the Americans have shown more ruggedness and intensity and a more bitter attack upon the strongholds of custom.

In drama the notable fact has been the passing of the closet play, and the concern with the interests and problems of the day. Bernard Shaw has remained the outstanding satirist and moralist of his time, while Galsworthy has continued to use the stage as a means for protest against social abuses and injustices. Barrie, Lord Dunsany and Lady Gregory have produced work of delightful whimsy and fancy, while Drinkwater with his *Abraham Lincoln*, Clemence Dane with her *Will Shakespeare*, and Bernard Shaw with *Saint Joan* have brought the historical play into favor. Shaw's amazing *tour de force*, *Back to Methuselah*, should have special mention. In the opinion of many critics the most considerable dramatic work of the decade in America has been that of Eugene O'Neill. For discussion of the drama in detail see the article THEATRE.

It is interesting to note that economic and social science has much advanced in public interest under the handling of such writers as Graham Wallas, R. H. Tawney, John Maynard Keynes and other writers whose scientific accuracy is in no way impaired by their ability to write for the lay intelligence. Their work, however, falls without the scope of an article on literature.

In concluding a survey of the decade begun by the War, attention must be drawn to the increase of interest in foreign literature which followed in the wake of the conflict. International-mindedness indeed is one of the most strongly marked trends of the period. The fiction of Spain, Scandinavia, Holland, and Russia as well as that of France and lately of Germany has been translated and widely read. The criticism and art discussion of foreign lands has had broad currency, and the war memoirs and older biographies of the European nations have taken place beside similar chronicles in the English tongue. America, at least, has broadened its horizons in a decade as never before in a century and in that fact, as well as in its sudden waking to self-realization, lies rich augury of future achievement.

**LITHOPONE.** See CHEMISTRY; ZINC.

**LITHUANIA.** One of the new Succession States, created out of the former Russian Em-

pire after the War. The claims of the Lithuanian government included: the whole of the former Russian province of Kovno; the province of Vilna, minus the districts of Disna and Vileika; a part of the province of Grodno north of the Niemen River; the province of Suvalki; part of the province of Courland; the Memel District. According to 1914 figures, this territory had an area of 151,491 square kilometres (59,633 square miles) and 4,800,000 inhabitants. The eastern frontier was defined in the Russo-Lithuanian Treaty of July 12, 1920; the fixing of the northern frontier was provided for in a convention with Latvia on Sept. 28, 1920, by which the line was to be laid down by an English arbiter. To the south, however, no agreement was reached by 1924 (see below). Both Poland and Lithuania laid claim to part of the province of Suvalki, the province of Vilna, and Grodno province. The actual area under the control of the Lithuanian government was only 33,000 square miles, and the population (1923 estimate) 2,011,200 of which 86.7 per cent was rural. Ethnographical Lithuania, i.e. the territory included in the claims of the government, was comprised of 73.5 per cent Lithuanians, 12 per cent Jews, 4.3 per cent Poles, 2.5 per cent White Russians, 1.5 per cent each Germans and Russians. Vilna, the capital, claimed by Lithuania, had in 1914, a population of 214,600; other large towns were: Kovno, the seat of government (92,000), Grodno (61,600), Memel (32,000), Suvalki (21,240), Shavli (21,240). These towns were in both political and ethnographical Lithuania.

**Religion and Education.** In the most important provinces, Vilna, Kovno, and Suvalki, Roman Catholics formed 75 per cent of the population, Jews 12 per cent, Greek Orthodox 9 per cent, Protestants 4 per cent. In 1922, there were 1708 primary schools with 160,230 pupils and 93 secondary schools with 17,149 pupils. In 1922, the University of Kovno was opened with 25 professors and 800 students.

**Industry and Trade.** The population was preponderantly rural in character. Of the total area it was computed that 45.8 per cent was arable land, 24.3 per cent meadow land, 20.3 per cent forest, and the rest unproductive and waste. In 1923, 540,800 hectares were under winter rye and 76,000 hectares under winter wheat. Principal crops in 1922 yielded, in metric tons: rye, 535,000; oats, 264,000; barley, 146,000; wheat, 78,000; potatoes, 1,386,000; flax, etc., 42,000. In 1923 there were 505,500 horses, 1,285,000 cattle, 1,413,000 sheep, and 1,897,000 pigs. Poultry farming and bee keeping were also important. Forests cover 2,065,000 acres of which 889,600 were owned by the state. By the treaty with Russia, Lithuania received 247,000 hectares of forests as compensation for damages. The leading internal question was the distribution of the large landed estates and by 1922 it was evident that expropriation was to be the plan adopted, without compensation. The agrarian law of February, 1922, provided for the expropriation of all holdings in excess of 80 hectares. The want of capital and the unsettled condition of Central Europe made the reversion to an exclusive agricultural economy the only means for the maintenance of an ordered national life. The government applied itself to this purpose, adopting the following measures: the teaching of the principles of scientific agriculture, the replenish-

ment of the herds, the increasing of the arable area, in order to make possible greater export of agricultural products. These plans were meeting with success, for by 1920-21, 10 per cent of the barley, rye, and wheat, half of the flax, and a good deal of the poultry, were exported.

Immediately after the War there was no revival of industry, the destruction caused by belligerent armies and the lack of raw materials together with the dismantling of the larger plants being insuperable obstacles in the way of a resumption of activities. What commercial intercourse there was partook of the nature of an exchange of agricultural products for finished manufactured articles. The trade for 1922 and 1923 was:

|               | 1922        | 1923         |
|---------------|-------------|--------------|
| Exports ..... | \$7,690,000 | \$14,680,000 |
| Imports ..... | 7,490,000   | 15,660,000   |

Chief exports were: corn, cattle, hams, dairy products, flax, linseed, timber, hides, and wool. Chief imports were: manufactured articles, agricultural machinery, fertilizers. In 1923, almost all the imports (82 per cent) came from Germany; England supplied 5 per cent; United States 2 per cent. Principal countries of destination of exports were Germany, 43 per cent; England, 27 per cent; Latvia, 16 per cent.

**Communications.** There were only about 930 miles of road in the whole country. There were 1995 miles of railway, including Memel, in 1923. The most important lines were: The Wirballen-Kovno-Koszedari line; the Janov-Shavli; the Koszedari-Jewie. Also 117 miles of waterway were navigable for steamboats, and 453 miles for smaller craft. The most important, the Niemen River, was internationalized by the Treaty of Versailles. See MEMEL.

**Finance.** In 1921 the revenues were 672,582,658 Lithuanian marks and the expenditures 885,725,375 marks. For 1922, the budget estimates balanced at 4,312,280,089 marks (roughly, \$7,000,000). For 1923 revenues exceeded expenditures, which totaled \$19,860,000. Up to 1923, the depressions of the German mark seriously affected the Lithuanian currency because much of the discounting business was done in Germany. On Oct. 1, 1922, a new currency law provided for the creation of a national currency based on the gold standard, with the *lit* (equal to one-tenth of the American gold dollar) as unit. Paper currency in circulation on Dec. 31, 1923, totaled 60,074,300 lits (\$6,007,430); backed by gold reserve of 16,446,200 lits; silver in circulation was 254,800 lits, and foreign currencies 46,521,800 lits. The Lithuanian foreign debt, in 1923, was put at \$7,000,000.

**Government.** After working for two years, a constituent assembly finally promulgated a constitution on Aug. 1, 1922. This provided for a nationally elected diet (Seim), chosen every three years on the basis of universal suffrage and the proportional system, to make the laws, ratify treaties, approve the budget, and choose the state president. The ministry was to be selected by the president but was to be held responsible to the diet. Cultural autonomy was provided for national minorities, viz., Jews, White Russians, and Poles, and religion and education were to be unhampered. The economic clauses provided for state regulation of lands and estates; state insurance for

the aged, infirm, and unemployed; freedom of organization, and the right to strike. Up to the first national election (Oct. 10, 1922), the government was in the hands of a Christian Democrat-National Socialist bloc, representing the peasants, and the opposition was made up of the Social Democrat and Polish parties. The first election returned 78 members grouped as follows: 38 Christian Democrats, 19 National Socialists, 11 Social Democrats, 3 Jews, 2 Poles, 5 Communists. The first president was A. Stulginskis, president of the constituent assembly, who was appointed Dec. 21, 1922. The government was formed by a clerical-agrarian combination, which continued in power after the May election of 1923.

**History.** The policy of Russianization that characterized imperial rule in Lithuania during the nineteenth century was maintained in the twentieth century, even though, in 1905, a Lithuanian National Assembly was called in session during the Revolution. It was not until 1915 that the Russian grip was broken, to be replaced (unfortunately) by the German. From 1915 to 1919 a German army held the land and the exploitation of its resources and scrapping of its factories did much to impoverish the country for years to come. The policy of the Germans aimed at eventual annexation; the erection of a Lithuanian State Council in 1917 was tolerated and Lithuanian independence was nominally recognized by Germany in March, 1918, but a German monarch, Prince von Urach of Württemberg, was nominated as the future king, the German administration was maintained, and the German army stayed on in the country until late in 1919, living off the land and pillaging at will, having the weak provisional government at its mercy. The outcome of the War, however, put an end to these intrigues. Bolshevik forces now succeeded the German and fighting was sporadic throughout the whole of 1919. In January, 1919, a conference of Lithuanian patriots reestablished the Tariba, or National Council, which had been formed in 1917, organized a cabinet, and proclaimed a provisional government. This government, however, was driven from Vilna, its capital, to Kovno, which in turn was soon threatened by Bolshevik invaders. At the same time the Bermondts branch of Von der Goltz's mercenaries had to be beaten off, while Polish troops were continually being engaged in 1919-20. By the spring of 1920 the situation had improved to such an extent that a constituent assembly could be convened, to reiterate the declaration of independence, begin work on a constitution, and open negotiations with Russia. The first ray of hope for the young nation appeared in July, 1920, when Russia came to terms with its succession state on a remarkably liberal basis. Lithuania was freed of its share of the Russian state debt; was compensated with 3,000,000 gold rubles; received 100,000 hectares of forest land; and had its ethnographic frontiers recognized, including the right to Vilna and Grodno.

The Polish difficulty could not be terminated so easily. Vilna was occupied by a free-lance Polish army in October, 1920, with the result that recourse had to be taken to the League of Nations (q.v.). Though the Polish government disavowed the raid, the insurgent army could not be dislodged and it was necessary late in 1920 to dispatch an international force into

Lithuania to end the conflict. Nothing was accomplished and it was not until November, 1921, that the rebel leader, Zeligowski, voluntarily withdrew. Throughout 1921, 1922, 1923, all attempts to adjudicate the Vilna controversy were fruitless. The plebiscite plan first broached by the League of Nations had to be abandoned in 1921 in favor of direct negotiations between Lithuania and Poland, and these proving unsuccessful, was adopted again. Finally on Jan. 8, 1922, an election was held in the Vilna district and the diet thus chosen decided on February 20, by a vote of 96 to 6, for union with Poland. Lithuania refused to accept the result on the ground of irregularities and in this was upheld by the League of Nations Council. But on July 18, Vilna was incorporated into the Polish nation, and the League of Nations, accepting the *fait accompli*, appointed a commission to fix the boundary line. On Mar. 16, 1923, the Council of Ambassadors, in laying out the eastern and northern Polish boundaries, included the Vilna district, despite the still strenuous objections of the Lithuanian government. In 1924, hostile forces still confronted each other on the disputed frontier. In its attempt to acquire the Memel district (910 square miles), formerly belonging to Germany, as its only outlet to the Baltic Sea, Lithuania was likewise thwarted for a time. By the Treaty of Versailles, the district north of the Memel River, including the port of Memel, was turned over to an Allied commission presumably in trust for Lithuania. In 1922, a movement for a free state, encouraged by Poland, was under way with the result that the French in charge refused to cede the district to Lithuania. It was not until Feb. 16, 1923, after a show of arms, that Lithuania received Memel on condition that Poland be permitted to use the port (see MEMEL).

On Sept. 21, 1921, Lithuania was admitted to the League of Nations. On Mar. 23, 1918, it had received *de jure* recognition by Germany; on July 12, 1920 by Russia; and on Dec. 20, 1922, by the Great Powers. A commercial treaty was signed with Great Britain in May, 1922, and with Germany in June, 1923. The latter also contained political provisions which pointed toward a closer understanding.

**LITTLE, ARTHUR W.** (1873- ). An American printer and publisher, born in New York City. He was educated in private schools and in 1891 joined the company of his father, J. J. Little & Company, printers. He served in the State Guard in New York from 1891 to 1912. In the War he served in France with the 369th United States Infantry, colored, as regimental adjutant and major, and took part in all actions with Gouraud's 4th Army. He was wounded in action Sept. 12, 1918. He was made a Chevalier of the Legion of Honor and received four Croix de Guerre.

**LITTLE ENTENTE.** The series of agreements and treaties entered into by Czechoslovakia, Jugo-Slavia, Rumania, and on occasions Poland, for the protection of their mutual interests, was commonly called the Little Entente. It was ostensibly an alliance for defensive purposes in case of an unprovoked attack from Hungary, but in reality it embodied an all-embracing policy aiming at the maintenance of the status quo on the European continent resulting from the Peace Treaties of Versailles, St. Germain, and the Trianon. Since

the precarious national existence of the Central European Succession States was part of the settlement attempted in these treaties and was an outgrowth of the French desire for security, the Little Entente may with justice be regarded as having begun with the Peace Conference and as being part and parcel of the French continental policy. In her desire for security, France became at the Peace Conference the sponsor of the most extreme claims of the Czechs, the Poles, the Serbs, and the Rumanians, in order to make the new states formed by these peoples as strong as possible and to create out of them a bloc as France's ally against Germany. Hence the new states were given contiguous frontiers and direct railroad communications and practically no regard was shown for the wishes and the economic necessities of the inhabitants of the border districts. The Succession States, on the other hand, when they found themselves so generously endowed, were quite ready to fall in line. The more territory they acquired, the greater became their desire for more, and they treated their alien minorities as harshly, if not more harshly, than they themselves had been treated before by their German, Magyar, or Russian masters. More flagrant even than the violation of ethnical principles was the disregard shown for economic considerations. The economic unity which was the most plausible justification for Austria-Hungary's existence was destroyed by the treaties primarily because the Allies wished to block Germany's penetration into the East. The disruption of economic intercourse with the German network of ports, rivers, canals, railroads, etc., of which they were the natural hinterland, left the Succession States economically hanging in the air. The result of the settlement was thus a patchwork of new states saddled with alien minorities counting many millions and faced with political unrest and economic chaos. This being the situation, security for France and the Succession States lay only in the closest coöperation toward a continuation and consolidation of the existing status by military effort. The only means of accomplishing this was the formation of a "cordon sanitaire" of the new states around Germany, to prevent the rise of the Germans and the Magyars and their union with Russia. In pursuit of this aim France set out to strengthen these states as far as possible by granting them generous loans toward the building up of powerful armies, disproportionate to their size and true interests, and by missing no opportunity of supporting their excessive territorial demands at the expense of Germany and her potential friends. Most important to France in this respect was Poland, because its interposition between Germany and Russia destined it to be the bulwark in the "cordon sanitaire."

The most essential prerequisite for the success of this policy was the conclusion of a definite alliance between the Succession States based on community of interests and the coöperation of this compact group with the French policy. On Aug. 13, 1920, a convention was signed between Czecho-Slovakia and Jugo-Slavia which provided for mutual help in case of unprovoked attack. When the efficacy of this alliance for the maintenance of the status quo had been sufficiently demonstrated on the occasion of the prevention of the restoration of Emperor Charles to the throne of Hungary, Rumania joined on Apr. 23,

1921. The immediate concern of this tripartite defensive alliance or Little Entente was the consolidation of its position, which was successfully carried out during the following years. Its intervention frustrated, in September, 1921, a second Habsburg Putsch in Hungary, and it coöperated with France in blocking the union of Austria with Germany. By means of a coercive policy, Austria and Hungary were subsequently compelled to submit in every respect to the wishes of the Little Entente and to seek a closer accord with it. Thus a frontier incident between Hungary and Rumania in January, 1923, brought about a partial mobilization of the Little Entente, in the face of which Hungary was powerless. Similarly, in seeking a loan abroad Hungary had to comply with the conditions laid down by the Little Entente at the Sinaia Conference in July, 1923. While Austria was also coerced into dependence on the Little Entente, open union with the latter as a way out of the difficulties besetting the little republic was vetoed by Italy, which objected to a strengthening of the influence of France and the Little Entente on her northern frontier. The Italians were not without justification in sensing in the formation of the Little Entente a veiled threat against their interests in Central Europe and the Adriatic. Although some of the difficulties between the Little Entente and Italy were subsequently ironed out by the Treaty of Rapallo between Italy and Jugo-Slavia and by the Fiume settlement of Jan. 27, 1924, it remained an open question, in 1924, how far these and other pacts had actually removed the deep-rooted friction between the Little Entente and Italy. Absolute accord seemed impossible as long as the Little Entente remained the guardian of French interests. Poland never joined the Little Entente officially. She did, however, on all important matters coöperate with the latter to an extent which made her an unofficial fourth member of the alliance. In accordance with an agreement reached at the Belgrade Conference in March, 1922, Poland, Czecho-Slovakia, Jugo-Slavia, and Rumania operated as a quadruple alliance at the Genoa Conference. This bond was further cemented at the Prague Conference on Aug. 27-28, 1922, by a further agreement as to community of action. Within the years 1922-24 this union of interest and action between Poland and the other three Succession States grew, if anything, more firm. The position of the Little Entente became more consolidated with each successive year through conferences and treaties between the individual members and an ever-progressing understanding with France. France's system of binding these states to her policy by rendering them military, financial, and diplomatic assistance reaped its greatest success in the conclusion of the Franco-Czech Alliance on Dec. 27, 1923 (signed Jan. 25, 1924). By this treaty the two countries pledged themselves to render each other military assistance in case of an unprovoked attack by a third party and to guarantee the full execution of the Peace Treaties. In substance this amounted to a military alliance in favor of the maintenance of the territorial status quo and of the domination of Central Europe by France and the Little Entente, and as such it aroused grave apprehension and adverse criticism in Italy and Germany. At the Belgrade Conference of the Little Entente the extension of this treaty to include the other

members of the Little Entente was under discussion, and while no definite action was taken then, such a step, in the summer of 1924, appeared to be more than a possibility. See CZECHO-SLOVAKIA; FRANCE; ITALY; JUGOSLAVIA; POLAND; RUMANIA.

**LITTLETON, MARTIN WILIE** (1872- ). An American lawyer, born in Tennessee. He was self educated and after studying law was admitted to the bar in 1891. For several years he practiced in Dallas, Texas, and then removed to New York, where he at once took a prominent place in legal circles. Becoming active in politics, he was assistant district attorney of Kings County from 1900 to 1904, and president of Brooklyn Borough in 1904-05. He served as delegate from New York to the Democratic National Convention in 1904 and presented the name of Alton B. Parker for President. From 1911 to 1913, he was a member of Congress for New York.

**LIVE STOCK.** The live stock situation during the decade following 1914 was somewhat unstable. Prior to the War there was an increasing tendency toward a reduction in the per capita consumption and production of meat in the United States and in the world in general. The War, however, acted as a great stimulus to meat production in the United States. At first the effects of rising feed prices tended to start a temporary liquidation of animals in 1915 and 1916, but as the world's shortage of meat became evident, prices of meat animals increased. As early as 1913 the dwindling per capita production of meat also stimulated production in the more remote and thinly populated areas of the world where previous evidence had indicated that beef production might thrive. Consequently the United States packers began to establish plants in South America. The calculated per capita consumption in the United States of meats including lard was 154 pounds in 1914, dropping as low as 143 pounds in 1917 and rising in 1922 to 164 and in 1923 to 183 pounds. The greatest portion of this increase was due to an increase of 33 pounds in the per capita consumption of pork. The increased demands for meats and the high prices offered caused many light cattle to be slaughtered during 1917 and 1918, thus tending to reduce the total amounts of meat produced. In order to assure a good price for meat animals during the encouragement of meat production in the United States during the War, several conferences were held under the direction of the United States Food Administrator and the Secretary of Agriculture relating to the profits to be expected by packers and to the relative prices of corn and pork. Although no prices were guaranteed as the result of these conferences, plans were adopted for licensing the packers and seeing that their profits should not exceed 2.5 per cent of the sales. It was also suggested that beginning in 1917 an effort would be made to maintain the price of hogs per 100 pounds at 13 times the price of corn per bushel. Under these plans, the United States Department of Agriculture in cooperation with the State agricultural colleges endeavored to increase pig production about 15 per cent during 1918. These efforts met with much success.

The peak of meat prices was reached in 1919 with practically all classes of animals, and live stock producers were enjoying a more prosperous position probably than ever before, although

a severe drought in the Southwest ending in 1918 and followed by one in the Northwest tended to handicap feeders and breeders alike in those sections. Following the prosperous conditions of 1919 there was an irregular decline in both pork and beef prices during 1920, choice and prime beef dropping from \$19.25 per 100 pounds at the first part of the year to \$13 at the end of the year. Hogs advanced to \$18.25 on September 25, followed by a sharp decline to an average of \$8.97 on Dec. 15, 1919. The situation was, therefore, very critical for beef and hog producers, but the outlook for the sheep breeder was even more demoralizing. Wool dropped from \$0.72 on the range to a condition where no market at all existed. The prices of live stock continued to fall through 1921, reaching low levels at the end of the year. Although the European countries were still suffering from the loss of many of their animals during the War, they were unable, due to poor exchange rates and a lack of credit facilities, to purchase any great amounts of meat. At the end of 1921, however, conditions began to show more promise, and some meat products, especially pork, were exported to western Europe. Conditions in 1922 were somewhat better, especially for the sheep raiser, and the passage of the McCumber-Fordney Tariff bill placed a heavy duty on all mutton, lamb, and wool imported. During 1923 a peculiar situation existed which apparently was unexpected, resulting in an unprecedented slaughtering of hogs and a reduction of hog prices to low levels of less than \$7 per 100 pounds in December. The following table indicates the annual fluctuations in the numbers of animals slaughtered under Federal inspection in the United States, and the estimated total slaughterings based on the 1909 and 1919 Census reports.

The supervision of the packers and stockyards agencies during the War finally resulted in the passage of the Packers and Stockyards Act by Congress, which became a law in August, 1921. This act provided for the supervision of public stockyards, live stock market agencies, and dealers in live stock and live stock products, to prevent misleading or illegitimate practices and to encourage fair competition. Some of the operations of the packers and stockyards administration under the direction of the Secretary of Agriculture were severely criticized by several of the large packers from the commencement of the operation of the law, making it necessary to establish legally the constitutionality of the act, and next to secure the right to inspect the books of certain of the packers who refused permission for it.

**International Conditions.** Many changes occurred in the live stock situation in the different countries of the world between 1914 and 1924. The beef industry had developed rapidly in Argentina, New Zealand, Australia, and South Africa. New Zealand and Australia also became the world's largest exporters of lamb and mutton. The development in these countries was rendered possible by the rapid improvements in methods of refrigeration and cold storage of meat products and by the opening of large slaughtering plants. Much of the Australian and New Zealand products was shipped to England and Europe, though considerable New Zealand lamb coming to the United States prior to and after the War met with much favor. The extreme depression in the beef cattle mar-

ket which began in 1921 and continued through 1923 was keenly felt in several of the beef exporting countries. In Argentina where cattle raising for export is the main industry, the situation became so acute in 1923 that the cattlemen organized and were instrumental in having a law passed on October 15 to set a minimum price for beef in the export trade. The fallacy of such a procedure was evident when the law began to operate and the British and American packing companies in Argentina refused to buy cattle. This resulted in a situation more serious than before the law was passed, and in a little more than three weeks the government suspended the operation of the law for six months, and the purchase of meat for export was resumed but at a lower price than one month before. For the relief of similar situations in Australia and South Africa, the respective governments offered bounties on export beef of  $\frac{1}{4}$ d. (\$.005) and  $\frac{1}{2}$ d. (\$.01) per pound. Bounties were also offered for live cattle exported.

Canadian stock raisers were somewhat affected by the United States tariff bills and by the raising of the embargo on Canadian cattle by Great Britain in 1923. Most significant in the meat export trade of the United States was the reaction to the European demand for meat during the War. In 1916 and 1919 the exports of both beef and pork reached the largest amounts in history, although the United States has long been the leading exporter of pork. In 1914 less than 400,000,000 pounds of pork products, exclusive of lard, were exported, but this amount was more than doubled in 1915, with gradual increases in 1916 and 1917, and a large increase in 1918 to nearly 1,750,000,000 pounds. The exports in 1919 were over that figure, but in 1920 they were only about one-half of this amount and gradually declined to a little over 700,000,000 in 1922, with an increase to 900,000,000 in 1923.

The major part of the pork exported consisted of bacon, which was over 1,000,000,000 pounds in both 1918 and 1919. Over 50 per cent of the bacon and about 75 per cent of the ham and shoulder exports were to the United Kingdom. The lard exports were close to 500,000,000 pounds up to 1919, when they reached 750,000,000. This amount was maintained through 1922, but 1923 saw a further increase to over 1,000,000,000 pounds. The exportation of lard to Germany, which was entirely stopped from 1915 to 1918, was resumed in 1919, with gradual increases in the amount exported each year to nearly 377,000,000 pounds in 1923. In 1913 the amounts of lard exported to the United Kingdom and Germany were nearly equal, but this condition did not again exist until 1920, though in the years following, large amounts were shipped to each country. The amount sent to Germany was very heavy, showing an increase about 50 per cent, in 1923.

There was also a remarkable increase in the fresh beef exports of the United States during the decade, from less than 7,000,000 pounds in 1913 to 514,000,000 in 1918, with a gradual decline to 3,000,000 pounds in both 1922 and 1923. Canned beef exports were similarly increased. A major part of the exports of fresh beef and about one-third of the canned beef were to the United Kingdom.

Research. Experimental inquiry indicated a more complete realization of the importance

of fundamental research. Notable advances were made in the physiology of nutrition and knowledge of qualities which influence the value of feeding stuffs. A better understanding of the importance of vitamins, minerals, and the different kinds of proteins in the rations of live stock tended to explain why certain feeds and feed combinations produced unsatisfactory growth or gains. During and succeeding the War the high prices of feeding stuffs made the utilization of fibrous and other low grade feeds desirable, and much work was done, especially in Germany, toward increasing the digestibility of such feeds by hydrolysis. The attainment of results in breeding experiments with the live stock of more economic importance is necessarily a slow process, and the expense of such investigations is often prohibitive. Much progress in breeding has been made through the use of the smaller experimental animals such as the rat and the guinea pig, with sufficient comparisons with larger animals to make it evident that the same fundamental principles of inheritance are operative.

Fundamental investigations of much practical value on the effect of inbreeding in rats and inbreeding and crossbreeding in guinea pigs were carried on at the Wistar Institute and the United States Department of Agriculture, respectively. Both studies indicated that inbreeding tends to increase the percentage of homozygosity of the stock. The latter study dealing with the effect on fertility and vigor showed that such conditions seem to depend mainly on dominant factors and that crossbreeding brings together a greater variety of dominant factors and thus results in increased vigor. The fundamental work in animal breeding has been closely correlated with the results of breeding investigations with the fruit fly, *Drosophila melanogaster*, which species has been better analyzed genetically than any other organism.

Interesting studies of sex determination in animals have indicated that sex is not only due to differences in the sex determining power of chromosomes, but that the sex may also be modified by other factors which tend toward the production of intersexuality in certain cases. R. Goldschmidt in Germany, working with gipsy moths, has carried this analogy further than other investigators, although recent results with goats, chickens, and pigs in Scotland and the United States have partially, at least, corroborated his results. Theoretical studies of growth, senescence, and production in dairy cattle and hens have indicated that the curves of milk production, egg production, and growth and senescence in dairy cattle and senescence in fowls tend to follow the course of a monomolecular chemical reaction. It is thus concluded that these physiological operations are limited by chemical reactions. See VETERINARY MEDICINES.

**LIVONIA.** See BALTIC PROVINCES.

**LLOYD GEORGE, DAVID.** A British statesman and reformer (see VOL. XIV). At the outbreak of the War, as Chancellor of the Exchequer, he took measures which enabled British credit to withstand, with success, the immediate needs brought about by the beginning of the struggle. Early in 1914, he was appointed Minister of Munitions, in which office he displayed remarkable ability for organization and ceaseless energy. Following the death of Earl Kitchener, in 1916, he was appointed

Secretary of State for War. He proposed the limiting of the cabinet to a smaller membership, from which the prime minister was to be excluded. After failure of his attempts to bring this about, he resigned, and as he was supported by the Unionist leaders, Mr. Asquith, Prime Minister, retired, and Lloyd George became Minister and First Lord of the Admiralty. From 1917, to the conclusion of peace, he was practical dictator of government policies. Following the Armistice, he called for a general election, and was returned to power by an immense majority. He was one of the leading figures at the Peace Conference and showed remarkable diplomatic skill. In 1920, he introduced the Home Rule Bill, and largely through his efforts the Irish Free State was established. In 1921, he took an active part in many conferences on the political and social conditions in Europe. His aggressive support of Greece in 1922, and the success of the Turkish armies in that year, brought about his defeat, together with that of the Coalition Cabinet. He was, however, returned to Parliament and remained leader of the Liberal policy in the House of Commons. He visited the United States in 1923. See GREAT BRITAIN, *History*.

**LOANS, INTERNAL AND EXTERNAL.** See FINANCE AND BANKING.

**LOCKWOOD, CHARLES CLAPP** (1877- ). An American lawyer, born in Brooklyn, N. Y. He was graduated from the New York Law School in 1900, and in 1903 was admitted to the bar. He served in the New York Assembly in 1914 and in the State Senate from 1915 to 1922. He was prominent in reform movements in the city and State and was chairman of the Senate Committee to investigate rents, housing and combination in restraint of trade. He was also chairman of the commission to investigate the finances of the City of New York.

**LODGE, HENRY CABOT** (1850- ). An American legislator and historical writer (see VOL. XIV). He was reelected to the Senate in 1916. In the same year he served as chairman of the Committee on Resolutions at the Republican National Convention in Chicago. He was the leader in the Senate in opposition to the Versailles Treaty and the covenant of the League of Nations in the form in which they were presented for ratification. He proposed reservations and amendments which President Wilson refused to accept (see UNITED STATES). He served as temporary and permanent chairman of the Republican National Convention of 1920, and in the same year was chairman of the United States Pilgrim Tercentenary Commission. In the 67th and 68th Congresses, he was chairman of the Committee on Foreign Relations and was the Republican leader of the Senate. He was appointed, by President Harding, delegate and special ambassador to the Conference on the Limitation of Armaments, 1921-22. In 1922, he was again reelected to the Senate, though by a greatly reduced majority. His opposition to several of the important policies advocated by President Coolidge in 1924 caused him to be severely criticized. His later books include *Democracy of the Constitution and Other Essays* (1915); *War Addresses* (1917).

**LODGE, SIR OLIVER JOSEPH** (1851- ). A British philosopher and man of science (see VOL. XIV). In 1919, he was made Albert Medallist of the Royal Society of Arts as a

pioneer in wireless telegraphy. His publications after the War were devoted exclusively to psychical research, a cause which found greater favor in the eyes of the British public than ever before. *Raymond*, published in 1916, purports to reveal communications between Sir Oliver and his son who was killed in the War. *Christopher* (1919) is a study in human personality on the spiritistic hypothesis. In addition to these publications, Sir Oliver was active as an experimenter in psychical phenomena and contributed a number of articles to journals devoted to that cause.

**LOEB, JACQUES** (1859-1924). An American physiologist and experimental biologist (see Vol. XIV). Dr. Loeb's death occurred unexpectedly at Bermuda, where, as was his custom, he had gone to conduct experiments with marine life. During the past decade he had published the following major works: *The Organism as a Whole, from the Physicochemical Viewpoint* (1916); *Forced Movements, Tropisms and Animal Conduct* (1918), and *Proteins and the Theory of Colloidal Behavior* (1922).

**LOEB CLASSICAL LIBRARY.** See PHI-  
 LOLOGY, CLASSICAL.

**LOENING, GROVER C.** (?- ). An American aeronautical engineer born in Bremen, Germany. He was educated in New York. He is best known for his many inventions: the first flying boat; monoplane flying boat, and first American short hull flying boat. At San Diego (1914) he invented the first monoplane rigid bracing pursuit machine. In 1915, he built the Signal Corps tractor used by Lt. B. Q. Jones in establishing the world's three passenger endurance records and by Lt. T. Dodd in the cross country record. He introduced steel construction in the Sturtevant biplane (1916) and the next year began the designing and development of the Loening monoplane and seaplane. In 1922, the Collier Trophy was awarded him for the Loening Air-Yacht. Among his books are: *Monoplanes and Biplanes* (1917); *Military Aëroplanes* (9th ed., 1916-18); *Revival of the Monoplane* and many papers and articles.

**LOGUE, MICHAEL** (1840- ). A Roman Catholic cardinal, born in Donegal, Ireland. He was consecrated Bishop of Rapoe in 1879 and coadjutor, and in 1887 was made Roman Catholic Primate of all Ireland. He was created Archbishop of Armagh in 1888 and Cardinal in 1893. He took an active part in bringing about settlement between the opposing parties in Ireland prior to the formation of the Irish Free State, and his influence was constantly exerted against violence and bloodshed.

**LONDON CONFERENCES.** See REPARATIONS.

**LONDON, TREATY OF** (1915- ). (See FIUME-ADRIATIC CONTROVERSY; ITALY; REPARATIONS; TIROL, GERMAN SOUTH; WORLD WAR, DIPLOMACY OF.

**LONE SCOUTS OF AMERICA.** An organization for boys, incorporated in Washington in 1915. It offers boys the advantages of the Boy Scout Movement without the necessity of joining a group of boys in the same neighborhood. Up to Aug. 1, 1924, 527,353 boys were enrolled. The Lone Scouts, with no adult leadership except that of two officials at the Long House, or national headquarters, who edited and published the official organ, developed complete national organization. Sixteen districts were created, each with a Council Chief and a Council of Ten.

The Council Chiefs constituted a national executive committee. Forty authorized Lone Scout amateur publications were edited and published by Lone Scouts who, in most cases, did the printing themselves. Local, State and National rallies were conducted. On Mar. 1, 1924, the Lone Scouts of America merged with the Boy Scouts of America (q.v.) without losing its separate identity, the national officials of the Boy Scouts of America becoming the national officials of the Lone Scout organization. The *Lone Scout*, the official magazine, was discontinued at the same time, and *Boy's Life*, the Boy Scout magazine, became the official magazine for the Lone Scouts. The Long House is at 500 North Dearborn Street, Chicago.

**LONGFELLOW, ALEXANDER WADSWORTH** (1854- ). An American architect, born at Portland, Me. He was graduated from Harvard in 1886 and studied architecture at the Massachusetts Institute of Technology and at the Ecole des Beaux Arts. He began the practice of his profession in Pittsburgh and Boston in 1887, forming the firm of Longfellow, Alden and Harlow. This firm designed the Carnegie Library at Pittsburgh and the City Hall at Cambridge. In 1895, he formed a partnership with his brother, R. K. Longfellow. He designed Phillips Brooks House and other buildings for Harvard University and several buildings for Radcliffe College. He was the designer of the original Boston elevated railway stations. His memberships included that in the Art Commission of Boston and the Boston Marine Museum. He was a trustee of the Boston Museum of Fine Arts, a Fellow of the American Institute of Architects, and a member of other architectural and patriotic societies.

**LONGLEY, HARRY SHERMAN** (1868- ). An American Protestant Episcopal bishop, born at Cohoes, N. Y. He was graduated from St. Stephen's College in 1891 and from the General Theological Seminary in 1894. He was ordained priest in 1895 and served as rector in churches in Massachusetts, New York and Illinois. In 1912, he was consecrated suffragan Bishop of Iowa. He was elected coadjutor bishop in 1917, and in 1920, became presiding bishop of the Province of the Northwest.

**LONGMAN, (MARY) EVELYN BEATRICE** (1874- ). An American sculptor (see Vol. XIV). Among her awards during the period were the French gold medal from the Art Institute of Chicago, 1920; the Widener gold medal from the Pennsylvania Academy of Fine Arts, 1921; and the Watrous gold medal from the National Academy of Design, 1923. She became a member of the National Academy in 1919.

**LONG RANGE GUNS.** See ARTILLERY.

**LONGWORTH, NICHOLAS** (1890- ). An American public official, born at Cincinnati, Ohio, and educated at Harvard. He was admitted to the bar in 1894, and served in the State Legislature of Ohio from 1899 to 1903. In 1903, he was elected to the United States Congress and was reelected for 10 consecutive terms. He was floor leader of the House of Representatives. In 1906, he married Alice, daughter of Theodore Roosevelt.

**LORD, ROBERT HOWARD** (1885- ). An American educator, born at Plano, Ill. He was graduated from Harvard University in 1906 and took postgraduate courses in Austria, Germany and Russia. He was successively instructor in

history and assistant professor of history at Harvard, occupying the last post from 1916. In 1918-19, he was Harvard Technical Expert on Polish affairs with the American Commission to Negotiate Peace in Paris, and a member of the American Inter-Allied Commission to Poland (1919). He wrote *The Second Partition of Poland* (1915), and, with Professor C. H. Haskins, *Some Problems of the Peace Conference* (1920).

**LORENZ, ADOLF** (1854- ). An Austrian orthopedic surgeon (see VOL. XIV) who has received unusual publicity in the United States and elsewhere, because identified with a successful method of bloodless treatment for a special deformity—congenital dislocation of the hip. At the close of the War, Lorenz removed to the United States, although dividing his practice between the latter and his home city of Vienna. His free orthopedic clinics held in some of the large cities of the United States caused a difference of opinion among the profession of the latter, but the claim of his partisans has been that the public needs education as to what may be accomplished among cripples by orthopedists.

**LORENZEN, ERNEST GUSTAV** (1876- ). An American lawyer and educator, born at Russee-Kiel, Germany. He came to the United States in 1892 and studied law at Cornell University, taking postgraduate studies in France and Germany. After practicing law in New York City from 1901 to 1903, he was appointed professor of law at the University of Maine. In 1904, he became professor of law and in 1910, dean of the Law School at George Washington University. From 1911 to 1914 he was professor of law at the University of Wisconsin, and from 1914 to 1917 at the University of Minnesota. In the latter year, he was appointed to the same chair at Yale. He was the author of several books on legal subjects, and contributed articles to American and European reviews.

**LORING, WILLIAM JOSEPH** (1869- ). An American mining engineer, born in San Mateo County, Cal. He began his career as a boy in a mine in California in 1881 and after successively passing through the stages of milling practice, he became (1894) mill superintendent of the Utica Milling Company. In 1906, he was made general manager of Benick, Moreing and Company's Australasian interests, consisting of 41 mining companies with headquarters in London. Eight years later he returned to California and became president and general manager of six or more gold-mining corporations. He presided over the American Mining Congress in 1921-22.

**LOS ANGELES.** The largest city of California. The population rose from 319,198 in 1910 to 576,673 in 1920, an increase of more than 80 per cent in 10 years, and to 666,853 by estimate of the Bureau of the Census for 1923. During 1922 and 1923, \$6,900,000 was spent by the city on harbor improvement, and Los Angeles became a regular port of call for 61 different freight and passenger liners and five tank liners. Imports increased from \$1,942,647 in 1910 to \$9,897,336 in 1920 and to \$33,555,593 in 1923, while exports climbed even more remarkably from \$135,911 in 1910 to \$18,606,121 in 1920 and to \$29,495,005 in 1923. In 1924, bonds were voted by the city for the following purposes: \$34,600,000 for school sites, buildings and equipment, \$8,000,000 for water

works, \$1,600,000 for police stations and signal system, \$1,000,000 for bridges, \$600,000 for incinerators, and \$400,000 for fire boats; \$35,000,000 additional for flood control was voted by the county. Municipal power houses were built in 1916 and 1919, and an extension in 1923, which all together produced 107,000 horse power of electrical energy. The value of oil refineries rose from \$1,145,812 in 1914 to \$5,613,897 in 1919; the value of petroleum products in 1923 was \$135,271,425. Bank clearings increased from \$1,145,167,110 in 1914 to \$7,024,888,783 in 1923 and to \$3,713,429,255 the first six months of 1924; and building permits from \$21,684,100 in 1910 to \$200,133,181 in 1923, and to \$78,828,738 the first six months of 1924.

A new city charter was adopted in May, 1924. The outstanding characteristics were the enlisting of citizen service on a great number of administrative boards, with boards of expert administrators attached; and the large administrative powers given to responsible executives subject to these citizen boards. The mayor, the city attorney, controller, members of the council and of the board of education were elected by popular vote. Sixteen departments each administered by five paid commissioners were created. Provision was also made for the creation of boroughs within the city, whereby any annexed section not a part of the original central city of 4000 acres, or of 40,000 population, might become a borough by action of the city council and a vote of the residents of the proposed borough territory.

**LOTI, PIERRE (JULIEN VIAUD)** (1850-1923). A French novelist (see VOL. XIV). In 1914, he reentered the service of his country, being appointed to the General Staff of the Armies of the East as inspector of the defense against airplanes. Resulting from his war experiences were numerous articles, published in the following collections: *La Hyène Enragée* (1916); *Quelques Aspects du Vertige Mondial* (1917); *L'Horreur Allemande* (1918); *La Mort de Notre Chère France en Orient* (1920). The last-named book pleads the cause of Turkey. During these latter years he also published several autobiographical works, continuations of his earlier ones: *Prime jeunesse* (1919), *Un Jeune officier pauvre* (1923), and *Suprêmes visions d'Orient* (1922). The two last works were revised and published by his son Samuel. He died at Hendaye and was buried at Saint-Pierre-d'Oléron, the "cradle of his family."

**LOUCHEUR, LOUIS** (1872- ). A French industrialist and politician, born at Roubaix, and educated at the lycée of Lille and at the Ecole Polytechnique in Paris. Graduating as engineer, he was interested in industrial enterprises, but did not come to the fore until the War when he became Minister of Munitions. After the Armistice, he was made minister for the devastated regions. He tried to bring French and German industrialists together on programme of mutual interest, but the plan was for the time being unsuccessful. See REPARATIONS.

**LOUDERBACK, GEORGE DAVIS** (1874- ). An American geologist, born at San Francisco, Cal. He studied at the university of California and received his Ph.D. there in 1900. He became professor of geology at the University of Nevada in 1903. In 1906, he returned to California, where during 1917-1920 he was professor of geology and in 1920, dean of the college of

letters and science. During 1914-15 he was consulting engineer of the Standard Oil Geological Expedition to China and in 1918-19 he held consulting relations with the United States Bureau of Mines and the United States Geological Survey. During the War he was a member of the Pacific Coast committee on geology of the National Research Council. Dr. Louderback made a specialty of the basin range structure and West Coast stratigraphy and was the discoverer of several new minerals, including benitoite. He was president of the Seismological Society of America in 1914.

**LOUIS III, LEOPOLD JOSEF MARIA ALOYS ALFRED**, last KING OF BAVARIA (1845- ). (See VOL. XIV.) He was forced to abdicate in November, 1918, when the people of Bavaria inaugurated the Bavarian Free State.

**LOUISIANA.** Louisiana is the thirtieth State in size (48,506 square miles), and the 22d in population; capital, Baton Rouge. The population increased from 1,656,388 in 1910 to 1,798,509 in 1920, a gain of 8.6 per cent. The white population increased from 941,086 to 1,096,611, the native white increasing from 889,304 to 1,051,740, while the foreign-born white decreased from 51,782 to 44,871. The number of negroes fell from 713,874 in 1910 to 700,257 in 1920. Both urban and rural populations increased: the former from 496,516 to 628,163; the latter from 1,159,872 to 1,170,346. The growth of the principal cities was as follows: New Orleans (q.v.), 339,075 (1910), 387,219 (1920); Shreveport, 28,015 to 43,874; Baton Rouge, 14,897 to 21,782.

**Agriculture.** Agricultural conditions in Louisiana in the decade 1910-20 were affected, as in the case of the other southern States, by the ravages of the boll weevil, which became serious about 1905. The effect is apparent in the following comparison of the acreage and production of cotton for various years during the period. In 1904, the acreage was 1,745,865 and the production 1,089,526 bales; in 1908, 1,550,000 and 470,136 bales; in 1913, 1,244,000 and 440,000 bales; in 1917, 1,454,000 and 639,000 bales; in 1919, 1,527,000 and 298,000 bales; in 1921, 1,168,000 and 279,000 bales; and in 1922, 1,185,000, and 357,000 bales. The estimated production in 1923 was 340,000 bales. In addition to the devastations of the boll weevil, army worms in many sections of the State stripped the leaves of the cotton plant. Damage in 1923 from the boll weevil and leafworm was heavier than in 1922. See **BOLL WEEVIL** and **COTTON**.

While the population of the State increased 8.6 per cent in the decade 1910-20, the number of farms increased 12.4 per cent (from 120,546 to 135,463). In 1910, the acreage of land in farms was 10,439,481; in 1920, it had decreased to 10,019,822, or 4 per cent. The improved land in farms, however, increased from 5,276,016 to 5,626,226 acres, or 6.6 per cent. The total value of farm property showed an apparent increase, from \$301,220,988 in 1910 to \$589,826,679 in 1920; the average value per farm, from \$2499 to \$4354. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of currency in the latter part of that period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of

land used for agricultural purposes decreased from 35.9 in 1910 to 34.5 in 1920; the percentage of improved land rose from 50.5 to 56.2. In 1920, of the total of 135,463 farms, 57,254 were operated by owners, 828 by managers, 77,381 by tenants. The comparative figures for 1910 were 52,989, 950, and 66,607. White farmers in 1920 numbered 73,404, compared with 65,667 in 1910; the native white farmers, 71,081, compared with 63,236; Negro farmers, 62,036 compared with 54,819. The 1.9 per cent decrease in Negro population, 1910-20, in contrast with the increase of 9.7 per cent in the preceding decade, quite seriously affected the farm labor situation. The farms free from mortgage in 1920 numbered 36,010, compared with 42,011 in 1910. Those mortgaged numbered 11,783 compared with 9834. The number of dairy cows in 1920 was 217,690, compared with 279,097 in 1910, a decrease of 22 per cent; "beef cows," 316,518, compared with 183,550. The number of swine declined from 1,368,000 in 1910 to 911,600 in 1920. Mules, in 1920, numbered 180,115, compared with 130,928 in 1910; sheep, 129,816 compared with 139,308. The estimated production of the chief farm crops in 1923 was as follows: corn, 26,545,000 bushels; oats, 1,194,000 bushels; potatoes, 1,638,000 bushels; sweet potatoes, 6,802,000 bushels; tobacco, 459,000 pounds; rice, 15,896,000 bushels; peanuts, 9,132,000 bushels. Comparative figures for 1913 are: corn, 41,800,000 bushels; oats, 990,000; rice, 11,760,000; potatoes, 1,750,000; hay, 240,000 tons; tobacco, 270,000 pounds; and cotton, 444,000 bales. Louisiana is the most important cane-sugar producing State. The area planted to sugar cane in 1922 was 217,000 acres, and the crop of cane was 3,342,000 short tons, producing 241,376 short tons of sugar and 20,420,000 gallons of molasses. While the area and production show some fluctuation during the decade, they were practically the same in 1922 as in 1914.

**Mining.** Louisiana is an important producer of minerals, especially of petroleum, sulphur and natural gas. There is no metal mining in the State. The petroleum industry is most important. Its progress during the decade 1914-24 is indicated by the following comparative figures: in 1914, there were produced 14,309,435 barrels, valued at \$12,886,897; 1915, 18,191,539, \$10,804,653; 1916, 15,248,138, \$14,669,774; 1917, 11,392,201, \$17,224,602; 1918, 16,042,600, \$27,535,060; 1920, 35,714,000, \$112,606,000; 1921, 27,103,000, \$42,469,000; and 1922, 35,376,000. The increased production in the last three years indicates the discovery and development of new oil fields. In production of sulphur, Louisiana heads the list of States. Production figures for the period under review are as follows: 1914, 374,470 tons; 1917, 595,130; 1918, 918,700; 1919, 526,250; 1920, 37,635; 1921, 795,980; and 1922, 1,146,860. The production of natural gas is also of great importance, as indicated by the following figures: 1915, 25,540,392 M. cubic feet; 1918, 36,094,132; 1920, 58,274,000; 1921, 58,004,000. The output of natural gas gasoline has increased steadily, rising from 2,113,159 gallons in 1916, to 7,020,538 gallons in 1918; 10,609,629 gallons in 1920; and 15,340,374 gallons in 1921. In addition to the minerals mentioned above, the State produces clay products, salt, and sand and gravel. The total value of the mineral products in 1921 was \$61,061,974, compared with \$138,745,725 in

1920; \$38,851,509 in 1919, \$54,769,225 in 1918, and \$21,890,025 in 1914.

**Manufactures.** While Louisiana is not one of the chief manufacturing States, its industrial progress, since 1909, has been great. The six cities in the State with a population of more than 10,000, in 1919 contained 27.6 per cent of the total population and produced 32 per cent of the total value of the manufactured products. In 1909, there were in the State 2516 manufacturing establishments; 2211 in 1914, and 2617 in 1919. Persons engaged in manufacture numbered 86,563, 88,014, and 112,523; and capital invested amounted to \$221,816,398, \$261,635,022, and \$462,209,056 in these years. The value of the products in 1909 amounted to \$233,948,638; in 1914, \$255,312,648; and in 1919, \$676,189,770. The increase in value of the products was due largely to changes in industrial conditions brought about by the War, and therefore cannot be properly used to measure the growth of manufactures during the census period of 1914-19; but the increase shown in number of establishments and number of wage earners clearly indicates a growth in the State's manufacturing activities. The first industry in importance in point of value of products is the refining of sugar. This, in 1909, amounted to \$63,775,000; in 1914, to \$57,948,000, and in 1919, to \$141,843,000. The manufacture of lumber and timber products ranks second; in 1909, such products were valued at \$62,838,000; in 1914, at \$66,656,000, and in 1919, at \$130,521,000. Since 1914, when there were 21 refineries, the refining of petroleum has become one of the great industries of the State. The value of the product in 1919 was \$75,023,726. The manufacture of cotton-seed oil and cake takes fourth place in point of value: in 1909, \$13,085,000; in 1914, \$18,016,000, and in 1919, \$57,162,000. The chief manufacturing cities are New Orleans (q.v.), Shreveport, and Lake Charles. In 1909, there were in New Orleans 848 manufacturing establishments, with a product valued at \$78,794,000; 733 in 1914, with a product of \$69,814,000, and 873 in 1919, with a product of \$182,799,000.

**Education.** Educational progress in the decade 1914-24 was steady in Louisiana. The Legislature of 1914 passed, among other important measures, a compulsory education law affecting all cities of over 25,000 inhabitants. In 1916, measures were passed authorizing the acceptance of the terms and provisions of the Smith-Hughes bill providing for vocational education. The State colony and training school for feeble-minded was created in 1918. In 1920, parish school boards were authorized to create school districts at any time. The Legislature of 1922 passed an act providing for a State Board of Education and parish school boards, defining their powers and providing for the administration and supervision of the public schools of the State; the board to include 11 members, three appointed by the governor, and eight elected for terms of eight years. In the same year an inclusive compulsory attendance measure was passed, providing for the attendance in school of every child in the State between the ages of 7 and 14; and the Legislature also provided for the promotion of vocational rehabilitation. In 1914 the total enrollment in the schools was 288,972, including both white and colored pupils; in 1921-22, the number enrolled had increased to 390,324; of whom 257,-

727 were white and 132,597 were colored; the total enrollment in the elementary white schools was 225,167; and in the secondary white, 32,560. The attendance in the State-approved high schools for white children was 23,433. The total expenditure for current expenses in 1921-22 was \$12,586,110, and the total outlay for all educational purposes was \$25,204,675. The percentage of illiteracy in the State decreased from 31.1 in 1910 to 24.9 in 1920: among the native white, from 16.8 per cent to 13.5; among the foreign-born white, from 23.2 to 22.6; among the colored, from 52.2 to 43.8 per cent.

**Finance.** See STATE FINANCES.

**Political and Other Events.** There was much friction in the political history of the State in the decade 1914-24, especially in the latter part, due to the activities of the Ku Klux Klan and attempts to control and regulate members of this body by the Governor and other State authorities. In 1914 elections were held for representatives in Congress only. The Democrats were successful in all districts, except one, where a Progressive candidate was elected. In 1915 over \$4,500,000 was expended in New Orleans in an effort to rid the city of rats in order to prevent the reappearance of the bubonic plague. Elections were held in 1916 for governor and other State officers. R. G. Pleasant, Democratic candidate, was elected. In the presidential voting in this year, President Wilson received 79,875 votes; Charles E. Hughes, 6466. In 1920 elections were held for United States senator, and E. S. Broussard, Democratic candidate, was elected. In the presidential voting of this year, J. M. Cox received 87,354 votes; W. G. Harding, 38,538. On Dec. 21, 1922, the bodies of two men were found in a lake in Morehouse parish. It was alleged that these men had been flogged by members of the Ku Klux Klan and their bodies thrown into the lake. Many persons were arrested, but on March 15, owing to lack of evidence, the grand jury failed to bring indictments against them. On April 18, 1923, the district attorney of Morehouse parish lodged 30 informations against prominent citizens for the alleged participation in the murder of the two men, and on November 5, four members of the Ku Klux Klan were found guilty of "carrying firearms on the premises of another," in connection with the activities of the Klan in Morehouse parish. Elections for representative in Congress were held in April, 1924. Genevieve Clark Thompson, daughter of the late Champ Clark, was a candidate for nomination, but was defeated by J. Zach Spearing, of New Orleans, who was elected. In May, 1924, J. M. Fuqua was inaugurated governor of the State.

**Legislation.** Among the important acts of the Legislature in the decade 1914-24 are those noted below. In 1916 a State Board of Education was created. In 1918 the Legislature ratified a prohibition amendment and the Federal woman suffrage amendment. Cities were authorized to adopt the commission form of government when their population exceeded 5000. Laws were passed regulating the sale of narcotics, and the child labor laws were also amended. A law requiring instruction in the common schools to be conducted only in the English language was enacted. The Legislature of 1924 enacted a measure prohibiting the wearing of masks by members of secret societies.

**LOUISVILLE.** The largest city of Kentucky

and the second most populous south of the Ohio and the Potomac Rivers. The population rose from 223,928 in 1910 to 258,500 in 1924, by estimate of the Bureau of the Census. The incorporated area of the city was increased to 25,101 acres by the annexation of Highland Park and Oakdale in 1922. The cities of New Albany, Ind., and Jeffersonville, Ind., with an additional population of 42,000, are immediately across the Ohio River. The assessed valuation of the city increased from \$207,000,000 in 1914 to \$500,000,000 in 1924. In point of value of manufactured products, the city is shown by the Census Bureau to be the most important industrial centre in the South. The value of its manufactured products increased from \$105,223,000 in 1914 to \$204,566,000 in 1919, according to the Census Bureau, and the Louisville Industrial Foundation estimated the value of the city's industrial output at \$311,427,908 in 1923. Bank clearings increased from \$715,731,000 in 1913 to \$1,551,638,237 in 1923. The city is supplied with transportation service by nine trunk-line steam railways, eight inter-urban electric railways, and the Ohio River.

**LOUVAIN LIBRARY.** A famous institution connected with the University of Louvain in Belgium. In the German invasion of 1914, the university together with its library, which contained 120,000 volumes and 250 incunabula, was ruthlessly destroyed. When Cardinal Mercier, its head, visited the United States in 1919, he was asked of what particular aid Americans could be in the work of Belgian reconstruction; he suggested that the schools, colleges, and universities of the younger and larger country should join in the restoration or rather rebuilding of this monument of the smaller and older land. Under the terms of the Versailles Treaty, a large number of volumes were sent into Belgium from Germany to replace those destroyed. Whitney Warren was the architect of the new building, planned for completion in August, 1925, at a cost of \$1,000,000. For its opening and for the celebration of the five hundredth year since the founding of the university and the eleventh from its destruction, ceremonies were projected which were to be attended by representatives of important institutions of learning of the world. Each of these was to leave its shield or other insignia in the library as a permanent memorial. The war records of the donors of funds were also to be engraved on the columns, keystones, and other parts of the structure.

**LOVEJOY, ARTHUR ONCKEN** (1873- ). An American philosopher (see VOL. XIV). In 1920, he collaborated with a group of other American philosophers in the publication of *Essays on Critical Realism*. The common ground of the authors is the distinction between essence and existence, which is not usually stressed by the so-called naïve realists. During the War, Professor Lovejoy was an active propagandist for liberal ideals. He collaborated with Prof. Albert Bushnell Hart in the publication of a *Handbook for the War for Public Speakers* (1917).

**LOVETT, ROBERT MORSE** (1870- ). An American editor and educator, born in Boston, Mass. He was graduated from Harvard in 1892 and in the same year was assistant in English at that university. He served as assistant professor of English from 1894 to 1904; associate professor from 1904 to 1909,

and from 1909 as full professor at the University of Chicago. From 1903 to 1920, he was dean in the junior college. He was a member of the National Institute of Arts and Letters and was the author of *The History of English Literature*, with W. V. Moody (1902); *Richard Gresham*, a novel (1904); *The First View of English Literature*, with W. V. Moody (1905); *A Winged Victory*, a novel, (1907); *Cowards*, a play (1914). He served as editor of the *Dial* in 1917 and joined the editorial board of the *New Republic* in 1921.

**LOVETT, ROBERT SCOTT** (1860- ). An American railway president (see VOL. XIV). During the War he filled important positions in the management of railroads, and was chosen president (1919) and chairman of the Board of Directors (1920) of the Union Pacific System.

**LOWDEN, FRANK ORREN** (1861- ). An American public official, born in Sunrise City, Minn. He was graduated from the Iowa State University in 1885 and studied law at the Union College of Law in Chicago. He began practice in that city in 1887, continuing until 1906. He took an active part in politics and was a member of the Republican National Committee, from 1904 to 1912. In 1906, he was elected member of Congress and was twice re-elected. In 1917, he was elected Governor of Illinois, serving until 1924. He was one of the prominent candidates of the Republican National Convention in 1920, and in 1924 refused the nomination for Vice President.

**LOWELL.** A manufacturing city of Massachusetts. The population rose from 106,294 in 1910 to 112,759 in 1920 and to 115,089 by estimate of the Bureau of the Census for 1923. A memorial auditorium costing \$1,000,000 was erected in 1921 in memory of the Lowell men and women who took part in the wars in which the United States has been engaged. In the same year, after 10 years of the commission form of government, the city changed back to the mayor and council form. A \$2,000,000 high school was completed in 1922. The assessed valuation of the city increased from \$87,277,643 in 1913 to \$136,492,851 in 1923. In 1924, there were over 300 manufacturing establishments in the city employing 35,000 persons and paying \$35,000,000 annually in wages.

**LOWELL, AMY** (1874- ). An American poet and critic, born at Brookline, Mass., and educated in private schools. In 1917-18 she gave lecture courses at the Brooklyn Institute of Arts and Sciences; in 1921 she was the Francis Bergen Foundation Lecturer at Yale and Marshall Woods lecturer at Brown University. As a champion of free verse as well as one of its foremost writers, her influence in this movement in the United States was of great importance. (See LITERATURE, ENGLISH AND AMERICAN.) Her published works during the decade 1914-24 were *Sword Blades and Poppy Seed* (1914); *Six French Poets* (1915); *Men, Women, and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921); *Fir-flower Tablets—Poems Translated from the Chinese*, with Florence Ayscough (1921); and *A Critical Fable* (1922).

**LOWELL, GUY** (1870- ). An American architect (see VOL. XIV). His design for a new municipal court house in New York was accepted in 1919. From 1917 to 1919, he was

director of the Department of Military Affairs for the American Red Cross in Italy and received several decorations for efficiency and valor from the Italian government. He was the author of various books on architecture.

**LOWES, JOHN LIVINGSTON** (1867- ). An American educator, born at Decatur, Ind. He was graduated from Washington and Jefferson College in 1888 and took postgraduate courses in Germany and at Harvard University. After serving on the faculties of several colleges, he was appointed, in 1909, professor of English at Washington University, St. Louis, serving until 1918. In 1913-14, he was dean of the college, and in 1918 became professor of English at Harvard University. He was Lowell Institute lecturer in 1919 and was the author of *Convention and Revolt in Poetry* (1919). He edited, both alone and with others, several texts on Shakespeare and others.

**LOWIE, ROBERT HENRY** (1883- ). An American anthropologist (see VOL. XIV). His principal works include: *Societies of the Arikara Indians* (1914); *Dances and Societies of the Plains Shoshones* (1915); *Notes on the Social Organization and Customs of the Mandan, Hidatsa and Crow Indians* (1917); *Culture and Ethnology* (1917); *Plains Indian Age Societies* (1917); *Myths and Traditions of the Crow Indians* (1918); *The Matrilineal Complex* (1919); *Primitive Society* (1919); *The Religion of the Crow Indian* (1922); *The Material Culture of the Crow Indians* (1922); *Crow Indian Art* (1922); *Psychology and Anthropology of Races* (1923).

**LUBIN, DAVID** (1840-1919). American agricultural specialist and merchant. He was for many years in business at Sacramento, Cal., but interested himself in improving the system of marketing agricultural products, promotion of complete and systematic statistical information, and development of rural credits, national marketing, etc. He succeeded in bringing before Congress a proposal for an international convention for the establishment of an International Commerce Commission on merchant marine (the measure passed Sept. 1, 1914); and he also secured the introduction of a measure for improving the Parcel Post service, facilitating direct dealing between producers and consumers (1916). His proposals for the International Institute of Agriculture were embodied in that institution, which has since supplied world crop, import and export reports, etc., and to which he was the American delegate. Mr. Lubin died at Rome, Italy, Jan. 1, 1919. See AGRICULTURE, INTERNATIONAL INSTITUTE OF.

**LUCIFERINE, LUCIFEROSE.** See PHYSICS.

**LUDENDORFF, ERICH** (1865- ). A Prussian general, born at Kruszevnia, near Posen. He worked out the last great German Army Bill passed by the Reichstag in 1913. All his proposals were adopted with the exception of that concerning three new army corps. On the outbreak of the War he was first sent to the western front, where he took the citadel at Liège. On Aug. 22, 1914, he was sent to the eastern front as chief of the General Staff and shared with Hindenburg the credit of the great victories at Tannenberg and the Masurian Lakes. During the progress of the War his advance was rapid and constant. He organized

the great German offensive of the spring and summer of 1918 whose final collapse led to the German defeat.

**LUDWIG, EMIL** (1881- ). A German writer. He was born at Breslau and studied at the university of that city. He wrote verse and prose, fiction, drama, essays and biography. His plays include: *Napoleon* (1906); *Der Spiegel von Shalott* (1907); *Trilogie der Renaissance* (1904-20); *Atalante, Ariadne* (1914); *Friedrich von Preussen* (1914). His novels are: *Manfred und Helene* (1911); *Diana* (1918); *Meeresstille und Glückliche Fahrt* (1920). He is also the author of the essays, *Der Künstler*; of the lyric volume, *Römische Sonette* (1921); of a life of Wagner (1913), and is most highly esteemed for his *Goethe, Geschichte eines Menschen* (1920).

**LUMBER.** See FORESTRY.

**LUMEN.** See ELECTRIC LIGHTING.

**LUMINESCENCE IN ANIMALS.** See ZOÖLOGY, *Physiology*.

**LUSITANIA, SINKING OF.** See BLOCKADE, ALLIED; and WAR, DIPLOMACY OF THE.

**LUTHERANS.** The third largest Protestant church in the United States, established officially in America in 1648, historic records showing Lutherans in America as early as 1562. The congregations, the central units and seat of final authority, were organized in synods or general bodies. The Lutherans of the United States and Canada accept the Canonical Scriptures of the Old and New Testaments as the inspired Word of God and as the only infallible rule and standard of faith and practice. They accept and confess the three ecumenical creeds, namely, the Apostles, the Nicene, and the Athanasian. They accept and hold the Unaltered Augsburg Confession as the correct exhibition of the faith and doctrine of the Evangelical Lutheran Church, founded upon the Word of God. All accept and use Luther's Small Catechism. None reject any of the other Symbolical Books of the Evangelical Lutheran Church, namely, the Apology of the Augsburg Confession, the Smalcald Articles, the Large and Small Catechisms of Luther, and the Formula of Concord. Many accept all of these.

The following statistical table shows the totals of the parochial reports made in the years 1914 and 1924:

|                               | 1914         | 1924         |
|-------------------------------|--------------|--------------|
| Congregations . . . . .       | 14,371       | 15,426       |
| Ministers . . . . .           | 9,407        | 10,365       |
| Baptized Members . . . . .    | 3,684,315    | 3,801,235    |
| Confirmed Members . . . . .   | 2,370,656    | 2,539,939    |
| Congregational Expenses . . . | \$10,275,269 | \$30,258,002 |
| Benevolent Contributions . .  | 3,214,644    | 9,402,105    |
| Total Expenditures . . . . .  | 13,489,913   | 39,660,107   |
| Total Valuation of Property . | 99,019,621   | 203,234,636  |
| Sunday Schools—Number . . .   | 5,923        | 10,581       |
| Officers and Teachers . . . . | 76,112       | 101,110      |
| Scholars . . . . .            | 927,737      | 1,058,075    |

During the period, 12 foreign mission societies carried on work in more than 15 countries. After the War, many mission fields formerly supported by the Lutherans of Germany were aided through the National Lutheran Council.

The outstanding events of the decade among the Lutherans of the United States and Canada were: the celebration in 1917 of the 400th anniversary of Luther's posting of the Ninety-Five Theses; the formation of the Norwegian Lutheran Church of America by the merging of

three Lutheran organizations in 1917; the formation by the merging of several other bodies in 1918 of the United Lutheran Church in America, which included in its membership more than one-third of all the Lutherans in the United States and Canada; and the formation of the Evangelical Lutheran Joint Synod of Wisconsin and Other States; the appearance in 1917 of the *Lutheran Common Service Book*; the organization in the same year of the National Lutheran Commission for Soldiers' and Sailors' Welfare, which was supported by the various general bodies and churches; and the organization in 1918 of the National Lutheran Council, an agency for two-thirds of the Lutherans of the United States and Canada for carrying on the regular work of representation, statistics, reference, and publicity, and also emergency relief work. This latter agency gave at least \$6,500,000, including more than \$2,800,000 in the form of clothing, and over \$3,700,000 in the form of cash, for the relief of Lutherans in Europe.

Among the celebrations of the 10 years were: the 400th anniversaries of Luther's appearance before the Diet of Worms, of the appearance of Luther's translation of the New Testament, and of the introduction of congregational singing and the development of hymnology under the influence of the Reformation; and the anniversaries, 175th, 100th, 75th, and 50th respectively, of the Pennsylvania Ministerium, the Maryland Synod, the Missouri Synod, and the Synodical Conference. The Muhlenberg Building was dedicated in 1924 by the United Lutheran Publication House. Led by the veteran Dr. George U. Wenner, the Lutherans reemphasized religious education, especially promoting the idea of week-day religious instruction after school hours. Tens of millions of dollars were subscribed for endowments of Lutheran educational institutions, and millions of dollars to the Ministerial Relief and Pension Funds.

The Lutherans of America took part in the first Lutheran World Convention held at Eisenach, Germany, Aug. 19 to 26, 1923. There were 160 delegates and representatives from 22 or more nations of Europe, Asia, North America, and Australia. With the exception of the Synodical Conference of North America, with about 1,000,000 members, they represented the Lutherans of the world, or about 80,000,000 members. Carefully prepared papers including doctrinal and practical themes of fundamental importance were presented, followed by free discussions. The Rt. Rev. Ludwig Ihmels, D.D., Bishop of Saxony, was made chairman of the Convention. The following doctrinal statement was unanimously adopted: "The Lutheran World Convention acknowledges the Holy Scriptures of the Old and New Testaments as the only source and the infallible norm of all Church teaching and practice; and sees in the Lutheran Confessions, especially the Unaltered Augsburg Confession and Luther's Small Catechism, a pure exposition of the Word of God."

**LUXEMBURG.** This Grand Duchy, bounded by Germany, Belgium and France, has an area of 999 square miles and population of 263,824 (1916). The population in 1910 was 259,899. The capital, Luxembourg, had 45,986 inhabitants in 1921, as compared with 20,848 in 1910. The activities of the population were equally divided between agriculture and industry. The principal crops were oats and potatoes,

while the vine was cultivated in the Moselle Valley region. The economic wealth of the country was, however, centred in its iron fields which continued to average an annual yield of 7,000,000 tons. The iron ore was employed in the manufacture of pig iron and steel by local works. In 1912, the production of pig iron was 2,252,229 tons; in 1918 it was only 1,226,671 tons; but after the War it recovered, reaching 3,704,390 tons in 1920. The production of steel continued steadily to lose ground; 1,296,407 tons were produced in 1916; by 1920, only 692,935 tons.

Although in accordance with the Treaty of London (1867) Luxembourg, like Belgium, was permanently neutralized, and its integrity and independence guaranteed, nevertheless, like Belgium again, the grand duchy was invaded by German troops, Aug. 2, 1914, and occupied throughout the War. No attempt was made to interfere with civil affairs after 1915, but the German hand was felt in the check on the dissemination of opinion through a censorship on posts, wires, etc. A cabinet crisis was precipitated in 1915 and affairs were at a deadlock until the formation of a Catholic-Socialist-Liberal coalition government in February, 1916. The conclusion of the War saw the appearance of a new independent spirit in the population. Agitation in particular was aimed at the severance of the economic union with Germany, in existence since 1842, as well as for the erection of a more liberal frame of government. The result was the abdication of the Grand Duchess Marie Adelaide on Jan. 12, 1919, the ascension to the throne of the Princess Charlotte, and the holding of a plebiscite in September for the determination of the political and economic status of the country. The vote on the former indicated that the Luxemburgers preferred the continuance of the ruling dynasty to a republic; on the question of a new economic union, 60,133 votes were cast in favor of alliance with France against 22,242 in favor of a Belgian alliance. In 1921, however, France yielded up her rights to Belgium with the result that a treaty, completed on July 25, 1921, effected an agreement between Belgium and Luxembourg by which the two agreed to level their customs barriers for 50 years. Belgian currency was introduced into Luxembourg and the Belgians consented to float a loan of 175,000,000 francs for the retirement of German marks then in circulation. The agreement went into effect May 1, 1922.

**LUXEMBURG, Rosa** (1870-1919). A German-Jewish Socialist and revolutionary agitator, born in Poland. She became a socialist in her student days. She entered Germany in 1895. In order to obtain German nationality she went through a form of marriage with a German workman named Luxemburg. After employment on various socialist newspapers, she went to Poland to aid the Russian revolutionary movement there in 1905 but soon returned to Germany and engaged in extreme communistic propaganda. With Karl Liebknecht she founded the Spartacus League. In 1914 at outbreak of the War she was sentenced to a year's imprisonment for inciting insubordination. Throughout the War she remained in preventive custody. When set at liberty again she instigated street fighting in Berlin. Liebknecht was shot while being conveyed to prison. Rosa Luxemburg was brutally beaten by a mob and shot to death.

**LUXURY TAXES.** See TAXATION IN THE UNITED STATES.

**LVOV, GEORGE EUGENIEVITCH, PRINCE** (1861- ). A Russian statesman. He studied law and took his degree in 1885. He was the owner of great estates and devoted much of his time to the organization and development of the Zemstvos, or agricultural coöperative societies. In 1905, he was elected a member of the first Duma. He joined the right wing of the Constitutional Democratic party. During the Russo-Japanese War, he was active in organizing relief among the Zemstvos, and also carried on this work with great efficiency during the great War. In 1917, at the outbreak of the Russian Revolution, he was chosen premier and minister of the interior in the provisional government. Later he became leader of the cabinet in the coalition government, but he showed a lack of administrative ability and retired. Following the accession to power of the Bolsheviks, he was arrested but escaped and finally settled in Paris, where he was one of the leaders of the anti-Bolshevist movement.

**LYAUTEY, LOUIS HUBERT GONZAGE** (1854- ). A French soldier, administrator and writer (see VOL. XIV). In 1912, he was appointed resident minister in Morocco, holding also the office of minister of foreign affairs. He administered this office with great efficiency and was successful in promoting the agriculture and trade of the colony. In 1916-17, he served for a short time as war minister in the cabinet of Briand, but in 1917 was reappointed to Morocco. He was made a marshal of France in 1920. He was a well-known writer and a member of the French Academy.

**LYDSTON, GEORGE FRANK** (1858-1923). An American surgeon and publicist born at Tuolumne, Cal., and educated in medicine in the New York University (M.D. 1879). After several years in New York, he settled in Chicago and was appointed professor of genito-urinary surgery and venereal diseases under the medical department of Illinois University. He was the first to write at length on the subject of sex gland-grafting in the male, an operation which is said to have been tested on his own person. His major writings comprise *Lectures on Syphilis* (1885); *Addresses and Essays* (1892); *Stricture of the Urethra* (1893); *Gonorrhea and Urethritis* (1892); *Surgical Diseases of the Genito-urinary Tract* (1899-1904); *The Diseases of Society* (1904); *Sex Hygiene for the Male* (1912); *Implantation of the Sex Glands* (1914); *Impotence and Sterility* (1917). Lydston engaged in a long controversy with the American Medical Association in respect to some of its policies.

**LYMAN, EUGENE WILLIAM** (1872- ). An American theologian, born at Cummington, Mass. He was graduated from Amherst College in 1894 and took postgraduate courses at Yale and in Germany. After teaching in several schools, he was appointed professor of philosophy at Carleton College, Minn., in 1901, and was professor of theology at the Congregational College of Canada, Montreal, in 1904-05. From 1904 to 1913, he was a member of the faculty of Bangor Theological Seminary, and from 1913 to 1918, professor of the philosophy of religion and Christian ethics at Oberlin College. In 1918, he became professor of the philosophy of religion at the Union Theological Seminary in New York. He wrote *Theology and Human Problems* (1910); *God of the New Age* (1918); *Experience of God in Modern Life* (1918).

**LYMAN, THEODORE** (1874- ). An American physicist, born at Boston, Mass. He was graduated from Harvard in 1897, where he also received his Ph.D. in 1900. He became an assistant in physics at Harvard, where he remained, becoming full professor in 1917, and where he was also director of the Jefferson Physical Laboratory (1908-17). Dr. Lyman made important studies on phenomena connected with diffraction gratings, on the wave lengths of extreme ultraviolet light discovered by Schumann and also on the properties of light of extremely short wave length, on all of which he contributed valuable papers to the literature of physics in the proceedings of scientific societies. During the War he served in France with the American Expeditionary Forces, holding the rank of major of engineers.

**LYNCHINGS.** According to the Department of Records and Research of the Tuskegee Institute, there was a total of 573 lynchings in the United States in the decade 1914-24. Of the victims, 56 were whites and 517 were Negroes. The number of lynchings by years and the alleged causes for which the 573 persons were summarily put to death are shown in the accompanying tables.

NUMBER OF LYNCHINGS

| Year       | Whites | Negroes | Total |
|------------|--------|---------|-------|
| 1914.....  | 3      | 49      | 52    |
| 1915.....  | 13     | 54      | 67    |
| 1916.....  | 4      | 50      | 54    |
| 1917.....  | 2      | 36      | 38    |
| 1918.....  | 4      | 60      | 64    |
| 1919.....  | 7      | 76      | 83    |
| 1920.....  | 8      | 53      | 61    |
| 1921.....  | 5      | 59      | 64    |
| 1922.....  | 6      | 51      | 57    |
| 1923.....  | 4      | 29      | 33    |
| Total..... | 56     | 517     | 573   |

ALLEGED CAUSES FOR LYNCHING

| Year       | Homicide | Felonious Assault | Rape | Attempted Rape | Robbery and Theft | Insults to Women | All Other Causes |
|------------|----------|-------------------|------|----------------|-------------------|------------------|------------------|
| 1914.....  | 30       | 8                 | 6    | 1              | 1                 | —                | 6                |
| 1915.....  | 26       | 10                | 11   | —              | 9                 | 3                | 8                |
| 1916.....  | 20       | 7                 | 3    | 9              | 8                 | 2                | 5                |
| 1917.....  | 6        | 2                 | 7    | 5              | 2                 | 2                | 14               |
| 1918.....  | 28       | 2                 | 10   | 6              | 2                 | —                | 16               |
| 1919.....  | 28       | 3                 | 9    | 10             | 1                 | 6                | 26               |
| 1920.....  | 22       | 9                 | 15   | 3              | —                 | 3                | 9                |
| 1921.....  | 19       | 7                 | 16   | 3              | —                 | 3                | 16               |
| 1922.....  | 15       | 5                 | 14   | 5              | 4                 | 1                | 13               |
| 1923.....  | 5        | 4                 | 6    | 1              | 1                 | 1                | 15               |
| Total..... | 199      | 57                | 97   | 43             | 28                | 21               | 128              |

The decade 1914-24 was notable for (1) a growing sentiment against lynchings and (2) a large decrease in the number of lynchings. The growing sentiment against lynchings manifested itself in (a) the attitude of the press of the country, particularly the editorial policy of the leading newspapers, in speaking strongly against it; (b) expressions of religious denominations, particularly through the Federal Council of Churches; (c) expressions of organizations of white women of the South; (d) agitation for the enactment of laws against lynchings; and (e) the passing of laws by a number of States for the suppression of lynching. The agitation for suppressive legislation had its strongest expression in the effort to have a Federal anti-lynching law enacted. This effort extended over the entire decade. In 1920, an antilynching measure, later known as the Dyer Antilynching Bill, was jointly introduced in the House and Senate of the United States Congress. The press of the South strongly opposed the bill on the ground that it was an invasion of States' rights; and a Democratic filibuster in the House of Representatives in 1921 prevented its coming to a vote. On Jan. 26, 1922, however, the House passed the bill by a vote of 230 to 119. When the measure reached the Senate the question of its constitutionality was brought forward. On July 28, 1922, the Senate Judiciary Committee ruled that it was constitutional. A well-organized filibuster by the Democratic members of the Senate prevented it, however, from coming to a vote and on Dec. 2, 1922, the Republican caucus agreed to drop the measure and not to call it up again during that session of Congress. With the defeat of the Dyer Antilynching bill, newspapers and women's organizations of the South urged that it was now up to the States to take preventive measures. Such action was taken, during the decade, by nine States, either by the enactment of new laws or the strengthening of existing legislation against lynching. These States were Alabama, Kansas, Kentucky, Minnesota, New Jersey, North Carolina, Pennsylvania, Tennessee, and West Virginia.

The decrease in lynching during the decade is

shown by the following table, which compares the number of lynchings, 1914-24, with the number in each of the three previous decades.

COMPARISON OF LYNCHINGS BY DECADES  
1884-1923

| Decade         | Number of Lynchings |         |       |
|----------------|---------------------|---------|-------|
|                | White               | Negroes | Total |
| 1884-1893..... | 751                 | 990     | 1,741 |
| 1894-1903..... | 322                 | 1,020   | 1,342 |
| 1904-1913..... | 63                  | 673     | 736   |
| 1914-1923..... | 56                  | 517     | 573   |

**LYNN.** A manufacturing city of Massachusetts. The population increased from 89,336 in 1910 to 99,148 in 1920 and to 102,683 by estimate of the Bureau of the Census for 1923. The form of government was changed from the commission to the mayor and council type. In 1924, the city was spending \$1,500,000 for sewer development, and about \$3,000,000 on new schools. The value of the shoes produced in Lynn increased from \$46,660,000 in 1909 to nearly \$100,000,000 in 1924, and the total value of all manufactures rose from \$71,503,000 to more than \$160,000,000 during the same period.

**LYON, BETHUEL B. VINCENT** (1880- ). An American physician, gastro-enterologist, who has introduced into clinical medicine a new method of diagnosis and treatment of gall bladder disease, termed by him "nonsurgical drainage of the gall bladder"; which is secured through the introduction of the duodenal sound through the stomach. Dr. Lyon received the degree of M.D. from Johns Hopkins in 1907 and was appointed professor of clinical medicine in Jefferson Medical College, in the department of gastro-intestinal diseases. He had done much original work in connection with the diagnostic and therapeutic use of the duodenal sound, collaborating for a time with the late Dr. Meltzer, and in 1923 first appeared his pioneer work *Nonsurgical Drainage of the Gall Ducts*, which has given rise to much controversy.

**LYS RIVER, BATTLES OF.** See WAR IN EUROPE, *Western Front*.

# M

**McADOO, WILLIAM GIBBS** (1863- ). An American cabinet officer (see VOL. XV). In 1913 he was appointed Secretary of the Treasury by President Wilson. His tenure of this office marked by the enormous complications and transactions of the entrance of the United States into the War, and in this work he showed great versatility and efficiency. In addition to his duties as Secretary of the Treasury, he was also Director General of Railways in 1917-19 and ex-officio chairman of the Federal Reserve Board. He resigned as Secretary of the Treasury on Dec. 10, 1918, and as Director General of Railways on Jan. 10, 1919. On May 7, 1914, he married Eleanor Wilson, daughter of Woodrow Wilson. He was the most prominent candidate for the Democratic nomination for the presidency until, in the early part of 1924, it was disclosed before the oil investigating committee of the Senate that he had been employed at a large annual salary by Edward F. Doheny, the oil magnate, some of whose leases in California were alleged to be fraudulent. Although Mr. McAdoo's employment had no connection with these leases and was considered, from a legal standpoint, quite legitimate, it materially affected his chances for the nomination. He was engaged in the practice of law in New York City. In the Democratic national convention held in New York City in 1924, McAdoo and Governor Smith of New York controlled enough votes to checkmate each other. The result was that neither was nominated, and John W. Davis was selected as a compromise candidate after more than 100 ballots had been cast. See RAILWAYS.

**MACALESTER COLLEGE.** A coeducational college under Presbyterian control, founded in 1884, at St. Paul, Minn. The number of students increased from 399 in 1913 to 634 in 1924, the faculty from 21 to 37 members, and the library from 13,600 to 16,500 volumes. In an endowment campaign in 1920 \$915,220 was raised. The gymnasium was under construction in 1924. Elmer Allen Bess, D.D., succeeded Thomas Morey Hodgman, LL.D., as president in 1918 and was succeeded in turn by John C. Acheson, Ph.D., in 1924.

**McALEXANDER, ULYSSES GRANT** (1864- ). An American army officer, born in Dundas, Mich. He graduated from the United States Military Academy in 1887 and was commissioned 2d lieutenant in the same year. During the Spanish-American War he served in the field and was recommended for promotion for gallantry under fire. He saw service also in the Philippines and in 1906 was a member of the General Staff Corps. After serving as instructor of troops in 1916-17, he was given command of the 18th Infantry in France. As commander of the 38th Infantry, he took part in the second battle of the Marne and in other campaigns, including the last great German of-

fensive. He broke the great German offensive on the Marne on July 15, 1918, and won the sobriquet of "The Rock of the Marne." He received decorations from the American, French, and Italian government. He wrote *History of the Thirteenth Regiment* (1905).

**McALLISTER, ADDAMS STRATTON** (1875- ). An American electrical engineer (see VOL. XIV). During 1918 he became connected with the Ordnance Department, Washington, D. C., and in 1921 with the Bureau of Standards. He contributed many articles on engineering subjects to technical publications during the period 1914-24 and published *The Descendants of John Thomson* (1917).

**McARTHUR, DOUGLAS** (1880- ). An American soldier, born in Arkansas. He graduated from the United States Military Academy in 1903 and was commissioned 2d lieutenant of engineers in the same year. In 1917 he was appointed colonel of infantry in the National Army and in the same year became Chief of Staff of the 42d Division. He commanded the 84th Infantry Brigade in 1918 and the 42d Division later in the same year. He took part in all the great operations in France and served with the Army of Occupation in Germany. In 1919 he was appointed superintendent of the United States Military Academy and in 1923 became commander of the department of the Philippines. He received several divisional citations and decorations from the French, Italian, and Belgian governments.

**McBAIN, HOWARD LEE** (1880- ). An American lawyer and educator, born in Canada. He graduated from Richmond (Va.) College in 1900 and afterward studied at Columbia and the University of Chicago. After teaching in schools in Richmond he lectured on constitutional history at the University of Virginia. He was appointed instructor of political science at Columbia in 1907, and in 1909 he became dean of the College of Political Science at George Washington University. From 1910 to 1913 he was associate professor of political science at the University of Wisconsin and in 1917 became associate professor of municipal science and administration and Eaton professor at Columbia University. He was a member of many legal and learned societies and was the author of *How We Are Governed in Virginia and the Nation* (1908); *The Law and Practice of Municipal Home Rule* (1916); and *American City Progress and the Law* (1917).

**McCARRISON, ROBERT** (1878- ). A distinguished Irish physician. His professional activities have been largely associated with Hindustan and with the disease of goitre. Born in Lisburn, County Antrim, he was educated at Queen's College, Belfast, and entered the Indian Medical Service in 1901. He developed a special interest in goitre and cretinism and during 1913-14 investigated these affections for the government. Later he visited many medical centres in English-speaking countries to lecture

on goitre and made a tour of the United States for this purpose in 1921. His major writings are *Collected Papers on Goitre and Cretinism* (1916); *The Thyroid Gland in Health and Disease* (1917), and *Studies in Deficiency Disease* (1921). He was placed in charge of the Pasteur Institute at Coonoor on its establishment.

**McCHORD, CHARLES CALDWELL** (1859- ). An American lawyer and public official (see VOL. XIV). From 1910 he served as a member of the Inter-State Commerce Commission and from 1915 as chairman and was reappointed a member of the Commission in the same year. In 1918-19 he was a member of the Railway Wage Commission and arbitrator of the War Labor Board.

**McCOLLUM, ELMER VERNER** (1879- ). An American biochemist, born near Ft. Scott, Kan., and educated at Kansas and Yale Universities. From 1907 to 1917 he held the chair of agricultural chemistry in the University of Wisconsin, resigning to accept the professorship of biochemistry in the Johns Hopkins University School of Hygiene and Public Health. He has published many papers on nutrition, diet, vitamins, etc., and several textbooks, which include *Textbook of Organic Chemistry* (1916); *The Newer Knowledge of Nutrition* (1918), and *The American House Diet* (1920). Professor McCollum has published an account of the fourth vitamine, known as Vitamine D, lack of which from the nutriment is believed to play an important rôle in the genesis of rickets.

**McCOMBS, WILLIAM FRANK** (1875-1921). An American lawyer (see VOL. XIV). From 1912 until 1916 he was chairman of the Democratic National Committee. He was offered but declined the ambassadorship to France. Both before and after his death there was much discussion in respect to the controversy between him and the supporters of the Wilson administration as to whether he had been fairly treated by Mr. Wilson in view of the great services which he had rendered in bringing about the latter's nomination and election. A volume giving Mr. McCombs' side of the controversy was published in 1921.

**McCOOK, PHILIP JAMES** (1873- ). An American jurist, born at Niantic, Conn., and educated at Trinity College and the Harvard Law School. In 1899 he began practice of law in New York. He was special master in the United States District Court in 1919 and in the same year became Justice of the Supreme Court of New York State. He served in the Spanish-American War in Cuba and the Philippines and in the War in Europe as major in the Adjutant-General's department. He was a trustee of Hunter College and the Law Committee of the Charity Organizations Society and Legal Aid Society.

**McCORMICK, CYRUS HALL** (1859- ). An American manufacturer, born at Washington, D. C., and educated in the public schools. He went into his father's business. He was the inventor of the reaping machine. From 1894 to 1902 he was president of the McCormick Harvesting Machine Company and of the International Harvester Company from 1902 to 1919. In 1917 he was a member of the special diplomatic mission of the United States to Russia. He was a trustee of Princeton University and a director of the McCormick Theological Seminary.

**McCORMICK, VANCE CRISWELL** (1872- ).

An American newspaper publisher and public official, born in Harrisburg, Pa., and educated at Yale University. For several years he was engaged in the newspaper business in Harrisburg. He served as mayor of that city from 1902 to 1905. In 1914 he was Democratic candidate for governor and in 1916 served as chairman of the Democratic national campaign committee. He was chairman of the War Trade Board from 1917 to 1919 and in the former year was also a member of the War Commission of Great Britain and France. At the peace conference in Paris, he acted as adviser to the American commission. He was a director of many important financial institutions and a member of the Yale Corporation.

**McCOY, FRANK ROSS** (1874- ). An American soldier, born in Lewistown, Pa. He graduated from the United States Military Academy in 1897 and was appointed 2d lieutenant of the 8th Cavalry in the same year. He served on the western frontier in Cuba, in the Philippines, and in the Santiago campaign. In Cuba and the Philippines he acted as aide to General Wood and was for several years aide to President Roosevelt. He was appointed a member of the General Staff in 1911 and after service as military attaché in Mexico became a member of the General Staff of the American Expeditionary Forces in 1917. He commanded the 63d Infantry Brigade in 1918 and was director of the army transport service and deputy director general and later director general of transportation for the A. E. F. in 1918-19. In the latter year he also served as chief of staff to the American military mission to Armenia and as special commissioner to the Philippines. He wrote *Principles of Military Training* (1918).

**McCOY, HERBERT NEWBY** (1870- ). An American chemist, born at Richmond, Ind., and educated at Purdue and Chicago Universities. He entered professional practice in Chicago and held the chair of chemistry and physics at Fargo University, after which he returned to the University of Chicago as assistant in chemistry. In 1899 he became assistant professor at the University of Utah. In 1901 he returned again to Chicago and was professor there from 1911 to 1917, when he resigned to accept the vice presidency of the Lindsay Light Company. From 1919 he was president of the Carnotite Reduction Company. His researches covered quinazolin derivatives in organic chemistry; equilibrium in carbonate solutions and secondary ionization constants in physical chemistry; rare earths in mineral chemistry, and radioactivity. He has published papers in these subjects. He wrote, with Ethel M. Terry, an *Introduction to General Chemistry* (1919) and *A Laboratory Outline of General Chemistry* (1919).

**McCULLOUGH, ERNEST** (1867- ). An American civil engineer, born on Staten Island, N. Y., and educated at the Van der Naillen School of Engineering in San Francisco. He at once entered on the practice of his profession as a civil engineer, at first in San Francisco, and later in Chicago. During 1893-96 he was editor of *Engineer and Contractor* in San Francisco; he became associate editor of *Engineering-Contracting* (Chicago) in 1909 and of the *Railway Age* in 1910. He was later an associate editor of *The American Architect*. During the War he was a lieutenant-colonel in the Chemical Warfare Service in France, and in 1919-20, director of the officers' school for that service at

Lakehurst, N. J. He is the author of *Country Roads* (1891); *Farm Drainage* (1892); *Municipal Public Works* (1894); *Engineering Work in Towns and Cities* (1906); *Reinforced Concrete* (1908); *Engineering as a Vocation* (1911); *Practical Surveying* (1915); and *Practical Structural Design* (1917).

**MCCULLY, NEWTON ALEXANDER** (1867- ). An American naval officer, born in Anderson, S. C. He graduated from the United States Naval Academy in 1887 and in 1889 was made ensign. He was promoted to be commander in 1909, captain in 1913, and rear-admiral in 1919. His duties included the command of several important battleships and service in various capacities on shore. From 1914 to 1917 he was naval attaché at St Petersburg and represented the Navy Department in connection with the Russian commission to the United States. In 1917-18 he commanded the patrol squadron off the coast of France and in 1919 was commander of the American naval forces in American waters. In the following year he acted as special agent for the Department of State in southern Russia and in 1921-22 commanded the patrol force of the Atlantic fleet.

**MCDERMOTT, GEORGE ROBERT** (1860- ). An American naval architect, born at Glasgow, Scotland. After an academic and technical education in Glasgow, he served as naval architect for several shipbuilders in Scotland and in the naval construction works in England. He removed to the United States and was successively assistant professor of naval architecture and professor of naval architecture in charge of the Department of Naval Architecture and Marine Engineering at Sibley College in Cornell University. During the War he served with the United States Shipping Board and the Emergency Fleet Corporation and as technical adviser of the American Bureau of Shipping in 1919. He was a member of many architectural societies.

**MACDONALD, JAMES RAMSAY** (1866- ). A British public official, leader of the Labor party (see VOL. XIV). He was not in sympathy with Great Britain's entry into the War and was defeated for Parliament in 1918. But in 1922 he was elected, and the Labor party was numerically the second party in the House of Commons. Ramsay MacDonald became the official leader of the Opposition. Two years later, on Jan 22, 1924, he was made Prime Minister and headed the first Labor government in Great Britain. See GREAT BRITAIN.

**MCDONALD, JOHN DANIEL** (1863- ). An American naval officer, born in Machias, Me. He graduated from the United States Naval Academy in 1884 and was promoted to be commander in 1908, captain in 1911, and rear-admiral in 1917. He served during the Spanish-American War and commanded several war vessels. From 1913 to 1915 he was a member of the staff of the Naval War College and in 1915-16 was chief of staff of the Atlantic fleet. He was appointed commandant of the New York Navy Yard in 1918, with the rank of vice admiral.

**MCDUGALL, WILLIAM** (1871- ). One of the leading Anglo-American psychologists (see VOL. XIV). During the War he was attached to the medical service of the British Army. In 1920 he was called from his post at Oxford to head the psychology department at Harvard University. In his *Outline of Psy-*

*chology* (1923), the eminent psychologist modified his conception of instinct so as to allow for growth and transformation of the presumed hereditary dispositions.

Professor McDougall's other works deal largely with the problems of national psychology which transcend mere science and involve ethical theory. *The Group Mind* (1920) and *Is America Safe for Democracy?* (1922) are noteworthy for their defense of the superiority of the Nordic race. *Ethics and Some Modern World Problems* (1924) contains a warning against sentimental idealism as a guiding principle of national conduct. He was also interested in psychical research and took a leading part in the activities of both the British Societies for Psychical Research. See SOCIAL PSYCHOLOGY.

**MCELROY, ROBERT (McNUTT)** (1872- ). An American educator, born at Perryville, Ky., and educated at Princeton University, in Germany, and at Oxford. In 1898 he was instructor of history at Princeton and was successively assistant professor of American history and Edwards professor of American history (from 1909). He was also head of the department of history and politics at Princeton, 1912-16, and was the first American exchange professor to China in 1916-17. He lectured in China, Japan, and the Philippines on government. He was educational director of the National Security League from 1917 to 1919 and was organizer of the national campaign for the celebration of "Constitution Day" in 1919. He was a member of many learned societies and wrote *Kentucky in the Nation's History* (1909); *The Winning of the Far West* (1914), and *The Representative Idea in History* (1917).

**MCELWAIN, FRANK ARTHUR** (1875- ). An American bishop, born at Warsaw, N. Y., and educated at Trinity College and the Seabury Divinity School. In 1902 he was ordained deacon and became a priest in the following year. He held several pastorates in Missouri and from 1907 to 1912 was on the faculty of the Seabury Divinity School. In 1912 he was elected suffragan bishop of Minnesota and was consecrated bishop in 1917.

**McFARLAND, JOSEPH** (1868- ). An American pathologist and bacteriologist, born at Philadelphia. Soon after receiving his M.D. from the University of Pennsylvania in 1889 he became professor of pathology and bacteriology in the Medicochirurgical College, from which he resigned in 1916 to accept the same chair in his Alma Mater. He has published several textbooks: *Pathogenic Bacteria* (1886); *Textbook of Pathology* (1904); and *Biology, General and Medical* (1910). A semipopular work, *Fighting Foes too Small to See*, was published in 1924, and in the same year his *Surgical Pathology*. He also collaborated with Deaver and McFarland in *The Breast* (1917).

**McFEE, WILLIAM** (1881- ). An American author, born in London, and educated in the East Anglican School, Bury St. Edmunds, England. He entered the marine service as engineer and chief engineer of transports. He wrote *An Ocean Tramp* (1908), which was followed by *Aliens* (1914); *Casuals of the Sea* (1916); *Captain Macedoine's Daughter* (1920); *A Six-Hour Shift* (1920); *Harbors of Memory* (1921); *Command* (1922); and *Race—a Prelude* (1924). His books show great descriptive power and an unusually attractive style.

**MCGILL UNIVERSITY.** A Canadian in-

stitution at Montreal, Quebec, founded in 1821, standing at the head of a group of affiliated colleges and schools, and itself affiliated with the universities of Oxford, Cambridge and Dublin. The student enrollment numbered 1600 in 1914, dropped during the War to 1045, but rose again to 2767 in 1923-24. The faculty increased during the period 1914-24 from 265 to 417 members and the library from 184,000 to 215,900 volumes. The productive endowment was increased correspondingly from \$8,207,000 to \$17,344,210, and the annual income from \$820,000 to \$1,722,765. The university received \$1,000,000 in 1918 from the Carnegie Corporation of New York, "in recognition of the noble and devoted service and sacrifice of McGill toward Canada's part in the great war." Sir William C. Macdonald bequeathed various sums to the university, including \$500,000 towards the endowment of the Medical School, \$300,000 toward the endowment of the Conservatory of Music, \$20,000 to provide traveling scholarships in the faculty of law, and \$1,000,000 for Macdonald College. The university also received \$100,000 from the estate of James Ross in 1914. In 1920 subscriptions made to the Centennial Fund totaled \$4,440,000, not including gifts of \$1,000,000 each from the Rockefeller Foundation and from the Quebec government. The biological building was erected in 1922 at a cost of \$716,000, and the pathological building was completed in 1923 at a cost of \$450,000. The course in the School of Commerce was lengthened from three to four years in 1923. Sir Arthur Currie, G.C.M.G., K.C.B., LL.D., succeeded Sir William Peterson, G.C.M.G., K.C.B., LL.D., D.Litt., as president in 1920.

**McGLACHLIN, EDWARD FENTON** (1868- ). An American soldier, born in Fond du Lac, Wis. He graduated from the United States Military Academy in 1889 and was commissioned in the artillery. He served in various capacities with the field artillery and was promoted to be colonel in 1916. In the following year he was made brigadier-general of the National Army and in 1918 major-general. He served in the Philippine campaigns and from 1914 to 1916 was commandant of the School of Fire for Field Artillery. In 1917 he was appointed commander of the 165th Field Artillery Brigade and later commanded several other brigades. He was made chief of artillery of the 1st Army Corps in 1918 and commander of army artillery and chief of artillery of the 1st Army in the same year. From November, 1918, to September, 1919, he was commander of the 1st Division, and from 1919 to 1921 he commanded the 7th Division. From the latter year he was commandant of the Army War College and contributed many articles to army periodicals.

**MacGOWAN, KENNETH** (1888- ). An American author, born at Winthrop, Mass., and educated at Harvard. He became editor of *The Theatre Arts*, a monthly magazine, in 1919. After 1923 was dramatic critic for *Vogue*. Previously he had been dramatic, literary, and photoplay critic for the *Philadelphia Evening Ledger* (1914-17); publicity director for the Goldwyn Picture Corporation (1917-18); special writer on the *New York Tribune* (1918); advertising agent for the Goldwyn Picture Corporation (1919), and critic for the *New York Globe* (1919-23). His books on the theatre are *The Theatre of To-Morrow* (1921); *Continental*

*Stagecraft* (1922), and *Masks and Demons* (1923).

**McGRAW, JOHN J.** (1873- ). Professional baseball player and manager, born at Truxton, N. Y. He was with the Olean Club in 1890, Cedar Rapids in 1891, and Baltimore, 1891 to 1899, becoming manager in the last-named year. In 1900 he played with the St. Louis National League team and managed the Baltimore American League Club in 1901 and 1902. Since 1902 he has been manager of the New York National League team, familiarly known as the "Giants," winning penants in 1904, 1905, 1911, 1912, 1913, 1917, 1921, 1922, and 1923 and world's championships in 1905, 1921, and 1922, a record of achievement attained by no other big league manager.

**McGREGOR, JAMES HOWARD** (1872- ). An American zoologist, born at Bellaire, Ohio. He was educated at Ohio State and at Columbia Universities. He was assistant in zoology at Ohio State University (1894-95). In 1897 he went to Columbia University, where he was successively assistant, tutor (1899-1904), lecturer (1904-06), instructor (1906-07), adjunct professor (1907-14), associate professor (1914-24), and professor of zoology. He published articles on vertebrate morphology and paleontology and modeled an important series of reproductions of heads of types of primitive man.

**MACHEN, ARTHUR** (1863- ). An English writer. His early books include *The Chronicles of Clemency*, *The Great God Pan*, *The Three Impostors*, *The Hill of Dreams*. Of late years his books have acquired considerable vogue both in England and the United States. Among his recent publications are *The Great Return*, *The Secret Glory*, and *Far-Off Things*.

**MACHINE GUN ORGANIZATION.** See **ARMIES AND ARMY ORGANIZATION.**

**MACHINE GUNS.** See **ORDNANCE; SMALL ARMS.**

**McINTYRE, FRANK** (1865- ). An American military officer, born at Montgomery, Ala., and educated at the United States Military Academy. He entered the United States Army as second lieutenant in the 19th Infantry, serving in various ranks until he attained that of brigadier-general in 1912. Meanwhile he saw duty at different posts, chiefly on the Mexican border, until the war with Spain, in which he participated in the Porto Rico expedition in 1898. He was in the Philippines during 1899-1902, after which for two years he was with the general staff. He was attached to the Bureau of Insular Affairs in 1905 and became its chief in 1912. During the War in Europe he was assistant chief of staff with the rank of major-general.

**McKEE, RALPH HARPER** (1874- ). An American chemist, born at Clinton, Mo., and educated at Wooster and Chicago Universities. During 1901-09 he was professor of chemistry at Lake Forest, and during 1909-16 he held a similar chair at the University of Maine; in 1917 he became professor of chemical engineering at Columbia. In New York, Professor McKee had a valuable commercial practice and was consultant to various chemical corporations. During the War he was director of the United States Ordnance School of Explosives.

**McKENNA, REGINALD** (1863- ). An English statesman and financier (see **VOL. XIV**). He was a Liberal member of Parliament from 1895 to 1918, and from 1911 to 1915 he served

as Home Secretary. In the latter year he was Chancellor of the Exchequer, and as such brought in the famous budget of September, 1915, recognized as an able attempt to deal with the financial conditions arising out of the War. In 1915 he also introduced a new war loan. He retired from politics to assume the chairmanship of the London Joint Stock and Midland Bank in 1919. He was a member of the British-American Debt Fund Commission, in 1923.

**McKENNA REPORT.** See REPARATIONS.

**MACKENSEN, AUGUST VON** (1849- ). A Prussian field marshal, born at Hausleipnitz in Saxony. He was at Danzig commanding the 17th Army Corps when the Crown Prince was sent there to be kept from troublesome political activities. On the eastern front in 1914 he commanded the 9th Army and won engagements with the Russians at Kutno, Lodz, and Lowitz. In 1915 he headed the German troops in western Galicia and later in the same year was made a field marshal. He was the commanding general also of the troops sent to Serbia and to Rumania during 1915 and 1916. After the Armistice in 1918, the French interned him at Neusatz, where he was forced to remain until nearly the end of 1919, although the German government protested vigorously.

**McLEAN, ANGUS WILTON** (1870- ). An American lawyer, born in Robeson County, N. C., and educated in the law department of the University of North Carolina in 1892. In the same year he began the practice of law. He took an active part in State Democratic politics. From 1918 to 1920 he was director of the War Finance Corporation in Washington and was its managing director in 1920-21. In the same year he served as Assistant Secretary of the Treasury. He was a member of several commissions during the War in Europe. He was president of the trustees of the Flora MacDonald College and of the Union Theological Seminary at Richmond, Va., and a member of many learned societies.

**MACLEOD, JOHN JAMES RICKARD** (1876- ). A Scotch-American physiologist and Nobel prize winner, born at Dunkeld, Scotland, and educated at the University of Aberdeen. In 1898 he devoted himself to the study of physiology and in 1903 was called to the chair of physiology at Western Reserve University, to succeed G. N. Stewart. He resigned this professorship in 1917 to accept a like chair in the University of Toronto, where he became the senior member of the group of workers who discovered insulin. The Nobel prize in medicine for 1923 was divided between MacLeod and Banting (q.v.). He had already published a book on diabetes. Beginning as a collaborator in small textbooks on physiology and chemistry, he later wrote *Diabetes* (1913) and *Physiology and Biochemistry in Modern Medicine* (1918). A prolific contributor to periodical literature, he published many papers on insulin.

**MacMONNIES, FREDERICK (WILLIAM)** (1863- ). An American sculptor (see VOL. XIV). He executed the colossal group, "Civic Virtue," at the City Hall Fountain in New York (1919). It was the subject of considerable controversy.

**MacNEIL, HERMON ATKINS** (1866- ). An American sculptor (see VOL. XIV). He won the gold medal at the Panama-Pacific International Exposition in 1915. Two years later he was awarded the medal of honor of the Architectural League in New York. In 1923 he was

awarded the Saltus medal for excellence.

**McRAE, JAMES HENRY** (1863- ). An American soldier, born in Lumber City, Ga. He graduated from the United States Military Academy in 1886 and was commissioned 2d lieutenant in the same year. He rose to the rank of adjutant-general in 1913 and in the following year was appointed colonel of infantry. He was commissioned major-general in the National Army in 1918 and brigadier-general in the Regular Army in 1920. He took part in the Spanish-American War and in the campaigns in the Philippines. In 1917 he commanded the 9th Brigade, 5th Division, and in 1918-19 was commander of the 78th Division. He participated in St. Mihiel and in the Meuse-Argonne operation. From 1921 he was assistant chief of staff. He received decorations from the American and foreign governments.

**MADAGASCAR.** A French island colony off the southeastern coast of Africa. Area, 226,916 square miles; population, census of 1921, 3,387,968, of whom 17,149 were French and 10,310 other non-Malagasy, largely Asiatics. The populations of the chief towns were, in 1921: Antananarivo, the capital, 63,115; Tamatave, 15,000; Diégo Suarez, 10,377; Mananjary, 8927; Fianarantsoa, 8231. The principal ports were Tamatave (east coast), Majunga (northwest), Diégo Suarez (north), Tuléar (southwest). Agricultural products showed increases generally during the period 1912-22. In 1921, 12,800 tons of rice were exported (value 12,818,000 francs), about 13,500 tons of manioc (value 14,520,000 francs), and 21,000 tons of vegetables (value 21,000,000 francs). Other crops of importance were sugar cane, coffee, cacao, and vanilla. Besides these, the export trade embraced raffia, graphite, tanning bark, caoutchouc, tapioca, and gold. The extensive cattle breeding accounted for the importance of the hide industry as well as the appearance of local meat packing plants. Large factories for preserving and chilling meats were established at Majunga, Diégo Suarez, and other centres. In 1921 the export of preserved meats totaled 7,764,000 francs, although in 1922 this was only 2,880,000 francs. Cattle numbered 7,518,657 in 1923, as compared with 5,320,200 in 1913. Exports for 1913, 1920, 1921 and 1922 were 56,054,377 francs, 235,942,698, 108,308,000 and 138,472,491. Imports for the same years were 46,747,000 francs, 279,694,657, 225,921,000, and 173,921,000. Leading imports were cotton goods, beverages, metals, machinery, and clothing. Proportions of exports taken and imports sent for 1921 by leading countries trading with Madagascar were: France, 65 and 78 per cent; French colonies, 9 and 6 per cent; United Kingdom, 12 and 3 per cent; British colonies, 8 and 9 per cent. The United States came next after these. In 1921, 5604 vessels of 1,566,786 tons entered and 5665 vessels of 1,555,217 tons cleared at Madagascar ports. In 1912, 1,756,764 tons entered. Besides that from Antananarivo to Tamatave (240 miles), the following railways were in the course of construction: Antananarivo-Antsirabe (240 miles), of which 27 miles were finished in 1923, Moramanga-Ambatandrazaka (89 miles), a branch of the Tamatave railway projected to reach the northern provinces. A good system of metalled roads, 1611 miles long, made communication between the various centres easy. The 1923 budget totaled 90,660,991 francs, as compared with the 1911 budget of 31,153,000 francs. By Jan. 1, 1922, the public debt had

mounted to 105,000,000 francs. The colony prospered during the War, and work on internal improvements went on steadily. In 1921 an ambitious programme for the electrification of railways and the construction of a hydroelectric power station on the Vohitra River was announced. This project was later augmented to include the construction of 288 miles of wide-gauge and 468 miles of narrow-gauge road.

**MAETERLINCK, MAURICE** (1862- ). A Belgian poet (see Vol. XIV). During the War he performed effective service in relief work in France and Belgium and wrote much in opposition to the German rule in Belgium. His later books include *Wrack of the Storm* (1916); *The Betrothal* (1918); *The Burgomaster of Stilemonde* (1918); and *Les Sentiers dans la Montagne* (1919). He visited the United States in 1921, with the intention of lecturing in various cities, but his lack of acquaintance with the English language led to the abandonment of this enterprise.

**MAGNESIUM.** See CHEMISTRY.

**MAH-JONGG, PUNG-CHOW, or PE-LING.** An ancient Chinese game which has attained considerable popularity throughout Europe and America in recent years. It is played with pieces, "tiles," somewhat after the nature of dominoes but lends itself more readily to the gambling instinct than the latter game. The so-called "sets" comprise as many as 144 pieces, the higher-priced ones being made from ivory and most hands mely carved.

No standard rules and regulations have as yet been adopted, the methods of playing the game varying greatly. The Chinese confine themselves chiefly to building up a strong defense whereas the Europeans and Americans concentrate on the wide opportunities the game offers for offensive tactics.

Fairly comprehensive works on the game are: *How to Play Mah-jongg*, by Jean Bray, Putnam's Sons, New York and London, 1923, and *How to Play Pung-Chow* by L. I. Harr, Harper and Brothers, New York and London, 1923.

**MAINE.** Maine is the thirty-eighth State in size (33,040 square miles), and the thirty-fifth in population; capital, Augusta. The population increased from 742,371 in 1910 to 768,014 in 1920, a gain of 3.5 per cent. The white population rose from 739,995 to 765,695, the native whites increasing from 629,862 to 658,346. The negro population decreased from 1363 to 1310; the foreign-born whites, from 110,133 to 107,349. The urban population mounted from 262,248 to 299,569, while the rural population fell from 480,123 to 468,445. The growth of the principal cities was as follows: Portland, (1910) 58,571 to (1920) 69,272; Lewiston, 26,247 to 31,791; Bangor, 24,803 to 25,978.

**Agriculture.** Maine was one of the New England States in which there was only slight decline in the percentage of rural population, from 64.7 in 1910 to 61 in 1920. While the population of the State increased 3.5 per cent in the decade 1910-20, the number of farms decreased 19.6 per cent (from 60,016 in 1910 to 48,227 in 1920); the acreage of land in farms, from 6,296,859 to 5,425,968, and the improved land in farms, from 2,360,657 to 1,977,329 acres. The total value of farm property showed an apparent increase, from \$199,271,998 in 1910 to \$270,526,733 in 1920, or 35.8 per cent; the average value per farm, from \$3320 to \$5609, or 68.9 per cent. In interpreting these values, however,

and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 32.9 in 1910 to 28.4 in 1920; the percentage of improved land from 37.5 to 36.4. Of the 48,227 farms in 1920, 45,437 were operated by owners, 786 by managers, and 2004 by tenants. The comparative figures for 1910 were 56,454, 999, and 2563. White farmers in 1920 numbered 48,214, as compared with 59,987 in 1910; foreign-born farmers, chiefly Canadians, numbered 4384, compared with 4973. Farms free from mortgage in 1920 numbered 30,665; in 1910, 41,309. Those under mortgage numbered 13,023 in 1920; in 1910, 14,948. The number of dairy cows in 1920 was 217,021, compared with 156,819 in 1910; "beef cows," 9956 and 8019; sheep, 119,471 and 149,934. There was a noticeable increase in dairying. The growing of potatoes for seed had become a large industry. The estimated production of the chief farm crops in 1923 was as follows: corn, 1,256,000 bushels; spring wheat, 220,000; oats, 4,780,000; barley, 104,000; potatoes, 27,454,000; and hay, 1,513,000 tons. Comparative figures for 1913 are: corn, 608,000 bushels; wheat, 76,000; oats, 5,600,000; barley, 140,000; potatoes, 28,160,000; and hay, 1,194,000 tons.

**Manufactures.** While Maine is not one of the most important industrial States, it has manufacturing interests of great importance. See UNITED STATES, *Manufactures*.

**Education.** In the decade 1914-24 there was a steady improvement in educational conditions in the State. Special attention was given to the needs of rural communities. The Legislature during this period enacted many important measures affecting education. This was especially true in 1919, when provision was made for rotation agricultural schools under the supervision of the State Board for Vocational Education; the industrial education act was amended to provide for a programme of Americanization; a rural teaching provision was virtually established, which is said by experts in education to be one of the most direct approaches to the rural school problem yet presented; and a State-wide compulsory physical education law and an act reorganizing the law affecting the schools in unorganized territory were passed. More recent advances in the State are the establishment of the State school fund, to be distributed on the basis of teaching positions, aggregate daily attendance, and school census, approximately one-third each; and the establishment of a special school for the training of rural leaders, 100 each year. Consolidation of schools is gradually taking place, and rural school improvement is definitely and systematically pursued. By an act of the Legislature of 1923, all towns were required to have their buildings in a sanitary and satisfactory condition by 1927. In 1914 the total enrollment was 146,620; in 1920, it had increased to 149,255, of whom 129,537 were enrolled in elementary schools and 19,718 in secondary schools. In 1922 the total enrollment was 159,790 (131,413 in elementary and 28,377 in high schools). The total expenditure for schools was about \$6,000,000 in 1920. The percentage of illiteracy in the State decreased from 4.7 in 1910 to 3.9 in 1920: among the native

white, from 1.5 per cent to 1.3; among the foreign-born whites, from 14.5 to 12.0; and among the negroes, from 10.3 to 6.8 per cent.

**Finance.** See **STATE FINANCES.**

**Political and Other Events.** With the exception of one year, the Republicans continued to control the government of the State in the decade 1914-24. In 1916 Carl E. Milliken was nominated for governor by the Republicans, while Governor Curtis was renominated by the Democrats. For United States Senator, Frederick Hale received the Republican nomination and Charles F. Johnston the Democratic. The death of Senator Edwin C. Burleigh on June 16, 1916, made an extra primary election necessary to nominate his successor. Bert M. Fernald, a former governor, was nominated by the Republicans and Kenneth C. M. Sills, president of Bowdoin College, by the Democrats. In the September elections, Mr. Milliken was elected governor and Hale and Fernald United States Senators. In the presidential election in November, 1916, Charles E. Hughes received 69,506 votes; President Wilson, 64,118. The first national park east of the Mississippi, comprising 5000 acres, was created at Mt. Desert Island, in July, 1916. On Sept. 10, 1917, a woman suffrage amendment was defeated. At the same election an amendment was carried giving the governor the right to remove delinquent sheriffs. A budget system was inaugurated in this year. At elections held in 1918, Carl E. Milliken was reelected governor, and Senator Fernald was reelected to the Senate. The Republicans also elected a large majority of the members of the Legislature. In the presidential voting of 1920, W. G. Harding received 136,355 votes; J. M. Cox, 58,961. In 1920, elections were held for governor and other State officers. Frederick H. Parkhurst, Republican, was elected governor. Governor Parkhurst died on Jan. 31, 1921, 24 days after he had taken the oath of office, and was succeeded as governor by Percival P. Baxter, President of the Senate. In 1922 Governor Baxter was reelected, and Senator Hale was reelected to the Senate. The State Republican convention held in May, 1924, instructed its delegates to vote for President Coolidge.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are indicated below. The Legislature of 1914 amended the workmen's compensation law. A woman suffrage measure failed by a narrow margin to pass the House of Representatives. The liquor laws were amended in 1917. The Legislature in 1919 ratified the Federal Prohibition Amendment; made provision for the voting of women for president; and passed a measure providing for the registration of persons employed as counsels or agents to promote or oppose legislation. The Legislature of 1921 passed measures regulating the use of aircraft, extended the jurisdiction of the Public Utilities Commission over certain motor vehicles, amended the laws relating to teachers' pensions, amended the State prohibition law to harmonize with the Federal law, provided for the payment of a bonus to soldiers and sailors who fought in the war with Spain, and amended the workmen's compensation law. In 1923 the Legislature passed a bill to facilitate coöperative marketing of agricultural products and made it criminal conspiracy for two or more persons to conspire to sell liquor in violation of the law. In this period was developed a policy of improved highways, and bonds to the amount

of \$9,000,000 had been authorized and issued, under public referendum. In 1923, the State refused, by public referendum, to institute a 48-hour law for women and minors. The majority opposed was over 20,000. The State water-power policy instituted by Fernald, prohibiting transmission of hydroelectric power beyond the borders of Maine, was constantly under fire but was not changed in this period.

**MAINE, UNIVERSITY OF.** A coeducational State institution at Orono, Me., founded in 1862. The university grew steadily during the years 1914-24, with 1058 students enrolled, 40,000 volumes in the library, and an income of \$396,000 at the beginning of that time, as compared with an enrollment of 1409 students, a library of 73,000 volumes, and an income of \$642,756 in 1923-24. The number of members of the faculty, including the staff of the experiment station, was increased from 126 in 1914 to 188 in 1924. A department of music was established in 1916. Clarence Cook Little succeeded Robert Judson Aley, LL.D., as president in 1922.

**MALACCA.** See **STRAITS SETTLEMENTS.**

**MALARIA.** During the ten years 1914-24, several features of interest in connection with malaria merit discussion. The War in Europe caused the disease to be carried to Great Britain and France after long years of immunity. It also drove home strongly the fact that malaria was still the world scourge which nullifies the efforts of man to civilize certain of the world's areas. The successful campaign against malaria in the temperate zones will not be repeated in the tropics until our knowledge of the disease has been increased. Quinine is powerless against certain types of tropical malaria; while the *anopheles* mosquito, which can be made the object of an intensive campaign of eradication in the United States, is not the sole means of distribution of the plasmodium in the tropics. Other insects are doubtless involved, of whose life cycle and habits little is known. Nor is tropical malaria the whole obstacle to its conquest. In some portions of the temperate zone the disease seems to attain increased virulence merely from the massing of troops, as in Saloniki during the War. Even in this latitude the disease behaved like tropical malaria, and not more than 20 per cent of the men responded to quinine; in this case, the infection probably proceeded from Egypt and could be classed as tropical. In regard to malaria in the United States, the work of the Rockefeller Foundation appears to show that the control of the disease is a matter simply of money and engineering. It is true that in rural sections the cost would be prohibitive and that systematic use of quinine must be added. This drug should be given in childhood and youth, for malaria is but infrequently contracted after this period.

**MALAY STATES, FEDERATED.** A federation of native states in the Malay Peninsula under British protection. The territory, made up of Perak, Selangor, Negri Sembilan, and Pahang, had an area of 27,506 square miles in 1921 and a population of 1,324,890. The 1911 population was 1,036,999. The 1921 population was composed of 510,821 Malays, 494,548 Chinese, 305,219 British Indians (172,465 in 1911), 5686 Europeans, and 3204 Eurasians. The chief town, Kuala Lumpur, had an estimated population of 80,000. Indian laborers continued to predominate on the estates. The leading activities centred in the rubber and tin industries. Coco-

nuts, rice, sugar, tapioca, pepper, and gambier were also cultivated. The country was little touched by the War and the succeeding depression, as the figures for trade indicate. Exports for 1910, 1920, 1921, 1922 were, in Straits dollars (1 S. dollar = \$0.56 normally), 102,851,990 dollars, 288,715,698, 129,463,762, and 135,116,634. Imports for the same years were 47,843,541 dollars, 170,522,123, 102,914,877, 78,666,032. Thus the balance of trade was consistently in favor of the Federation. Leading imports in 1922 were rice, machinery, cigarettes and tobacco, kerosene and motor oils, and cotton goods. The principal exports were rubber, tin ore, tin, and copra. In 1921, 3288 vessels of 1,713,382 tons entered, and 3289 vessels of 1,713,609 tons cleared ports of the Federated Malay States. Government accounts for 1911 and 1922 were: revenues, 35,056,244 and 52,494,110 dollars; expenditures, 24,680,723 and 49,811,007 dollars. The public debt on Jan. 1, 1922, was £4,759,907. In 1921 there were 1022 miles of railway in operation, compared with 614 miles in 1912, and 48 miles more under construction. The government scheme called for a network of railways over the whole peninsula.

**MALAY STATES, NONFEDERATED.** Five Malay states not included in the Federation. These were: (1) *Johore*, with an area of 7500 square miles in 1921; population, 282,244. The state greatly increased in population after 1911 and also progressed economically. Rubber, tin, and copra were the leading exports. Exports in 1921 and 1922 were Straits \$32,029,128 and \$37,861,597; imports were Straits \$24,730,135 and \$24,407,531. The government expenditure for 1922 was Straits \$8,785,873; revenue, \$8,625,223. (2) *Kedah* had an area of 3800 square miles and a population of 338,554. Chief articles of commerce were rice, rubber, coconut, tapioca. The tin mines were rapidly being exhausted. Exports in 1922 were \$6,844,127; imports, \$4,473,496. Government expenditure for 1922 was Straits \$5,290,239; revenue, \$4,966,904. (3) *Perlis* had an area of 316 square miles, and a population of 40,091. Leading products were rice, tin, and guano; the last two were declining. (4) *Kelantan* had an area of 5870 square miles and a population of 309,293. Agriculture was the leading activity; rice, rubber, and coconut raising ranked highest in importance. Rubber was the chief article of commerce. Exports in 1920, 1921, and 1922, were Straits \$6,206,642, \$2,848,171, and \$3,577,038; imports were \$5,679,510, \$4,108,595, and \$2,983,248. Valuable mining concessions, said to contain gold, galena, pyrites, and tin, were owned by British companies. State expenditures in 1921 and 1922 amounted to \$1,678,432 and \$1,539,318. (5) *Trengganu* had an area of 6000 square miles and a population of 153,092. Industries were similar to those of Kelantan. Exports in 1921 were Straits \$2,297,238; imports, \$2,574,946; in 1922, \$2,255,249 and \$2,287,158 respectively. State expenditures for 1921 and 1922 were \$759,054 and \$858,303. Tin and wolfram mines were worked. All the states had native sultans at whose courts resided British advisers representing Great Britain.

**MALIPIERO, FRANCESCO** (1882- ). An Italian composer, born at Venice. Although he began to study the violin at the age of six, his instruction was very desultory. Not until 1899 did he begin to study with interest and systematically at the Liceo Musicale in Venice, under

Enrico Bossi, whom he followed to Bologna (1902) on his becoming director of the Liceo there. After completing his studies, Malipiero devoted himself entirely to composition. At different times he lived in Venice, Rome, Paris, and Asolo. His earliest compositions were influenced by Wagner, but these he himself destroyed. He adopted the principles of futurism, of which he is one of the leading exponents. Of his operas, *Elan e Fuldano*, *Canossa*, *Il Sogno d'un Tramonto d'Autunno*, *Pantea*, and a trilogy, *L'Orfeide* (*La Morte delle Maschere*, *Sette Canzoni*, and *Orfeo*), only two were produced, *Canossa* (Rome, 1914) and *Sette Canzoni* (Paris, 1920). For orchestra he wrote *Dai Sepolcri*, *Dalle Alpi*, *Sinfonia delle Eroi*, *Sinfonia del Mare*, *Impressioni dal Vero* (two series), *Pause del Silenzio*, *Ditirambo Tragico*, *Illustrazioni di un Poema Cavalleresco*, *Armenia*, and *Sinfonia del Silenzio e della Morte*. His *Rispetti e Strambotti* for string quartet won the Berkshire prize (1920). He also wrote piano numbers.

**MALMÉDY.** See EUPEN, MALMÉDY, AND MORESNET.

**MALTA.** A British island colony in the Mediterranean Sea. The total area of Malta and its two islet dependencies is 118 square miles; civil population in 1921, 213,024, as compared with 211,864 in 1911. Agriculture was the chief activity. Leading products were wheat, barley, vegetables, grapes and other fruits, and cotton. Trade (excluding goods in transit) for 1913-14 and 1920 totaled £1,154,363 and £1,602,294 in exports, and £2,589,272 and £5,789,426 in imports. The state budget increased over the period 1913-21 from £423,108 in revenues and £402,521 for expenditures (1913-14), to £1,063,743 and £1,060,664 (1920-21). The British subvention for the latter year was £250,000. In 1921 a Maltese constitution was promulgated for the purpose of giving the natives a responsible government. A bicameral house was provided with its own local ministry. Certain "reserved" matters, however, including control of naval, military, and air forces, imperial interests, external trade, immigration, and treaties, were to be controlled by the governor and a nominated council. Valetta, the chief town, continued as an important port of call and the headquarters for the British Mediterranean fleet.

**MALTA FEVER.** See VETERINARY MEDICINE.

**MAN, ANCIENT.** See ANTHROPOLOGY.

**MAN, ISLE OF.** See GREAT BRITAIN.

**MAN, PREHISTORIC RACES OF.** For a long time zoölogists, botanists, and geologists have taken evolution as a matter of course, not especially emphasizing the application of the theory to man himself. Latterly, unusual interest has been shown in the origin of man. The increasing importance of the human problem and the growing tendency to look upon human conduct as a biological phenomenon, has brought the question of man's origin to the fore and made a direct challenge to established beliefs. By gradual accumulation the scientific world has come into the possession of a respectable series of prehistoric skeletal remains, some of which cannot be satisfactorily explained save as forms intermediate to the primates in general. Anthropology has noted how the knowledge of man's past advanced step by step until we were in possession of evidence for a series of cultures ranging in unbroken succession from

the crude Stone Age to modern times. Along with this, and somewhat parallel to it, can now be arranged successive biological or racial types of man.

As an introduction to the problem of prehistoric man the reader should have clearly in mind the time scale now recognized. According to the usual mode of reckoning we live in the Quaternary Age which was preceded by the Tertiary. These terms in simpler language signify the Age of Man and the Age of Mammals, respectively. The Quaternary has the subdivisions Recent and Pleistocene; the Tertiary splits into Pliocene, Miocene, Oligocene, and Eocene.

The Tertiary is estimated to have lasted three times the duration of the Quaternary to date. Primate forms, or monkeys, appear in the Eocene, but it is not until the Pleistocene that forms closely approximating the human are found. For an account of the discoveries down to 1914, see the article MAN, SCIENCE OF, in VOL. XIV. In the decade 1914-24, we find the one outstanding discovery in the Old World to be that at Broken Hill, Rhodesia, Africa, in 1921. In this case, a large part of the skeleton was found, and fragments from the skeleton of at least one other individual. The brain case seems to be low-vaulted and indicative of low cranial capacity. The most striking feature, however, is the very large gorilla-like face. The teeth are large and the jaws massive. Even the Heidelberg jaw, truly massive, is inferior to that of the Rhodesian skull.

The skeleton, on the other hand, suggests an erect posture and straight legs similar to modern man. So just where this type will fall in relation to earlier finds remains to be seen, nor is it yet possible to state with exactness its geological age. Yet one important point is clear; viz., that this is one of the extinct forms of man and that it was found outside of Europe, thus extending the range of these early forms over Africa. Again, the face of this skull is the most primitive yet discovered, at least the most like the larger anthropoids.

Although *Pithecanthropus erectus* was discovered in 1891 by Dubois, the specimens were not made accessible to students until 1923. In consequence, they have been very carefully studied by a number of specialists, working independently. It appears that the brain capacity at first was somewhat underestimated; it was later rated at 985 cubic centimeters, which brings it much nearer the human level. It also became known for the first time that Dubois procured part of a lower jaw with teeth, which because of its location must be considered part of another individual, but apparently belonging to the same genus. The net result of this new information is to give added certainty to the existence of this genus and to increase the possibility of a Tertiary precursor who was able to begin the development of tools.

The outstanding event in this connection was the study of the Piltdown finds (see MAN, SCIENCE OF, in VOL. XIV). The discovery was made by Dawson, but the study of the skull and the subsequent excavation of the site was carried on by Smith-Woodward, a well-known scientist. The skull was incomplete: part of the brain case, portions of the face, some teeth and half of a lower jaw. With these in hand a satisfactory reconstruction has been made, indicating a high or modern skull capacity, but a rather thick skull. The lower jaw, however, is decidedly

simian in appearance and so are the teeth, so much so that for a time some students regarded the jaw as not human and not belonging to the skull. The doubters were chiefly Americans, whereas English specialists who had better opportunities of examining the original specimen have consistently maintained that the jaw was not only human, but that it belonged to the same individual as did the skull. The chief difficulty throughout has been the inconsistency of a highly developed brain case, associated with an extremely primitive jaw, but this is no longer regarded as impossible or contrary to the evolutionary view.

A careful study of the specimen was made by G. Elliot Smith and Smith-Woodward, comparing it point by point with the other extinct types. For one thing, they assumed that since speech and handwork are the outstanding characteristics of modern man, these extinct types should show a marked development in the lateral portions of the brain case, under which are found the parts of the brain most intimately concerned. It is generally believed, for instance, that it was the expansion in this part of the brain case among the anthropoids that resulted in the modern type of human brain and head. When the subject is approached in this comparative way, all the cranial characters of the several extinct types of man fall readily and consistently into a series: first, *Pithecanthropus erectus*; next, Heidelberg man; then, in order of ascending development, the Rhodesian man, the Piltdown, the Neanderthal, and so on to modern man. The latest find of the period was made about two miles from the original Piltdown site. In this instance there came to light two fragments of the brain case and a molar tooth. One fragment, at least, overlaps one of the first find, so two individuals are represented. The tooth proves to be a molar from the lower jaw. The condition of these bones, the strata in which they were found, etc. are all in close agreement with the original Piltdown find; hence, there can be little doubt that in this totality the Piltdown finds represent two individuals of the same species. The significance of this last find is great, since it adds to the certainty that in the original the jaw and skull belong together. It has been almost impossible to come to a definite decision as to the geological position of the Piltdown find, because it lay near the surface in a slightly jumbled formation; yet the evidence favors the third interglacial period. This would, in fact, be consistent with the developmental sequence given above.

Turning now to new finds on the continent of Europe, we have only repetitions of Neanderthal and Cro-Magnon, nothing distinctively new. However, one of the recent finds promises to throw new light on the origin of modern man. It will be recalled that the first modern type of man to appear in Western Europe is that known as Cro-Magnon, first definitely associated with the palæolithic period by the discovery of a skeleton in the famous station of Solutré in 1868. Since that date similar skeletons have come to light, but in 1923 at the same station of Solutré, a new find was made by Depéret, Arcelin, and Mayet. In this case five skeletons were found. The burials had been made in an orderly manner and the graves marked with upright headstones. The artifacts accompanying these burials were considered of Aurignacian age. In stature these

individuals were tall, estimated at about 6 feet 5 inches. Perhaps the most important point of interest is that these skeletons represent a type of man rather more modern than the established Cro-Magnon type in that the faces are not so broad and the heads not pronouncedly dolichocephalic. This gives us at the first appearance of this type a less individualized example of the Cro-Magnon type, particularly in that the faces are not so wide, or like those of the American Indians, and so "disharmonic," since the head was not correspondingly narrow. All this raises the interesting question whether this latest find is a later form of this type and in consequence the ancestor of the white races of western Europe, or whether the disharmonic type was a later, more generalized and perhaps hybridized form which was eventually displaced.

There is, however, one possible exception to the statement that no earlier new forms were found upon the continent of Europe, since in 1914 the lower jaw of an adult was found at Ehringsdorf not far from Weimar and recently an incomplete skeleton of a child of approximately 10 years. In the opinion of some, these represent a type that belongs to a more remote period than the Neanderthal, seemingly most clearly resembling the Piltdown specimen. Finally, mention should be made of the skeleton of a Neanderthal child discovered by Dr. Henry Martin at the station of La Quina. In this specimen the distinctively Neanderthal characters are fully pronounced, giving additional proof that the differentiation between Neanderthal and modern man is fundamental.

So far we have considered only Europe and Africa because with the single exception of *Pithecanthropus erectus* there have been no distinctive finds elsewhere. It does not follow, of course, that there will be none such, because both in Asia and America there have not been wanting signs of fair antiquity, but merely that they have not come to light. It is true that finds of great antiquity are frequently reported in the American press, but these have all failed to stand the examination. At least, so far no primitive remains have been found in the New World that would in any way compare with the Neanderthal. The inference therefore is that while man may have been in the New World for a very long time, he came here from the modern level. Differences in age, then, for ancient man in America must be determined largely by geological and archaeological criteria. However, there have been a number of finds whose claims to antiquity have not been completely demolished. Among these the most significant is that in Los Angeles, Cal., where early in 1924 fragmentary human remains and a few artifacts were found in strata that appeared to date back to the very beginning of the modern epoch, if not, in fact, the vanishing stage of the Pleistocene. It has, however, proved impossible to determine the precise geological horizon for this deposit, and since no associated fauna were found, the age of these remains is still doubtful. The skeletal features, on the other hand, are similar to those of California Indians.

Perhaps the greatest interest in this subject centres in the immediately prehuman types, one of which promises to be the fossil apes of the genus *Dryopithecus*, for some time known by fragmentary examples. In Europe, at least, *Dryopithecus* seems to have lived in the upper Miocene which would place this form on the

line of differentiation between the tree-living and the ground-living primates. Specifically, *Dryopithecus rhenanus*, the form known in Europe, is of large size and in a number of morphological characters lays strong claims to the rôle of man's precursor. In size it compares favorably with the gorilla, and in dentition it shows clearly the basic human tooth patterns. Again in 1923, Barnum Brown, a well-known palaeontologist, from the American Museum of Natural History in New York, discovered parts of three jaws in the Siwalik Hills, India, which prove to belong to one or more species of *Dryopithecus*. The significance of this discovery is that the range of this genus corresponds to that of the primitive forms just discussed, *Pithecanthropus* in Java, the Heidelberg man in Europe. One might then draw upon a map of the world a line from Australia to England and consider this the axis to the distribution area for primitive man and his precursors, at least insofar as our knowledge goes.

Even in the New World traces of a large anthropoid primate have come to light. President Henry Fairfield Osborn of the American Museum in New York announced in 1922 the discovery of a molar tooth from fossil beds near Agate, Neb. In fact, this specimen was found by Harold J. Cook, an experienced geologist and palaeontologist, while exploring fossil beds in the locality noted above. An exhaustive study of this tooth has been made by W. K. Gregory and Milo Hellman, the outcome of which supports the original determination of Professor Osborn that the finding of this tooth indicates the presence in the world of a new form of higher primate, falling between *Dryopithecus* on the one hand and *Pithecanthropus* on the other. Accordingly, the name *Hesperopithecus* has been assigned to this new type. The geological and palaeontological setting of the deposit from which the tooth came suggests Upper Miocene or Lower Pliocene, and this again, on mere chronological grounds, places *Hesperopithecus* between *Dryopithecus* and *Pithecanthropus*.

The general significance of these discoveries lay in not only their revealing an ancient world-wide range for the higher primates, but in their supplying the intermediate structural forms needed to complete the evolutionary outline.

**MAN.** SCIENCE OF. See ANTHROPOLOGY; ETHNOGRAPHY; ETHNOLOGY; MAN, PREHISTORIC RACES OF.

**MANCHURIA.** A Chinese outer territory, with an approximate area of 363,700 square miles. Population estimates varied from 5,750,000 to 29,400,000. The most recent estimate, that of the Southern Manchuria Railway, put the population at 20,112,100, of whom nearly 90 per cent were Chinese. The capital and chief town, Mukden, had 158,132 inhabitants; the chief post was Dairen. Other large towns were Harbin (365,000), Newchwang (82,100), Kirin (540,214), Ying-k'ou (60,000), and An-tung (57,699). The extraordinary fertility of the soil and the improved railway facilities caused Manchuria to grow more rapidly than any other section of China. In 1921, it was estimated that 22,744,505 acres of land were under cultivation, worked by 19,461,100 people. The soya-bean, millet, kaoliang (a sort of sorghum), wheat, and rice were the principal crops. From 1912 to 1920, the kaoliang output increased from 3,807,740 to 6,733,000 tons; millet from 2,309,800 to 5,128,900 tons; barley from 364,369 to

1,552,000 tons. In 1910, 350,000 tons of soya-beans were exported; in 1920, 550,000 tons. In 1910, 250,000 tons of bean cake were exported; in 1920, 1,120,000 tons. Some idea of the advances made in mineral production may be gathered from the fact that coal mined in the Fushun mines, operated by the South Manchuria Railway, increased from 1,343,198 tons in 1911 to 3,237,400 tons in 1920. Gold, iron, salt, natural soda, and magnesite were also worked to some extent. The constant application of the principal concessionaire in the country, the South Manchuria Railway, to industrial activities met with excellent results. Whereas in 1907 there had been only 77 factories in the Kwantung leased territory, capitalized at 1,924,174 yen and turning out products valued at 2,681,868 yen, by 1918 there were 197 factories capitalized at 41,722,501 yen and producing 111,194,323 yen in commodities. Similarly, factories in the railway zone increased from 41 (capital, 2,448,265 yen) in 1912, to 131 (capital, 33,736,311 yen) in 1918. Principal works were bean mills, flour mills, sugar refineries, distilleries, and iron and steel factories. The trade of Manchuria reflected the same condition. Imports of foreign goods steadily increased from 72,431,345 taels in 1913 to 136,926,411 in 1921; exports from 94,053,423 to 196,820,680 in 1921. The following table shows exports from Dairen, in tons:

|                   | 1908    | 1914    | 1920      |
|-------------------|---------|---------|-----------|
| Beans .....       | 182,629 | 255,112 | 567,129   |
| Bean cake .....   | 204,627 | 512,823 | 1,131,208 |
| Cereals .....     | 13,781  | 118,259 | 707,237   |
| Coal .....        | 7,703   | 559,761 | 212,589   |
| Sundries .....    | 28,646  | 98,518  | 278,935   |
| Bunker coal ..... | 15,276  | 247,193 | 195,428   |

The increasing rôle played by the United States in the Manchurian trade may be adduced from the following: imports from the United States for 1910, 1919, and 1920, \$1,212,582, \$27,678,116, and \$15,871,554; exports for 1910, 1919, and 1920, \$8671, \$14,474,853, and \$16,514,377. The decline in 1921 (exports dropped to \$6,523,319) was due to the worldwide depression. The growth of the port of Dairen reflected the general advance. In 1908, 1357 vessels of 1,829,921 tons entered; in 1920, 2942 vessels of 4,864,904 tons; in 1921, 4592 of 6,328,734 tons. In 1920, American tonnage entering was 381,729, as compared with 421,028 British, and 3,408,369 Japanese. The increasing value of silver over the period 1914-24 necessarily contributed to the general well-being. From 1908 to 1915 the average value of the tael was \$0.67. In 1922 it was reported that more than 2220 miles of railway were in operation. These belonged to the following systems: South Manchuria Railway, 686 miles; Chinese Government Railways, 522 miles; railways under Russo-Chinese management, 1078 miles. For history see CHINA; JAPAN.

**MANDATES.** The decision of the Paris Peace Conference (see PEACE CONFERENCE AND TREATIES) to establish a mandatory system under supervision of the League of Nations instead of permitting the outright annexation of the former German colonies and Turkish territories by the victorious Allies, resulted in the creation of a very significant and novel form of international control over colonial possessions. Colonies with an aggregate area about 1,250,000 square miles

and a total population of more than 15,000,000 were placed under mandates of the League of Nations, and well-informed observers have predicted that the system will ultimately be extended to other colonies. Article 22 of the Covenant which was prefaced to the five major peace treaties provided that certain territories taken from the defeated powers and "not yet able to stand by themselves" should be administered by more civilized nations acting as "mandatories" or trustees for the League of Nations, in which, presumably, ultimate sovereignty is vested. There were to be three classes of mandates: Class A, including territories taken from Turkey; Class B, including former German colonies in central Africa; and Class C, comprising German Southwest Africa and the former German island possessions in the Pacific. The principal Allied and Associated Powers, to whom these areas were ceded by Turkey and Germany, reserved the right to distribute the territories in question, and to draft the mandates, before turning the system over to the League for permanent operation. Accordingly, the Supreme Council on May 7 distributed the B and C mandates as follows: German East Africa to Great Britain, Togoland and the Cameroons (q.v.) to Great Britain and France, Southwest Africa to the Union of South Africa, Samoa to New Zealand, Nauru to the British Empire, German New Guinea to Australia, and German islands north of the equator to Japan.

There remained the A mandates. Because of the uncertainty regarding the Turkish peace settlement, these were not distributed until the San Remo conference of premiers in April, 1920. The San Remo decision, confirmed on May 5, allotted Syria to France, and Palestine and Mesopotamia to Great Britain. It had been intended that Armenia also should become an A mandate, but as neither the United States nor any other power cared to assume responsibility for Armenia's welfare, no mandate was issued (see ARMENIA).

As the premiers at San Remo not only assigned the mandates but also sealed a compact for exclusive Anglo-French exploitation of the oil resources in Mesopotamia, the United States government immediately addressed a note of protest, May 12, 1920, to Great Britain, insisting on equal treatment for subjects of all nations. Refusing to be referred by Lord Curzon to the Council of the League (Curzon letter of August 9), the Washington government insisted on Nov. 20, 1920, that the drafts of mandates must be communicated to it for criticism before final approval, and that the United States had a just claim to all privileges, in regard to mandates, enjoyed by members of the League. The first point, it may be noted, was satisfied subsequently by preliminary publication of draft mandates; the second was guaranteed by special treaties which the United States later negotiated with individual mandatory powers. The United States also objected to the assignment of Yap (q.v.) to Japan, and not until the Washington Conference (q.v.) was this dispute settled by a special treaty recognizing the Japanese mandate for assuring the United States of cable and wireless facilities.

Meanwhile work proceeded on the drafts of the mandates, for each mandated territory was to be entrusted to the mandatory power only on a conditional basis laid down in a separate

charter or mandate, drafted by the chief Allied powers, but approved and granted by the League Council. The C mandates, offering the least difficulty, were first formulated and received the Council's stamp of approval on Dec. 17, 1920. These were five in number: Union of South Africa mandate for former German Southwest Africa, Australian mandate for New Guinea, New Zealand mandate for western Samoa, British Empire mandate for Nauru Island, and Japanese mandate for the Caroline and Marshall Islands. In each of these territories the mandatory power was authorized to exercise full power of administration and legislation, subject to reservations for the prohibition of slavery and forced labor, of the arms and liquor traffic, of fortifications and military training of natives save for local defense, and subject also to a guarantee of religious freedom. Japan would gladly have added a provision for the open door, but the other powers, especially the Australasian Dominions, unwilling to throw their Pacific mandates open to Japan, refused. Difficulties with the Holy See regarding the Palestine mandate, and with the United States regarding Mesopotamia, delayed the definitive approval of the other mandates. On Aug. 1, 1922, the Council approved B mandates for northern Cameroon (British), southern Cameroon (French), western Togoland (British), eastern Togoland (French), Ruanda and Urundi (Belgian), and East Africa or Tanganyika Territory (British). A notable feature of these mandates was the inclusion of elaborate provisions for the welfare of the natives, the abolition of slavery, and equality of commercial and industrial opportunity in these territories among members of the League, in addition to the stipulations contained in the C mandates. The A mandates for Palestine (British) and Syria and Lebanon (French) were approved on July 24, 1922, and published by the League on August 12; that for Mesopotamia had long been drafted but had aroused so much international difficulty and was so vitally dependent on British relations with the natives that its confirmation was delayed (see MESOPOTAMIA.) The A mandates were particularly interesting; they were designed to be transitional measures to assist backward countries until fit for independence. Special provisions were inserted for the development of autonomy and for the protection of "antiquities" or archaeological remains.

All mandates imposed on the mandatory power the obligation to make regular reports of its administration to a Permanent Mandates Commission appointed by the League. This is undoubtedly the most unusual and the most valuable feature of the entire system; the knowledge that such reports will receive full publicity and open discussion has acted as a potent stimulus to good administration. Under the direction of Professor Rappard a special section of the League secretariat at Geneva has made a most thorough study of the voluminous reports, in order to provide the commission with some authoritative data. Two instances of the work of the Mandates Commission may illustrate the value of this work. At the 1922 meeting it developed that the frontier between the Belgian and British mandates in East Africa caused considerable hardship to the natives, because it was drawn regardless of tribal frontiers; in consequence of the Commission's recommendation, Belgium and Great Britain agreed to mod-

ify the frontier. Again, the imposition of a heavy dog tax on natives of Southwest Africa caused the Bondelzwarts rebellion of 1922, which was ruthlessly suppressed by the Union of South Africa; a Haitian delegate brought the matter before the Commission, and South Africa was severely criticized for its native policy, with the result that the policy was modified. Full information regarding the mandates and their administration is made available by the League of Nations in its publications containing minutes of the Mandates Commission and supplementary official documents. See AFRICA; LEAGUE OF NATIONS.

**MANGIN**, CHARLES MARIE EMMANUEL (1866- ). A French soldier, born in Sarrebourg, Moselle. He served on the staff of Marchand's Fashoda mission in 1897 and played a prominent part in the conquest of Morocco from 1911 to 1913. In the latter year he was made brigadier-general. In the great War he commanded a division at the battle of the Marne and by his personal example of courage saved a threatening situation. He commanded at Verdun, where in March, 1916, he recaptured the fortresses Douaumont and Vaux. In the defensive of April, 1917, his tactics were criticized and an inquiry was held. He was exonerated. In July, 1918, he defeated the Germans north of Château-Thierry and forced them to retreat. During these operations he had under his command important American forces. Following the Armistice, he commanded the Allied Army of Occupation, with headquarters at Mayence. He was the organizer of the French "black army."

**MANITOBA.** A Canadian province with an area of 251,832 square miles; population in 1911, 461,394; in 1921, 610,118, an increase of 32.2 per cent. The rural population in 1921 made up 57.1 per cent of the whole, as compared with 56.6 per cent of 1911. Males, in 1921, continued in excess of females, the division being 320,567 to 289,551. The leading cities, with their populations in 1921, were Winnipeg, the capital, 179,087 (136,035 in 1911); Brandon, 15,397; St. Boniface, 12,821; Portage la Prairie, 6766. In 1916 settlers of American origin numbered 18,274. There were, besides the settlers of British descent, large colonies of German, Austro-Hungarian, and Russian farmers in the province.

**Industry.** To a large extent, the province's very rich natural resources remained undeveloped. The population was settled in the agricultural districts of the West and South, and as farming and pastoral pursuits were the leading activities, little attention was given to the forests, fishing grounds, water power, or mineral deposits. The characteristic of the period was the spread of diversified farming. The area under field crops in 1923 was 6,719,522 acres. The acreage under spring wheat in 1923 (2,915,915 acres) was less than that of 1911 (3,094,833 acres). Oats in 1922 were planted on 1,834,504 acres. Barley, rye, flax, and root crops showed considerable increases, and so did the forage crops. The total value of field crops in 1923 was \$60,706,700. The augmentation of the live stock indicated the new interest of the province. Cattle in 1923 numbered 691,711, against 409,718 in 1913; sheep in 1923 were 93,162, against 42,840 in 1913; swine in 1922 were 291,236 against 184,745 in 1913. In 1922, 51 dairy establishments produced a product

value of \$12,434,233 as against the total output of \$593,375 in 1910. Mineral areas included rich gold fields in The Pas district and at Elbow Lake; copper ore in the Flin Flon district; gypsum, and building materials. The total mineral production in 1922 was \$2,258,942. Other products yielded: furs, 1921-22, more than \$1,690,278; fish in 1921, \$1,023,187; lumber cut, 1921, \$1,398,067. In 1921 there were 1965 industrial establishments; meat packing, milling, etc., was the most important, capitalized at 100,441,542 and employing 20,732 workers (17,325 in 1910). Materials used were valued at \$68,216,070 and the product at \$123,470,393; in 1910 the product had been \$53,673,609. Out of the 3,270,491 horse power estimated as available, in 1923, 134,025 was being used.

**Communications.** In 1922 there were in operation 4585 miles of railway as compared with 3993 miles in 1913. The telephone system, provincially owned, had 240,186 miles of line in 1921. There were 68,463 telephones on the lines, 14,956 of which were rural. The Dominion railway from The Pas to Port Nelson (Hudson Bay), to make possible wheat shipments via Hudson Bay, was still under construction.

**Government.** Revenues and expenditures for 1913 were \$5,788,070 and \$5,314,849; for 1922, \$7,940,457 and \$8,381,667. The gross debt in 1922 was \$62,000,000, of which 75 per cent had been expended in the telephone system, public buildings, and roads. The Dominion subsidy for 1922 was \$1,470,991, and receipts from Dominion school lands, \$286,346. In 1922 there were 136,876 pupils in the 3782 public schools. The enrollment had been 83,679 in 1913. The University of Manitoba had 1570 students in 1921; the Agricultural College, 1124 students. The provincial budget in 1922 carried \$1,399,759 for education; in 1913, this had been \$668,832. Total expenditures for education in 1913 were \$5,036,795; in 1922, \$13,564,824. The province was represented by six members in the Senate and 15 in the House of Commons of the Dominion Parliament. Women were permitted to stand for Parliament. Proportional representation was adopted as the method for choosing the representatives for the city of Winnipeg.

**MANLY, CHARLES MATTHEWS** (1876- ). An American mechanical engineer, born at Staunton, Va., and educated at Furman University and Cornell. After graduation he became assistant to Secretary Langley of the Smithsonian Institution in his work on aviation and built and piloted the first Langley aeroplane in 1903. He organized the Manly Drive Company in New York in 1905 and was its chief engineer, thereafter serving as consulting engineer to various corporations and to the British War Office (1915) in the development of large aeroplanes in the United States. During 1915-20 he was associated with the Curtis Aeroplane and Motor Corporation but later devoted his attention chiefly to consulting practice under Manly and Veal. He patented nearly 50 inventions in automotive transportation, power generation, and transmission. In 1918 he was a member of the United States Commission to the International Aircraft Standards Conference in London. He was associated with S. P. Langley in the production of his *Memoirs on Mechanical Flight* (1911).

**MANN, ALBERT RUSSELL** (1880- ). An American agricultural educator, born at Haw-

kins, Pa., and educated at the New York State College of Agriculture and the University of Chicago. In 1908 he was appointed assistant professor of dairy industry at New York State College and in the same year was secretary of the State Commission of Agriculture. He was successively secretary, registrar and editor, professor of rural social organizations, acting dean, and dean (from 1917) of the New York State College of Agriculture. He was also director of the Cornell University Agricultural Experiment Station and director of extension work. He was a member of many scientific societies and the author of *Beginnings in Agriculture* (1911).

**MANN, JAMES ROBERT** (1856-1922). An American legislator (see VOL. XV). He was reelected to Congress for successive terms from 1903 to 1923. He was minority leader from the 62nd to the 65th Congress and was Republican leader up to the time of his death. He was recognized as one of the most efficient parliamentarians in the House and was perhaps its most conspicuous member for many years. He was a candidate for Speaker in 1922 but was defeated by Fred H. Gillett of Massachusetts.

**MANNING, WILLIAM THOMAS** (1860- ). A Protestant Episcopal bishop (see VOL. XV). He was rector of Trinity parish from 1908 to 1921. In the latter year he was consecrated bishop of New York. During the War he served as volunteer chaplain at Camp Upton. He was a chevalier of the Legion of Honor of France and an officer of the Order of the Crown of Belgium. From 1922 to 1924 he was much in the public eye on account of controversies with the Rev. Percy Stickney Grant, because of his radicalism, and with the Rev. William Norman Guthrie, because of dancing and other innovations at his religious services in St. Marks-in-the-Bouwerie, New York City.

**MANOURY, MICHEL JOSEPH** (1847-1923). A French general, born at Maintenon, and educated at the Ecole Polytechnique in Paris. He served in the Franco-Prussian War of 1870 and was general of a division in 1905. In the latter year he received the command of the artillery of the forts of Paris and was president of the Commission of Military Schools. He commanded the 14th Army Corps at Marseilles in 1908 and the 20th at Nancy in 1909; in 1910 he was appointed military governor of Paris and a member of the special council of war. In 1914 he was placed in command of the French Reserve Force near Paris, and it was his successful attack on September 6 which first checked General Von Kluck's drive toward Paris. He was wounded at Soissons in March, 1915. He died at Orléans, France, in 1923.

**MANSFIELD, KATHERINE** (c. 1890-1923) (MRS. JOHN MIDDLETON MURRY). An English writer, born in New Zealand. She began writing at an early age and soon won her way to the front rank among contemporary writers of fiction. In 1913 she married John Middleton Murry. Her book of short stories, *Bliss and Other Stories*, published in 1920, won much favorable comment. This was followed by *The Garden Party and Other Stories* (1922). A posthumous book of poems was published in 1924.

**MANSHIP, PAUL** (1885- ). An American sculptor, born in St. Paul, Minn. He studied art in New York and Philadelphia, and in 1909, winning a scholarship of the American

SCULPTURE

FROM THE METROPOLITAN MUSEUM OF ART, NEW YORK

"PAULINE"

PAUL MANSHIP

THE LIBRARY  
OF THE  
UNIVERSITY OF ILLINOIS

Academy in Rome, he went to Europe for three years. In Europe he studied the work of Michelangelo and Donatello and found inspiration in Greek art. He was also influenced by the art of India. His debt to Greece may be traced in such pieces as "The Centaur and the Dryad," "Briseis," the "Infant Hercules" fountain made for the courtyard of the American Academy at Rome, "The Lyric Muse" and "The Little Brother." The beautiful patina of these pieces is a peculiarity of Manship's work. His gleanings from Hindu and Buddhist sculpture are seen in "The Dancer and Gazelles" and the "Flight of Night." While there is reverence for tradition in Mr. Manship's sculpture, there are also very modern notes in some of his figures, e.g., "Yawning." In 1914 he was elected an Associate of the National Academy; two years later he was made a full member. Among his works are the J. P. Morgan memorial at the Metropolitan Museum in New York City; the Civic Forum medal; and "Dancing Girl and Fauns" and "Indian and Prong-Horn Antelope" at the Art Institute, Chicago. The bronze statuette, "Yawning," is at the St. Paul Institute, and the portrait study of his daughter, "Pauline," is in the Metropolitan Museum. The group, "Dancers and Gazelles," was exhibited at the Luxembourg in Paris and also at the Corcoran Art Gallery, Washington and the Cleveland Museum. Copies of "Centaur and Dryad" are at the Metropolitan and at the Detroit Institute of Arts.

**MANTLE, BURNS** (1873- ). An American newspaper writer, born in Watertown, N. Y. He became dramatic editor of *The Daily News* (New York) and dramatic correspondent of the *Chicago Tribune* in 1922. He was previously dramatic editor of *The Evening Mail* (New York) and Sunday editor of the *Chicago Tribune*. He was best known as the editor of *The Best Plays and Year Book of the Drama in America* (from 1919).

**MANUFACTURES.** See **BOOTS AND SHOES**; **IRON AND STEEL**; **LEATHER**; **MOTOR VEHICLES**; **PAPER AND WOOD PULP**; **PETROLEUM**; **RUBBER**; **SILK**; **SILK, ARTIFICIAL**; **TEXTILE MANUFACTURING**; **UNITED STATES, Manufactures**.

**MANURES.** See **FERTILIZERS**.

**MANZ, GUSTAV** (1868- ). A German writer and editor of the *Tägliche Rundschau* of Berlin. He was a popular lecturer and was on the staff of the Lessing Hochschule of Berlin. He is the author of *M. Beer* (1892); *Das Tagebuch* (1893); *Das Lebende Wort* (1913); *Hundert Jahre Berliner Humors* (1916); and *Martin Luther im Deutschen Wort und Lied* (1917). He also edited Emil Gött's *Verbotene Früchte* (1894) and *Briefe an einen Freund* (1919), works by Möricke (1912), Scheffel's *Ekkehard* (1916), *Selected Writings of Theodor Storm* (1917), and Friedrich Vischer's *Auch Einer*.

**MARCH, PEYTON CONWAY** (1864- ). An American soldier, born in Easton, Pa. He graduated from the United States Military Academy in 1888 and in the same year was commissioned 2d lieutenant in the artillery. He saw service in the Philippines in military operations and later as administrator. From 1903 to 1907 he was a member of the General Staff in the Army and in 1904 was observer in the Russo-Japanese War. He commanded the artillery branch of the American Expeditionary Forces from the outbreak of the War until 1918, when he was appointed acting chief of staff.

On May 20, 1918, he became general and chief of staff and held that position throughout the remainder of the War. He was awarded the Distinguished Service Medal and decorations of England, France, and other European countries.

**MARCONI, GUGLIELMO** (1874- ). An Italian electrical engineer (see Vol. XV). During 1922-24 he was experimenting on new methods of transmission by which energy might be centralized in one direction and made to go in a straight line from one station to another. He made successful experiments in sending radio messages from Cape Verde to Cornwall, a distance of 2200 miles. During 1924 he was successfully experimenting with the reduction of power required for transmission of radio messages. See **RADIO TELEGRAPHY AND TELEPHONY**.

**MARCOSSON, ISAAC FREDERICK** (1877- ). An American editor, born at Louisville, Ky., and educated in the schools of Louisville. From 1894 to 1903 he was on the staff of *The Louisville Times*. In 1903 he became associate editor of *The World's Work*, with which he continued until 1907, when he became a member of the staff and financial editor of the *Saturday Evening Post*. From 1910 to 1913 he was editor of *Munsey's Magazine*. During and following the War he traveled about Europe and other parts of the world to investigate conditions and contributed articles to the *Saturday Evening Post* and other periodicals. He wrote: *The War After the War* (1916); *The Rebirth of Russia* (1917); *The Business of War* (1917); *Adventures in Interviewing* (1919); and *An African Adventure* (1921). He was the author, with Daniel Frohman, of *Charles Frohman, Manager and Man* (1917).

**MARIANNE or LADRONE ISLANDS.** See **PACIFIC OCEAN ISLANDS**.

**MARIENWERDER.** See **ALLENSTEIN-MARIENWERDER**.

**MARIETTA COLLEGE.** A nonsectarian, coeducational institution at Marietta, Ohio, founded in 1835. The enrollment of the college increased from 200 in 1914 to approximately 310, exclusive of extension students, in 1923-24. The faculty increased during the period 1914-24 from 19 to 26, the library from 60,000 to 84,500 volumes, and the productive funds from \$700,000 to \$1,120,000 through an endowment campaign in 1921. A department of geology was established in 1919, and the entrance requirements were raised in the fall of 1922. Edward Smith Parsons succeeded G. W. Hinman as president in 1919.

**MARINE, MERCHANT.** See **SHIPPING**; **SHIP-BUILDING**; etc.

**MARINE CORPS, UNITED STATES.** During the great War the Marine Corps served on vessels of the fleet, and on shore in France, Haiti, Santo Domingo, Nicaragua, Cuba, Peking, the Azore Islands and at naval stations at home and abroad. The Fourth and Fifth Brigades of marines and 12 replacement battalions served with the American Expeditionary Forces in France, and the First Marine Aviation Squadron with the northern bombing group in France.

The Fifth Regiment of Marines landed in France with the first expedition of American troops in June, 1917; with the Sixth Regiment of Marines and the Sixth Machine Gun Battalion of Marines it formed the Fourth Infantry Brigade of the Second Division, United States Army. This division was the first one ready

for service on the fighting line, and the remarkable work of the Fourth Brigade of Marines around Château-Thierry and in Belleau Wood gave the Corps world-wide fame. The regular strength of this brigade was 258 officers and 8211 enlisted men. During its service in France, chiefly between March 15, and November 11, 1918, its casualties were:—killed in action or died of wounds received in action, 2457; wounded, 8898; total, 11,355, almost 3000 more than the total number of officers and men at any one time. The authorized strength of the Corps in 1924 was 1093 commissioned officers, 158 warrant officers, and 19,500 men.

**MARINE ENGINES.** See SHIPBUILDING.

**MARINUZZI, GINO** (1882– ). An Italian conductor and composer, born at Palermo. After completing his studies at the Conservatory in Palermo he was conductor at various theatres in Italy and made frequent appearances as guest conductor in Paris, Madrid, and Buenos Aires. From 1919 to 1921 he was with the Chicago Opera Association. In 1922 he became principal conductor at the Teatro Regio in Turin. He composed the operas, *Il Sogno del Poeta* (Palermo, 1889), *Barberina* (ib., 1903) and *Jaquerie* (Buenos Aires, 1918; Chicago, 1920). He also wrote a symphonic poem, *Sicania*, and an orchestral suite, *Siciliana*.

**MARITIME REPUBLIC.** See SIBERIA AND THE FAR EASTERN REPUBLIC.

**MARKETING.** See AGRICULTURE, HORTICULTURE.

**MARNE, BATTLES OF THE.** See WAR IN EUROPE, *Western Front*.

**MARQUESAS ISLANDS.** See PACIFIC OCEAN ISLANDS.

**MARQUETTE UNIVERSITY.** An institution under Roman Catholic direction at Milwaukee, Wis., founded in 1907. The student enrollment increased in the decade between 1914 and 1923–24 from 1187 to 3925, of which 330 were women. The number of members in the faculty rose from 254 to 330, and the number of volumes in the library from 30,000 to 75,000. In 1918 the university received \$333,333 from the Carnegie Foundation and in 1922 \$800,000 under the will of Mrs. Harriet Cramer. A gymnasium and a new building for the College of Dentistry were built, and a new science building and law building were under construction in 1924. Rev. Albert C. Fox, S.J., LL.D., succeeded the Rev. Herbert C. Noonan, S.J., MA, as president in 1922.

**MARQUIS, DON (ALD ROBERT PERRY)** (1878– ). An American newspaper writer and author, born at Walnut, Ill. For several years he was associated with Joel Chandler Harris in editorial work in Atlanta, Ga. Moving to New York, he wrote the *Sun Dial* column in the New York *Evening Sun*. In its conduct he achieved a distinctive reputation as a wit and philosopher. He gave it up to become director of a column in the New York *Tribune* in 1923. His writings include: *Hermione* (1916); *Prefaces* (1919); *The Old Soak*, a play (1921); *Carter and Other People* (1921); *Noah an' Jonah an' Cap'n John Smith*, poems (1921); *Poems and Portraits* (1922); *Revolt of the Oyster* (1922); *Sonnets to a Red-haired Lady* (1922); and *The Old Soak's History of the World* (1924).

**MARRIAGE.** See EUGENICS.

**MARSAL, FRÉDÉRIC FRANÇOIS** (1874– ).

A French politician, born in Paris, and educated at the French universities. He pursued a military and political career. Recipient of many decorations, he wrote numerous books on finance and political economy. He was minister of finance in the governments of Millerand, Leygues, and Briand (1920–22) and again in 1924 in the reorganization of the Poincaré cabinet. He floated the great peace loan of 1920 and took measures to consolidate the floating debt of the French Republic, which in 1924 amounted to 70,000,000,000 francs. After the Radical victory in the 1924 elections, Marsal was chosen by President Millerand to read his message to Parliament, but the Radical majority in the Chamber refused to accept any cabinet named by the nationalistic French president.

**MARSEILLES-RHONE CANAL.** See CANALS.

**MARSHALL, LOUIS** (1856– ). An American lawyer and publicist (see VOL. XV). He took part in many arbitrations and mediations between employers and laborers and was a member of the arbitration board which settled the New York clothing workers' strike in 1919. He was also chairman of the commission to fix the price of bread and secured the enactment of laws regulating private and foreign bankers and other reform legislation. In 1920–21 he was president of the Jewish Relief Committee which collected more than \$50,000,000 for relief of Jewish war sufferers. He was also a member of the international committee whose efforts resulted in treaties with Poland, Rumania, Jugo-Slavia, Czecho-Slovakia, and other countries, to guarantee equal rights to racial, religious, and linguistic minorities.

**MARSHALL ISLANDS.** See PACIFIC OCEAN ISLANDS.

**MARTIN, EVERETT DEAN** (1880– ). An American sociologist, born at Jacksonville, Ill., and educated at Illinois College in Jacksonville and at McCormick Theological Seminary. In 1907 he was ordained to the Congregational ministry and served as pastor in several churches in Illinois. From 1910 to 1914 he was pastor of the Unitarian church in Des Moines, Iowa, and from 1916, lecturer on social philosophy at the People's Institute, New York. He was assistant director and secretary from the latter year of the Cooper Union Forum and acting director in 1921–22. He founded the People's School of Philosophy, lectured on social psychology at the New School for Social Research (1922), and was chairman of the National Board of Review of Motion Pictures. His book, *The Behavior of Crowds* (1920), attracted attention.

**MARTIN, GLENN L.** (1886– ). An American airplane manufacturer, born at Macksburg, Iowa. In 1907 he began to build gliders and in the next year designed and built the pusher type of airplane. In 1909 he established one of the first airplane factories in the United States and built monoplanes, water aircraft, etc. He gave many exhibition flights in Canada and the United States and in 1912 moved his factory to Los Angeles. The War Department ordered his model *TT* in 1913, and later the Army adopted it for training purposes. From 1914–16 he built for the government of Holland and produced several new models for the United States Army. In 1917 he organized his own company at Cleveland and began designing and building the Martin

bomber, the first American-designed airplane for Liberty engines.

**MARTIN, HELEN REIMENSNYDER** (1868- ). An American author (see VOL. XV). Her later books include: *Those Fitzenbergers* (1917); *Gertie Swartz: Fanatic or Christian?* (1918); *Maggie of Virginsburg* (1918); *The Schoolmaster of Hessianville* (1920); and *The Marriage of Susan* (1921).

**MARTINELLI, GIOVANNI** (1885- ). An Italian operatic tenor, born at Montagnana. He began his musical career as a clarinet player in an Italian regiment and later studied singing with Mandolini. He made his debut in Verdi's *Ernani* in Milan (1910). In 1912 he sang at Covent Garden, and in 1913 he became one of the leading tenors at the Metropolitan Opera House, where, after the death of Caruso, he succeeded to many of the latter's rôles. He was also heard in Rome and Buenos Aires.

**MARTINIQUE.** An island colony of France, located in the Lesser Antilles in the West Indies. Its area is 385 square miles; population in 1923, 244,439. The chief commercial town was Fort-de-France, with a population of 26,399. The population was almost wholly Creole except for the considerable number of British Indian, Chinese, and African laborers. Sugar, rum, and cocoa remained the chief products. The sugar export, which reached 40,000 tons before the War, dropped to 16,460 tons in 1920. The 1921 figures show an increase to 24,213 tons. Rum exports in 1921 totaled 14,950,800 litres. Exports for 1913, 1920, and 1921 were 28,896,814 francs, 128,953,479, and 89,110,544. Imports for the same years were 22,144,315 francs, 132,186,517, and 84,508,370. France took nine-tenths of the exports and sent one-third of the total imports in 1920. That the increase in the trade was real, in spite of the depression of the franc, may be seen by the fact that the rum exports increased from 18,821,900 litres in 1913 to 33,109,100 litres in 1919, and 22,449,300 litres in 1920. Similarly, in 1911, 88 vessels of 156,000 tons entered Martinique ports, while in 1919, 766 vessels of 341,206 tons entered. The budget of 1924 carried 22,100,000 francs for expenses, and for receipts, 21,400,000. The deficiency was to be covered by an advance of 700,000 francs from the reserve fund.

**MARX, WILLIAM** (1863- ). A German statesman, born in Cologne. He studied law and became well-known as a jurist. He was long active in the Clerical Party and served in the Prussian Diet. He was for 12 years a member of the Reichstag, and on Nov. 2, 1922, was appointed chancellor, succeeding Gustav Stresemann. He carried on the difficult affairs of the government in 1922, 1923, and 1924 and attended several of the most important conferences on reparations and other questions, including the conference on the Dawes Plan in London in August, 1924. Largely through his efforts, an agreement was finally obtained on the Dawes Plan. See GERMANY, *History*.

**MARYLAND.** Maryland is the forty-first State in size (12,327 square miles), and the twenty-eighth in population; capital, Annapolis. The population increased from 1,295,346 in 1910 to 1,449,661 in 1920, a gain of 11.9 per cent. The white population rose from 1,062,639 to 1,204,737; negro, from 232,250 to 244,479; native white, from 958,465 to 1,102,560. The foreign-born white population fell from 104,174

to 102,177. The urban population was 658,192 in 1910, 869,422 in 1920; while the rural population decreased in the decade from 637,154 to 580,239. The growth of the principal cities was as follows: Baltimore (q.v.), 1910, 558,485; 1920, 733,826; Cumberland, 21,839 to 29,837; Hagerstown, 16,507 to 28,064.

**Agriculture.** While the population of the State increased 11.9 per cent in the decade 1910-20, there was a decline in rural population from 50 per cent of the total in 1900 to 40 per cent in 1920. The number of farms decreased 2.1 per cent from 48,923 in 1910 to 47,908 in 1920; and the area in farms decreased 5.9 per cent, from 5,057,140 acres to 4,757,999; and the improved land in farms, from 3,354,767 acres to 3,136,728. The total value of farm property showed an apparent increase, from \$286,167,028 in 1910 to \$463,638,120 in 1920; the average value per farm, from \$5849 to \$9678. In interpreting these values, and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 79.5 per cent in 1910 to 74.8 per cent in 1920. Of the total of 47,908 farms in 1920, 32,805 were operated by their owners, 1262 by managers, and 13,841 by tenants. The comparative figures for 1910 were 33,519, 988, and 14,416. White farmers in 1920 numbered 41,699, compared with 42,551 in 1910; colored, 6209, compared with 6372. The farms free from mortgage in 1920 were 19,292, compared with 21,084 in 1910; those under mortgage numbered 11,339 and 12,127 in those years. The number of dairy cows in 1920 was 188,537, compared with 166,859 in 1910; "beef cows," 13,704, compared with 18,816; mules, 32,621, compared with 22,367; swine, 306,452, compared with 301,583; sheep, 103,027, compared with 126,251. The estimated production of the chief farm crops in 1923 was as follows: corn, 23,580,000 bushels; wheat, 10,426,000; oats, 1,550,000; barley, 121,000; potatoes, 3,897,000; sweet potatoes, 1,056,000; tobacco, 27,489,000 pounds; hay, 362,000 tons; apples, 2,046,000 bushels; peaches, 631,000; and pears, 335,000. Comparative figures for 1913 are: corn, 22,110,000 bushels; wheat, 8,113,000; oats, 1,260,000; barley, 145,000; potatoes, 3,741,000; hay, 491,000 tons; and tobacco, 18,500,000 pounds.

**Manufactures.** Maryland is an important manufacturing State. There were in the State in 1909 4837 manufacturing establishments; in 1914, 4797; and in 1919, 4937. Persons engaged in manufacture numbered 125,489, 131,391, and 165,875; and capital invested amounted to \$251,226,828, \$293,210,925, and \$619,606,983, in those years. The products in 1909 were valued at \$315,669,150; in 1914, \$377,749,078, and in 1919, \$873,944,774. The large increase in the value of the products between 1914 and 1919 was largely due to the change in industrial conditions brought about by the War and cannot properly be used to measure the growth of production during the census period 1914-19; but the increase in number of establishments and in number of wage earners clearly indicates a decided increase in the value of manufactures. The manufacture of men's clothing ranks first in value of product: in 1909,

\$36,921,000; in 1914, \$39,048,000, and in 1919, \$72,589,000. Shipbuilding ranks second, with \$3,535,000 in 1909; \$4,521,000 in 1914; and \$67,310,000 in 1919; the extraordinary growth in the value of this product is due chiefly to the increase in shipbuilding during the War. Slaughtering and meat packing, in third place, had products valued in 1909 at \$13,683,000; in 1914, \$17,100,000; and in 1919, \$43,228,000. Fertilizers to the value of \$9,673,000 were manufactured in 1909; \$13,987,000 in 1914; and \$37,014,000 in 1919. The chief manufacturing city of the State is Baltimore, having in 1909 2502 manufacturing establishments, with a product valued at \$186,978,000; in 1914, 2502 with \$215,172,000; and in 1919, 2797 with \$677,878,000. In Hagerstown there were 76 establishments, with a product valued at \$3,197,000; in 1914, 113 with \$7,412,000; and in 1919, 122 with \$17,663,000. Other important manufacturing cities are Cumberland and Frederick.

**Education.** The educational problems of Maryland include a large rural population and a large colored population. Marked improvement was made both in administration and development of the school system during the decade 1914-24. In 1916 the school system was reorganized, and the issuing of teachers' certifications was made a State function. An equalization fund was established enabling every county to pay the State minimum salaries on a reasonable local tax rate for schools but without forbidding the county to pay more than the minimum if it so desires, by levying the tax rate above .67. This fund made it possible to secure a total salary increase for well-trained teachers of almost \$500,000, ranging from \$150 to \$700 per teacher. An extensive and intensive school campaign was carried on in 1921-22, as a result of which the people of Maryland became fairly familiar with the needs of the schools and the manner in which these needs might be met. The chief efforts were being directed to the organization, administration, and supervision of schools; to securing larger attendance at the State normal schools; establishing extension courses for teachers during the school year at State expense; promoting attendance at summer schools; and carrying out the provisions of the law passed in 1922 for more efficient supervision of both town and rural schools. Vocational education was carried on after 1917, and in 1921-22, 2240 pupils were enrolled in vocational courses, which was equivalent to one-sixth of the entire enrollment of the State outside of the city of Baltimore. All types of instruction which had developed in the national programme, except industrial rehabilitation, were in operation in Maryland. The total enrollment in the white elementary schools in 1921-22 was 188,296; in the white high schools, 20,127; a total white enrollment of 208,425. In the elementary schools for colored pupils were enrolled 46,573; in the high schools, 1392; a total colored enrollment of 47,965. The total enrollment in all schools, both white and colored, was 256,390, as compared with 237,125 in 1913. The percentage of illiteracy in the State was 8.7 in 1910 and 6.8 in 1920. Among the native white population it decreased from 3.7 to 2.5; among the foreign-born, from 12.3 to 14.3; and among the negro, from 28.6 per cent to 22.2.

**Finance.** For finance see STATE FINANCES.

**Political and Other Events.** Maryland is

usually reckoned Democratic, but in the decade 1914-24 there were marked fluctuations of power between Democrats and Republicans. In 1914, John Walter Smith, Democrat, was reelected to the United States Senate, defeating Edward C. Carrington, Jr., Republican; the Democrats elected five members of the House of Representatives, and the Republicans one. In September of that year, the hundredth anniversary of the defeat of the British at North Point in Baltimore and of Francis Scott Key's writing of "The Star-Spangled Banner" during the British bombardment, was celebrated. In May, 1915, municipal elections in Baltimore, having approximately half the State's population, were won by the Democrats; James H. Preston was reelected mayor over Charles H. Heintzeman. In November, 1915, Emerson C. Harrington, Democrat, was elected governor over Ovington E. Weller, Republican. The Democrats won control of the Legislature. In the same election, amendments to the State constitution were adopted, permitting increased home rule for Baltimore and the counties, and instituting the referendum except on sumptuary legislation. President Wilson carried the State the next year over Charles E. Hughes, Republican candidate for President. Dr. Joseph I. France, Republican, defeated David J. Lewis, Democrat, for United States Senator, and the seats in the House were divided between four Democrats and two Republicans. An amendment to the State constitution was adopted, effecting a drastic budget system for the State government. Special referendums were held on prohibition in local areas. Baltimore voted heavily against prohibition; most of the smaller areas voting also rejected prohibition. In 1917, the Republicans won the House of Delegates, and the Democrats the State Senate. The Legislature was Republican on joint ballot, for the first time in 20 years. In 1918, the Congressional delegation was divided equally, with three Democrats and three Republicans. A new charter was voted by the people of Baltimore, under the home rule amendment adopted in 1915. In May, 1919, the Republicans won a decided victory in the municipal elections of Baltimore, William F. Broening, Republican, defeating George Weems Williams, Democrat, for Mayor. In the November election, Albert C. Ritchie, Democrat, was elected governor over Harry W. Nice, Republican, by less than 200 plurality. The Legislature was Democratic. In November, 1920, Warren G. Harding, Republican, swept the State for president, against James M. Cox, Democrat; Ovington E. Weller, Republican, defeated John Walter Smith, Democrat, for United States Senator; the Republicans won four members of the House, and the Democrats two. In 1921, the Democrats elected the majority of the Legislature. In 1922, William Cabell Bruce, Democrat, was elected United States Senator over Dr. Joseph I. France, Republican; the six members of the House were divided equally between Democrats and Republicans; and the people adopted constitutional amendments increasing Baltimore's representation in the Legislature and reducing the number of State elections. In May, 1923, Howard W. Jackson, Democrat, was elected mayor of Baltimore over William F. Broening, Republican, and James H. Preston, candidate of the Citizens' party. In November, 1923, Albert C. Ritchie, Democrat, was reelected governor by a

large majority over Alexander Armstrong, Republican. The Democrats won the Legislature.

**Legislation.** Maryland's Legislature met in even years until and including the 1924 session. No regular session occurs between 1924 and 1927. Beginning with 1927, sessions are to be held in the odd years. In 1914, the Legislature enacted much legislation demanded by public opinion, including a new tax law, and established a new tax commission; it also passed a law for a survey of the public schools in the counties, a workmen's compensation law, and a new oyster-planting law. It also submitted to the people the home rule and referendum amendments to the constitution. In 1916, the Legislature submitted to the people the budget amendment, providing for a budget to be prepared by the Governor, items in which could be decreased or eliminated by the Legislature, although that body could not increase or insert items. A modern school law was enacted, based on the report of the survey previously provided, and the State departments were partially reorganized. In May and June, 1917, a special war session appropriated an emergency fund, created a State Council of Defense, and passed laws to compel work and for other war purposes. In 1918, the Legislature enacted the annexation law, largely expanding the corporate limits of Baltimore, and ratified the eighteenth amendment to the Federal Constitution. In 1920, the Legislature instituted the merit system in the civil service of the State. In 1922, it enacted a measure reorganizing the State government into departments, and submitted a \$9,000,000 soldiers' bonus to the people; the latter was invalidated by the courts. This session also submitted to the people the constitutional amendment increasing Baltimore's representation in the Legislature and an amendment providing one State election every four years instead of every two. Under the terms of the latter, State elections would be held in every other even year, beginning with 1926, and State officials, including legislators, would be elected for four-year terms. The 1924 session was devoted to routine legislation. In 1920, 1922, and 1924 the Legislature refused to pass bills for State enforcement of the eighteenth amendment.

**MARYLAND, UNIVERSITY OF.** A State institution at College Park and Baltimore, Md., founded in 1807. The student enrollment increased from 1200 in 1914 to 3735 in 1923, the number of faculty members from 211 to 253, and the library from 25,000 to 34,425 volumes. The annual income increased from \$250,000 in 1914 to \$1,889,760 in 1923. Part of an extensive building programme was completed in 1923. It included a stadium, a gymnasium and armory, and a dairy manufacture laboratory, at a total cost of \$262,800, and a research laboratory for animal pathology at a cost of \$10,000, all at College Park. At Baltimore a new building was purchased and equipped at a cost of \$40,000 for the Schools of Dentistry and Pharmacy; a new X-ray laboratory was equipped in the university hospital at a cost of \$10,000, and a nurses' home was built; and the Baltimore College of Dentistry, the first dental college established in the world, consolidated with the School of Dentistry of the University of Maryland. The extension courses in commerce were reorganized as the College of Commerce and Business Administration. The university changed

from the trimester to the semester system. President, Albert F. Woods, A.M., D.Agr., LL.D. **MASARYK, THOMAS GARRIGUE** (1850- ). President of Czecho-Slovakia, born in Hodonin, Bavaria. He was educated in the Universities of Vienna and Leipzig. He taught for several years and for a time was professor at the New Bohemian University of Prague. He was head of the Czecho-Slovak realistic movement in philosophy, literature, and politics and founded several reviews. In 1891 he entered Parliament and resigned in 1893. He was elected a deputy in 1907. He resisted strongly the encroachments of Germany on Austria and the aggressive policy of Austria in the Balkans. At the outbreak of the War he retired to Italy and Switzerland. He later became a lecturer in King's College, London. He organized the Czecho-Slovak movement of independence and visited the United States in its behalf. On the establishment of the republic he was elected president and by a provision of the constitution is qualified to hold that office during his entire life. He is the author of several books, including *The Problems of Small Nations in the European Crisis* (1915). See CZECHO-SLOVAKIA.

**MASEFIELD, JOHN** (1875- ). An English poet and dramatist (see Vol. XV). He continued to produce works in both prose and poetry during the decade. His later books include: *The Faithful* (1915); *Gallipoli* (1916); *The Old Front Line* (1918); *Enslaved, and Other Poems* (1919). He participated in the campaign in Gallipoli, and his description of operations there forms one of the most vivid pages in the written history of the War.

**MASON, EDITH** (1892- ). An American dramatic soprano, born at St. Louis, Mo. After studying with several teachers in New York, Boston, Philadelphia, and Paris, she made her debut as Nedda in *Pagliacci* with the Boston Opera Company (Jan. 27, 1912). During the next three years she sang in Nice, Marseilles, and Paris. In 1915-17 she was a member of the Metropolitan Opera Company. Then followed engagements in Havana, Caracas, and Mexico City, until 1919. In 1919-20 she appeared in Monte Carlo and again in Paris, and in 1921 she became one of the leading singers of the Chicago Opera Association. In 1919 she married Giorgio Polacco.

**MASON, MAX** (1877- ). An American mathematician, born at Madison, Wis., and educated at the University of Wisconsin and at Göttingen. In 1903 he became instructor of mathematics at the Massachusetts Institute of Technology and was appointed assistant in that subject at the Sheffield Scientific School of Yale, where he remained until 1908, when he accepted a call to Wisconsin. He became professor of mathematical physics there in 1911. He also lectured on his specialty at Harvard (1911). He made important studies on the calculus of variations, and the electromagnetic theory in pure mathematics. In the applied branches he contributed researches on submarine detection devices and acoustical compensators. During the War he was a member of the research staff at the United States Navy Experiment Station at New London and a member of the division of physical sciences of the National Research Council. He is the author of *The New Haven Mathematical Colloquium* (1910).

**MASSACHUSETTS.** Massachusetts is the

44th State in size (8266 square miles), and the sixth in population; capital, Boston. The population increased from 3,366,416 in 1910 to 3,852,356 in 1920, a gain of 14.4 per cent. The white population rose from 3,324,926 to 3,803,524; negro, from 38,055 to 45,466; native-born white, from 2,273,876 to 2,725,990; foreign-born white, from 1,051,050 to 1,077,534. The urban population mounted during the decade from 3,125,367 to 3,650,248; the rural population, on the other hand, decreased from 241,049 to 202,108. The growth of the principal cities was as follows: Boston (q.v.), 670,585 in 1910 and 748,060 in 1920; Worcester (q.v.), 145,986 to 179,754; Springfield (q.v.), 88,926 to 129,614; New Bedford (q.v.), 96,652 to 121,217; and Fall River (q.v.), 119,295 to 120,485.

**Agriculture.** While the population of the State increased 14.4 per cent in the decade, the percentage of the total population in rural territory, already small, decreased from 7.2 in 1910 to 5.2 in 1920. The number of farms decreased 13.3 per cent, from 36,917 to 32,001; the land in farms decreased 13.3 per cent, from 2,875,941 acres to 2,494,477; and the improved land in farms, from 1,164,501 acres to 908,834. The total value of farm property showed an apparent increase from \$226,474,025 in 1910 to \$300,471,743 in 1920; the average value per farm, from \$6135 to \$9389. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1910 was 55.9 per cent, compared with 48.5 per cent in 1920. The percentage of improved land decreased from 40.5 to 36.4. Of the total of 32,001 farms in 1920, 28,087 were operated by owners, 1627 by managers, and 2287 by tenants. The comparative figures for 1910 were 32,075, 1863, and 2979. White farmers in 1920 numbered 32,880, compared with 36,793 in 1910. In 1920, 22,950 of these were natives, as compared with 28,431 in 1910. Foreign-born farmers, for the most part from Canada, numbered 8930 in 1920 and 8362 in 1910. Negro farmers numbered 103, both in 1910 and in 1920. There were, in 1920, 18 Indian farmers, compared with 21 in 1910. Farms free from mortgage in 1920 numbered 14,055, compared with 18,768 in 1910; those under mortgage, 12,632 compared with 13,014. The number of dairy cows in 1920 was 173,844, compared with 171,936 in 1910; "beef cows," 5850, compared with 20,100; sheep, 18,880, compared with 22,699. The development in agriculture was in the direction of market gardening and special crops such as tobacco and onions. The area in tobacco increased 65 per cent in the decade. The estimated production of the chief farm crops in 1923 was as follows: corn, 2,778,000 bushels; oats, 340,000; potatoes, 3,122,000; hay, 559,000 tons; and tobacco, 13,700,000 pounds. Comparative figures for 1913 are: corn, 1,944,000 bushels; oats, 315,000; potatoes, 2,835,000; hay, 575,000 tons; and tobacco, 9,455,000 pounds.

**Manufactures.** Massachusetts is one of the most important of the industrial States. There were, in 1920, 66 cities having more than 10,000 inhabitants, whose combined population in that year formed 81.6 per cent of the total for

the State and in 1919 reported 86.3 per cent of the value of the State's manufactured products. There were in the State, in 1909, 11,684 manufacturing establishments; in 1914, 12,013; and in 1919, 11,906. Persons engaged in manufacture numbered 644,399, 676,642, and 812,521; and capital invested amounted to \$1,279,686,558, \$1,548,960,733, and \$2,947,108,527, in those years. The value of the products in 1909 was \$1,490,529,386; in 1914, \$1,641,373,047; and in 1919, \$4,011,181,532. The increase in value of the products between 1914 and 1919 was in great measure due to changes in industrial conditions brought about by the War. The increase in number of persons engaged in manufacture, on the other hand, clearly indicates a considerable growth in the manufactures of the State. The most important industry in point of value of products is the manufacture of cotton goods, valued in 1909 at \$186,462,000; in 1914, \$197,322,000; and in 1919, \$604,938,000. The manufacture of boots and shoes ranks second, with \$236,343,000 in 1909; \$255,188,000 in 1914; and \$573,037,000 in 1919. Woolen, worsteds, and felt goods, in third place, were valued at \$141,967,000 in 1909; \$130,349,000 in 1914; and \$352,913,000 in 1919. The manufacture of leather ranked fourth, amounting in value, in 1909, to \$40,002,000; in 1914, \$45,265,000; and in 1919, \$129,595,000. The most important manufacturing cities, in point of value of products, are Boston, Worcester, Fall River, Lawrence, and New Bedford. There were in Boston, in 1909, 3195 establishments, with a product valued at \$244,793,000; in 1914, 3138 with \$284,802,000; in 1919, 3077 with \$618,922,000. In Worcester, in 1909, there were 580 with \$77,148,000; in 1914, 606 with \$82,829,000; and in 1919, 618 with \$208,706,000. Fall River had 288 manufacturing establishments, with a product valued at \$64,146,000 in 1909; in 1914, 315 with \$64,663,000; in 1919, 293 with \$163,246,000. Similar figures for New Bedford were: in 1909, 207 with \$53,238,000; in 1914, 233 with \$65,575,000; and in 1919, 267 with \$210,773,000. Other important manufacturing cities are Lowell, Lynn, Somerville, Brockton, Springfield, Cambridge, and Haverhill.

**Education.** Massachusetts, from its earliest history, has devoted its utmost efforts to improvement of the educational facilities and conditions of its inhabitants. Progress continued in the State in the decade 1914-24. The Legislature during that time passed many important measures affecting education; among the most notable was an act, in 1919, establishing and maintaining continuation schools and courses of instruction for employed minors. Another act of 1919 raised the minimum educational requirements for leaving school to seek employment from the completion of the fourth to the completion of the sixth grade; a third established special classes for mentally retarded children. In 1921 the provisions of Congress for promotion of vocational rehabilitation were accepted by the State; a measure was passed providing for physical education for pupils in the elementary and secondary schools; a minimum salary of \$750 was established for all full-time teachers in the public day schools; and three measures to promote civic education in the public schools were enacted, requiring courses in duties of citizenship, United States history and civics, and the Constitution of the

United States. The growth of the school system is indicated by the fact that in 1914 the total school enrollment was 576,510; in 1923, 685,645. The percentage of illiteracy in the State decreased from 6.2 in 1910 to 5.9 in 1920; among the native white, from 0.4 to 0.3; among the negro, from 9.7 to 8.2. Among the foreign-born white population illiteracy increased from 13.1 to 13.5.

**Finance.** For finance, see STATE FINANCES. Also see MUNICIPAL GOVERNMENT.

**Political and Other Events.** There was much of importance in the political history of Massachusetts in 1914-24. In the latter part of that period, the State was honored by the accession of its former governor, Calvin Coolidge, to the presidency. Elections for State officers are held annually. In 1914 Governor Walsh, Democratic candidate, was elected, while the Republicans were successful in winning the minor State offices. The Cape Cod Canal was formally opened on July 29, 1914. On June 25 of this year a fire destroyed a large part of the city of Salem, causing a loss of about \$12,000,000. In 1915 Samuel W. McCall, Republican, was elected governor, defeating Governor Walsh, and Calvin Coolidge was elected lieutenant-governor. A woman suffrage amendment submitted to the people was defeated by a large majority. In 1916 Governor McCall and Senator Henry Cabot Lodge were reelected. In the presidential voting, Charles E. Hughes won 278,765 votes, compared with 247,845 votes for President Wilson. Governor McCall was elected for a third term in 1917. In 1918, however, the Democrats developed sufficient strength to elect former Governor Walsh to the United States Senate, defeating Senator Weeks, Republican, who was a candidate for reelection. Calvin Coolidge was elected governor, defeating Richard H. Long, Democrat. Governor Coolidge was reelected in 1919 and again in 1920. A strike of the Boston police, in September, 1919, drew nation-wide attention. A movement had been carried on for some time for the unionization of the police force. This was opposed by Commissioner of Police Edwin U. Curtis, who denied the right of the police to join a labor union. He was strongly upheld in this stand by Governor Coolidge. The police abandoned their posts and a night of rioting ensued. The militia was called out pending the recruiting of a new force. No striking officer was reinstated. Major Henry L. Higginson, founder and sustainer of the Boston Symphony Orchestra for 37 years, died on Nov. 14, 1919. He provided for the continuance of the orchestra under a board of trustees. In the presidential election of 1920, Warren G. Harding received 681,153 votes and James M. Cox 276,691, and Governor Coolidge became vice president. The Republicans in 1921 elected Channing H. Cox governor. Henry Cabot Lodge was reelected to the Senate, but by a greatly reduced majority. Two women, elected to the State Legislature, were the first so honored. During the summer of 1921 a pageant celebration was held at Plymouth commemorating the Pilgrim Tercentenary. On Apr. 13, 1922, the Supreme Court held that women were eligible for any State office. This year saw a cleansing of questionable legal practices. Two district attorneys were ousted and later disbarred, along with several other practicing attorneys. Governor Cox was reelected in 1923. The historic Washington elm,

in Cambridge, was cut down on Oct. 27, 1923. It had been dying for many years.

**Legislation.** The Legislature in Massachusetts meets annually. The most important acts in the decade 1914-24 are noted below. In 1914 the Legislature submitted a constitutional amendment giving the suffrage to women. It was necessary to pass this also in the Legislature of 1915. The amendment, as noted above, was defeated by a large majority. In 1916 the Legislature amended the laws relating to judicial procedure and also passed a defense act and amended the workmen's compensation law. The Federal prohibition amendment was adopted by the Legislature of 1918. In 1919 the Legislature ratified the woman suffrage amendment, passed measures providing for absentee voting, passed a so-called red flag law, enacted a measure regulating the use of aircraft, and reorganized the executive and administrative functions of the State. In 1921 a daylight-saving law was passed, a State boxing commission was created, the appointment of policewomen in Boston was authorized, and the workmen's compensation law was amended. In 1921 the Legislature amended the laws relating to the employment of minors and to automobiles. It also amended the game laws and provided for systems of relief for neglected, dangerous, or uncontrollable feeble-minded persons. In 1922 the Legislature created a new State commission of administration and finance. It also revised the State banking laws and amended the election laws. A measure providing for more stringent enforcement of prohibition was defeated. In 1923 a measure was passed centralizing the personnel and financial side of the government under a commission of four, in which is a comptroller's bureau, a budget bureau, a purchasing bureau, and a bureau of personnel. A measure was also passed regulating the sale of coal and one to facilitate cooperative marketing of agricultural produce.

**MASSACHUSETTS AGRICULTURAL COLLEGE.** A State institution for agricultural training founded at Amherst, Mass., in 1867. The number of four-year students fell from 526 in 1914 to 431 in 1923-24, but the total enrollment, including those taking the short courses, rose from 936 to 950. The number of faculty members increased from 56 to 92, volumes in the library from 45,000 to 70,000, and the annual State appropriation from \$317,746 to \$876,950. Six new buildings were added. President, K. L. Butterfield (resigned in 1924).

**MASSACHUSETTS INSTITUTE OF TECHNOLOGY.** A nonsectarian institution for technical education at Cambridge, Mass., founded in 1861. In 1916 it was moved from its old quarters in Boston to a group of new buildings in Cambridge, facing the Charles River and having 800 rooms. The enrollment of students increased rapidly, with the exception of the war years, to approximately 3500 in each of the two years 1920-21 and 1921-22, and dropped again to 2950 in 1923-24. The faculty was increased during the same period from 268 to 375 and the library from 120,000 to 155,609 volumes. More than \$14,000,000 was added to the endowment, which was \$3,049,975 in 1914 and \$17,278,000 in 1923-24; of this, \$6,500,000 was given by George Eastman. The School of Naval Architecture was built from funds bequeathed to the Institute by C. H. Platt prior to the War. In 1917-18 army and

navy schools of aeronautics and a school for aeronautical engineers were maintained for the Federal government, and a school for deck officers was opened by the United States Shipping Board. Richard Cockburn Maclaurin, LL.D., was president until his death in 1920. He was succeeded by Ernest Fox Nichols, LL.D., who resigned in the following year because of ill health. President, Samuel Wesley Stratton, D.Eng., Sc.D., LL.D.

**MASSEY, WILLIAM FERGUSON** (1856- ). A New Zealand statesman, born in Limavachy, County Derry, Ireland. In 1870 he removed to New Zealand and was for several years engaged in farming. He was early identified with the political life of the country and held many important positions. From 1894 he was a member of Parliament. He was Prime Minister in 1912 and was later Minister of Finance, Railways, Land, Labor, Agriculture, Industries, and Commerce. In 1917-18 he represented New Zealand in the Imperial War Cabinet and in 1919 was a delegate to the peace conference in Paris. He was also a delegate to the Imperial conference in London in 1921. He wrote various pamphlets on miscellaneous subjects.

**MAST, SAMUEL OTTMAR** (1871- ). An American zoölogist born in Washteno County, Mich., and educated at Michigan and Harvard Universities. He was professor at Hope College (1899-1908); associate professor and professor at Goucher College (1908-11); and associate professor and professor at Johns Hopkins University (1911- ). Professor Mast published numerous articles in journals, mainly on animal reactions, as well as *Structure and Physiology of the Flowering Plants* (1907) and *Light and the Behavior of Organisms* (1911).

**MASTERS, EDGAR LEE** (1869- ). An American writer, born in Garnett, Kan. He was educated at Knox College in Illinois and for a time studied law. His first book of poems was published in 1898 and was followed by several others. He attracted wide attention only after the publication of *Spoon River Anthology* in 1915. This was one of the most sensational books of verse published in many years. He wrote *Songs and Satires* (1916); *The Great Valley* (1916); *Toward the Gulf* (1918); *Starved Rock* (1919); *Mitch Miller*, a novel (1920); *Open Sea* (1921); *The Nuptial Flight* (1923), and *New Spoon River Anthology* (1924). He was a member of the National Institute of Arts and Letters.

**MASURIAN LAKES.** See **WAR IN EUROPE, Eastern Front.**

**MATERNITY PROTECTION.** Statistics in 1924 showed that the death rate among mothers, in the United States birth registration area, from causes connected with maternity, was not only greater than in 1915 but was higher than in all but one foreign country for which figures were available; and infant mortality, although it had decreased, was still higher than that of six other countries. Investigations over a number of years having revealed that employment of the mother during pregnancy was associated with a markedly high stillbirth rate, a high rate of premature births, and a high mortality in early infancy from causes directly related to the health of the mother before birth, legislative safeguards for maternity among working women began to be adopted in 1911 when Massachusetts enacted a law prohibiting the employment of women within a period of two

weeks before or two weeks after childbirth. Connecticut, Delaware, Missouri, and Vermont afterward made similar provisions. (See **WOMEN IN INDUSTRY.**) In 1921, after three years of effort, the Sheppard-Towner Act for the promotion of the welfare and hygiene of maternity and infancy was enacted. This act appropriates annually to each State accepting the provisions of the act the sum of \$5000 outright, with an additional \$5000 if matched from the State's own funds; while a still further sum is apportioned on the basis of population, when matched by State appropriations. Before the end of 1921 Delaware, Minnesota, New Hampshire, New Mexico, and Oregon had passed legislative acceptances of the act and had made administrative provisions. At the end of 1922, 42 States had accepted, 11 by legislative action, 31 through their governors pending the next session of their legislatures. The system was in operation in the fiscal year 1924 in 40 States; i.e. all but Connecticut, Illinois, Kansas, Louisiana, Massachusetts, Maine, Rhode Island, and Vermont; and for Hawaii an appropriation had been authorized for the fiscal year ending June 30, 1925. Porto Rico and Alaska had requested that the benefit be extended to them. The constitutionality of the Sheppard-Towner Act was challenged in 1923 but the constitutionality of the act was upheld by the Supreme Court of the United States as being an optional measure which imposed no obligation. Great Britain adopted a maternity and child welfare act in 1918. In 1923 the ministry of health reported 1950 maternity and infant welfare centres and 128 maternity homes in England and 222 maternity and child welfare centres in Wales.

**MATHEMATICAL PHILOSOPHY.** See **PHILOSOPHY.**

**MATHER, FRANK JEWETT, JR.** (1868- ). An American art critic and professor (see **VOL. XV**). His more recent writings include: *Estimates in Art* (1916); *The Portraits of Dante* (1921); and *A History of Italian Painting* (1923). He became editor of *Art Studies* in 1923.

**MATHEWS, ARTHUR FRANK** (1860- ). An American painter and teacher, born in Wisconsin, and educated at the schools of San Francisco and Oakland, Cal. In Paris he was the pupil of Gustave Boulanger and studied art in Europe for five years. He also made a study of architecture. His work included the reorganization of the California School of Design, where he was art director from 1890 to 1906. He has exhibited in the leading art centres of Europe, including the Paris Exhibition and the Salon, and at leading galleries in the United States; his work appears in permanent collections at the Metropolitan Museum, where he has a "California Landscape," at the State Capitol at Sacramento, Cal., the Oakland Library at Oakland, Cal., and the Masonic Temple in San Francisco. He also executed four triptychs for the University of California Library. He is a contributor of articles on art to reviews and is managing editor of the *Philopolis Magazine*.

**MATHEWS, JOHN ALEXANDER** (1872- ). An American metallurgist, born at Washington, Pa., and educated at Washington and Jefferson College, Columbia University, and in London at the Royal School of Mines and as a Carnegie Research Scholar at the British Steel and Iron Institute. He was metallurgist with the Sanderson Brothers Steel Company (1902-08) and

thereafter was general manager and president of the Halcomb Steel Company until 1920, when he became president of the Crucible Steel Company of America. He is an accepted authority on the metallurgy of iron. He directed his attention to alloy steels, especially electric furnace steel processes. Dr. Mathews received the first award of the Andrew Carnegie Gold Medal for Research in 1902 and was a member of the United States Assay Commission in 1900, 1905, and 1911.

**MATTER, THEORIES OF.** See CHEMISTRY.

**MAUGHAN, RUSSELL L.** (?- ). An American aviator who wrote a new page in the annals of aviation on June 23, 1924, when in a Curtiss pursuit plane he successfully made a dawn-to-dusk flight from New York to San Francisco in 21 hours and 48 minutes. This flight was undertaken by the Air Service to show the public the speed at which pursuit squadrons could be rushed from coast to coast in a war emergency.

**MAURITIUS.** An island British crown colony situated in the Indian Ocean 500 miles east of Madagascar. The area of the whole colony, which includes several small islands, is 720 square miles; the population in 1921 was 385,074, of which Indians and Indo-Mauritians numbered 265,884 and Chinese 6820. The capital and chief port, Port Louis, had 50,308 inhabitants in 1921. Sugar raising continued to engage almost the whole population. The sugar export in 1912 amounted to 206,677 metric tons; in 1919, it reached 302,826 tons; in 1921-22 it was 182,234 tons; in 1922, 292,744 tons. Aloe fibre and copra were the other exports. Total exports for 1913 and 1922 were £2,241,084 and £6,825,658. Total imports for 1913 and 1922 were £2,466,800 and £5,158,658. Imports included, in order of their value for 1921, machinery, cotton goods, iron and steel manufactures, ammonium sulphate, etc. In 1922, 451 vessels of 908,997 tons entered and cleared. In 1910, the tonnage had been 986,000. During the War the entire sugar crop was purchased by the British government at the prevailing high prices with the result that prosperity in the island was unexampled. This continued after the War and through the world-wide depression of 1920-21. Revenues for 1913-14 and 1920-21 were £742,846 and £2,678,000; expenditures, £681,098 and £1,649,000. On June 30, 1921, the colonial debt was £1,273,000. The municipal debt of Port Louis, contracted for harbor improvements in 1920, was £103,000. Accounts are kept in rupees, and conversions have been made at the nominal exchange rate of Rs.15=£1. The colony continued peaceful under British rule. The agitation of the Creoles for the return of the island to France in 1919 was short-lived, the continued prosperity stilling all dissent.

**MAX, PRINCE OF BADEN** (1867- ). A German statesman, born in Baden Baden. After studying law, he entered the army but retired without having seen active service. He was president of the First Chamber of the Baden Diet from 1907 to 1918. On account of the fact that he was not identified particularly with any prominent party, he was chosen chancellor on Oct. 3, 1918. During the consideration of the armistice proposals made by the Allies on November 9, he issued a formal declaration of the abdication of the Kaiser, and on the following day resigned from office. See BADEN; GERMANY.

**MAXIM, HUDSON** (1853- ). An American mechanical engineer (see VOL. XV). In 1915 and during the War he was a member of the United States Navy Consulting Board. He published *Defenseless America* (1915) and *Dynamite Stories* (1916).

**MAYBECK, BERNARD RALPH** (1862- ). An American architect, born in New York City. He studied architecture in Paris and at the University of California. From 1892 to 1900 he was instructor in drawing, descriptive geometry, and architecture at the University of California. He was the originator and manager of the Phoebe A. Hearst competition for the architectural design for the University of California and from 1902 was dean of the Department of Architecture of that University. He designed buildings for the Panama-Pacific Exposition and other important buildings for several towns and cities. He was associated with the United States Shipping Board during the War and was a founder of the Council of Allied Arts.

**MAYNARD, THEODORE** (1890- ). An American lecturer and author, born at Madras, India, and educated in India, in England, and at the Mt. Hermon School in Massachusetts. From 1909 to 1911 he resided in the United States and studied for the Congregational ministry. In 1911 he removed to England and in 1913 was received into the Roman Catholic Church. From 1921 he was professor of English literature in the Dominican College at San Rafael, Cal. He wrote *Drums of Defeat* (1916); *Folly and Other Poems* (1918); *The Last Knight* (1921); and *The Divine Adventure* (1921). In 1916 he was the winner of the Malory prize offered in London for the best volume of poetry.

**MAYNC, HARRY** (1874- ). A German writer, born in Berlin, who studied at the universities of Berlin and Leipzig. He was made editor of the German classics published by the Bibliographisches Institut of Leipzig and lectured at the University of Marburg. He later became director of the Seminary of the University of Berne. He is the author of *Uhlands Jugendgedichte* (1899); *Eduard Möricke: Sein Leben und Dichten* (1901); *Die Altdeutschen Fragmente von König Tirol und Fridebrand* (1910); *Wilhelm Meisters Theatralische Sendung* (1910); *Dichtung und Kritik: eine Rechtfertigung der Literaturwissenschaft* (1912); *Liliencron* (1919); *Fontane* (1920); and *Immermann: Leben und Werke* (1921). He also edited the works of Uhland, Möricke, Goethe, Immermann, Gottfried Keller, and Fontane.

**MAYO, CHARLES HORACE** (1865- ). See MAYO, WILLIAM JAMES.

**MAYO, WILLIAM JAMES** (1861- ). (See VOL. XV.) The most momentous event in the history of the Mayo Clinic at Rochester, Minn., occurred in 1915, when W. J. and C. H. Mayo donated \$2,000,000 to establish the Mayo Foundation for Medical Education and Research in affiliation with the University of Minnesota. During the War in Europe W. J. Mayo was made chief surgical consultant to the Medical Corps, United States Army, with the rank of colonel. C. H. Mayo was made associate consultant in surgery at the same time.

**MAYRHOFFER, JOHANNES** (1877- ). A German writer, born at Hamburg, and educated in philosophy and aesthetics at the universities of Berlin and Münster. He was for four years private tutor in Copenhagen and later traveled

extensively in Europe. As a literary free lance in Hamburg, Berlin, and Regensburg, he began to write works of fiction and travel. He is the author of *Der Mutter Vermächtniss* (1903); *Gebrüder Plaswich* (1908); *In der Jasminlaube* (1909); *Der Kleine Abenteuerer* (1911); *Jesuiten* (1916); *Der Kaiser des Sonnengottes* (1917); *Dilettanten der Liebe* (1919); *Was die Alster Rauscht* (1910); *Nordische Wunderfahrt* (1913); *Der Zauber des Südens* (1913); *Durch Länder und Meere* (1915); *Spanien* (1915); and *Türkische Lenzestage* (1917). He also wrote essays which include *Das Ideal des Schulmeisters* and *Ibsen*.

**MEAD, ALBERT DAVIS** (1869- ). An American zoölogist, born at Swanton, Vt., and educated at Middlebury College and Brown, Clark, and Chicago Universities. He was instructor in comparative anatomy (1895-96), associate professor (1896-1900), and professor of comparative anatomy (1900- ) at Brown University. Professor Mead published articles on the natural history of marine invertebrates and on the artificial culture of marine food animals.

**MEAD, CHARLES LAREW** (1868- ). An American bishop, born at Vienna, N. J., and educated at New York University. In 1895 he was ordained to the Methodist Episcopal Ministry and from 1895 to 1920 served as pastor in churches in New Jersey, Maryland, New York, and Colorado. He was ordained bishop of the Methodist Episcopal Church in 1920. During the War he served with the Y. M. C. A. in France.

**MEASLES.** Beginning with 1916 studies were prosecuted in several countries which resulted in the possibility of immunizing children against measles. Natural insusceptibility to this disease is as good as nonexistent; and as it destroys 10,000 lives annually in the United States, much salvage of life may result from wholesale immunization. On account of the long incubation period it is possible to prevent the disease after the child has been exposed, and immunization should of course be practiced as soon after exposure as possible. The immunizing substance is ideally the whole blood or plasma of a person who has recently recovered from measles, but it has been learned that the blood of practically all adults still contains the original immunizing substance which prevents contracting the disease a second time. Hence, in an emergency any adult may furnish immunizing blood; usually the parents of the child are called on. About a pint of blood may be taken at a time, as it is possible to preserve it for six months, and in case of epidemics sufficient blood may be difficult to obtain. It is necessary, as in blood transfusion, to be sure that the blood donor is healthy. The individual immunizing injection is small in amount, about 2.5 cubic centimeters. This is called the immunizing unit. If great haste is expedient and no blood is available, it may be taken from a parent and injected directly into the muscles. Immunization will have three consequences. In a few cases it will fail, and the patient will have typical measles. In other cases the child will develop modified measles, a very mild form. Finally, and in the majority of cases, it will escape the disease altogether. To show what may be done under favorable circumstances, Zingher of the New York City Health Department secured 90 per cent complete immunity in

one large series of cases treated in this way. **MEASUREMENTS, PRECISION.** See PHYSICS.

**MEAT PRODUCTION.** See LIVE STOCK.

**MECCA.** See ARABIA.

**MECHANICAL MUSICAL INSTRUMENTS.** See MUSIC, *Mechanical Reproduction*.

**MECHANICS, CELESTIAL.** See ASTRONOMY.

**MEDICAL PROGRESS.** The theory and practice of medicine and surgery made great advances during the period 1914-24. The War afforded the widest opportunity for the practice of military surgery and for the prosecution of hygienic and sanitary measures under military conditions. In certain cases enforced sanitation was practiced among the civil population which came under military authority or where the people generally were governed more directly than usual in the stress of War circumstances. Naturally there was some relaxation of the efforts of research hospitals and the devotees of experimental medicine in their laboratories, but after the termination of hostilities these and other agencies attacked their various problems with redoubled vigor, besides investigating questions raised by the War itself. At no time in the history of the world was medical research better organized, with more coöperation among the institutions concerned, or with more good will of the general public. For discussions of the fields in which progress has been most notable and results most interesting, see ABORTION; ADRENALIN; ANÆMIA; ANGINA PECTORIS; ANTHRAX; BIOCHEMISTRY; BLOOD PRESSURE; BOTULISM; BUBONIC PLAGUE; CANCER; CHIROPRACTIC; DIABETES; DIET; DIPHTHERIA; EPILEPSY; GALL STONE DISEASE; GOITRE; HAY FEVER; HEART DISEASE; INFANTILE PARALYSIS; INFLUENZA; INSANITY; LEPROSY; MALARIA; MEASLES; NEPHRITIS; PELLAGRA; PNEUMONIA; RHEUMATISM; RICKETS; SCARLET FEVER; SCURVY; SECRETIONS, INTERNAL; SLEEPING SICKNESS; SMALLPOX; SURGERY, RECONSTRUCTIVE; SYPHILIS; TUBERCULOSIS; TYPHOID FEVER; TYPHUS FEVER; VITAMINE; WOUNDS; YELLOW FEVER.

**MEDINA.** See ARABIA.

**MEDITERRANEAN FRUIT FLY.** See ENTOMOLOGY, ECONOMIC.

**MEEKS, EVERETT VICTOR** (1879- ). An American architect and educator, born in Mt. Vernon, N. Y., and educated at Yale, at the School of Architecture of Columbia, and in Paris. For several years he was associated with Carrère and Hastings but after 1914 practiced alone. He was acting professor of architecture at Cornell from 1914 to 1916, and from 1916 he was on the faculty of the School of Fine Arts at Yale as head of the department of architecture. During the War he was assistant director of fine arts of the Army Overseas Educational Commission. He became a member of the Society of Beaux-Arts Architects, the Société des Architectes Diplômés par le Gouvernement Français, etc.

**MEGGERS, WILLIAM FREDERICK** (1888- ). An American physicist, born at Clintonville, Wis. He studied at Ripon College and at Wisconsin and Johns Hopkins Universities. He was instructor in physics at Ripon and at Wisconsin, after which he was connected with the Carnegie Institute of Technology (1912-14). In

1914 he was called to the Bureau of Standards, where he filled the place of physicist. Dr. Meggers made special researches on topics connected with spectroscopy, astrophysics, photography, and measurements of standard wave lengths. On all these subjects he has published articles in technical journals and in the publications of the Bureau.

**MEGRUE, ROY COOPER** (1883- ). An American playwright, born in New York City, and educated at Columbia University. He wrote a great many successful plays, including *Under Cover*, with W. Hackett (1913); *It Pays to Advertise* (1914); *Under Fire* (1915); *Potash and Perlmutter in Society*, with Montague Glass (1915); *Seven Chances* (1916); *Under Sentence*, with Irvin S. Cobb (1916); *Where Poppies Bloom* (1918); *Tea for Three* (1918); and *Honors are Even* (1920).

**MEIGHEN, ARTHUR** (1874- ). A Canadian public official, born at St. Mary's in western Ontario, and educated at Toronto University. For a short time he taught school. He then moved to Winnipeg, where in 1903, after studying law, he was admitted to the bar. In 1908 he was elected as a Conservative to the Dominion Parliament and soon gained a reputation as a debater. He was reelected in 1911 and two years later was appointed Solicitor General. In 1915 he became a member of the Privy Council, and on the reorganization of the Cabinet in 1917, with a coalition membership, he was made Minister of the Interior; this post he retained until his appointment as Premier, in 1920, succeeding Sir Robert Borden. He also held the office of Secretary for External Affairs. He remained in office until the defeat of his government in 1922. In 1918 he was a member of the Imperial War Cabinet.

**MEIKLEJOHN, ALEXANDER.** See UNIVERSITIES AND COLLEGES.

**MEILLET, ANTOINE** (1866- ). A French Orientalist (see VOL XV). He is the author of many valuable works, among the most recent of which are *Grammaire du Vieux Perse* (1915); *Caractères Généraux des Langues Germaniques* (1917); *Les Langues de l'Europe Nouvelle* (1918); *Aperçu de l'Histoire de la Langue Grecque* (1913-21); *Linguistique Historique et Linguistique Générale* (1921); *Grammaire de la Langue Polonaise*, with Mme. de Wilmann-Grabowska (1921), and *Introduction à l'Étude Comparative des Langues Indo-Européennes* (1922). See PHILOLOGY, MODERN.

**MEINECKE, FRIEDRICH** (1861- ). A German historian. He was born at Salzwedel, studied at the Universities of Berlin and Bonn, and worked on the Prussian archives (1887-91). He was lecturer at the University of Strassburg (1896-1901), then at Freiburg, and in 1914 at Berlin again. He is the author of *Von Stein zu Bismarck* (1908); *Das Zeitalter der Deutschen Erhebung, 1795-1815* (1913); *Redwitz und die Deutsche Revolution* (1913); *Die Deutsche Erhebung von 1914: Probleme des Weltkriegs* (1917); *Preussen und die Deutschen im Neunzehnten und Zwanzigsten Jahrhundert* (1918); *Weltbürgertum und Nationalstaat* (1919); and *Nach der Revolution* (1919).

**MEINHARDT, RODERICH** (1882- ). An Austrian writer. The son of Adam Müller-Guttenbrunn, the novelist, he was born at Vienna. He studied history and art at the university there and became literary adviser to several publishing houses. He is the author of *Nach der*

*Heimat Möcht' Ich wieder* (1920); *Die am Wege Blieben* (1920); *Untergang*, a play (1920); and *Wiener Totentanz* (1921).

**MEISTER, ALOYSIUS** (1866- ). A German historian, born at Frankfurt, and educated at the University of Strassburg and in Rome. He was appointed lecturer at the University of Bonn and in 1911 became professor at the University of Münster. He is the author of *Die Anfänge der Diplomatischen Geheimschrift* (1903); *Grundzüge der Historischen Methode* (1906); *Deutsche Verfassungsgeschichte des Mittelalters* (1907); *Friedrich der Grosse und das Preussische Westfalen* (1912); *Geschichte, Wissenschaft, und Unterricht* (1913); *Kabelkrieg* (1914); *Bismarcks Auswärtige Politik in 1871* (1915); *Die Deutsche Presse im Krieg und Später* (1916); *Richtlinien für das Studium der Geschichte* (1916); and *Der Neue Geschichtsunterricht* (1920).

**MELANESIA.** See ETHNOGRAPHY.

**MELARTIN, ERKKI GUSTAF** (1875- ). A Finnish composer, born at Kexholm. He studied with Wegelius at the Helsingfors Conservatory and later under R. Fuchs in Vienna. For some years he taught theory and composition at the Helsingfors Conservatory. From 1908 to 1911 he was conductor of the symphony orchestra in Viborg and then returned to Helsingfors as director of the Conservatory. He is one of the most important of Finnish composers. His principal works are an opera, *Aino* (Helsingfors, 1907); four symphonies; two symphonic poems, *Siikajoki* and *Traumgesicht*; a violin concerto; incidental music to *Prinsessan Törnrosa*; four string quartets; and choruses, piano numbers, and songs.

**MELDRUM, ANDREW MACKENZIE** (1876- ). An American educator, born at Kilwinning in Ayreshire, Scotland. He removed to the United States in 1894 and studied at the College of the Bible in Lexington, Ky. He also studied at Melbourne University. After being ordained as minister in the Church of Christ in 1902, he held pastorates in Oregon. From 1914 to 1916 he was field secretary and special lecturer of Spokane University, of which he became president in 1916. For many years he toured the world as an evangelist.

**MELLON, ANDREW WILLIAM** (1855- ). An American Secretary of the Treasury, born in Pittsburgh, Pa., and graduated at the University of Pittsburgh in 1873. He at once entered the banking firm of Thomas Mellon and Sons of Pittsburgh, in which he was soon a partner. Later this firm developed into the Mellon National Bank, of which he became president in 1902, and the Union Trust Company and the Union Savings Bank, of both of which he was made vice president. He was long associated with H. C. Frick in the development of the coal, coke, and iron industries of western Pennsylvania and was an officer or director of many financial and industrial corporations. Mr. Mellon founded the town of Donora, Pa., established a large steel plant there, and built the first independent oil pipe line through Pennsylvania. His philanthropies were numerous, and he had much to do with the founding of Mellon Institute in Pittsburgh. In 1921 he was appointed Secretary of the Treasury by President Harding. He won an unusually high reputation as an authority on finance. In connection with his office he held the chairmanships of the Federal Reserve Board, the Farm Loan

Board, the War Finance Corporation, and the World War Foreign Debt Commission.

**MELSTED**, HENNING FINNE VON (1875- ). A Swedish author (see VOL. XV). Among his works are *Osamja* (1915); *Folket i Fangenskap*, on Belgium in German captivity (1916); *Sveriges Fara* (1916); *Ensam*, a play (1917); *Gerda*, a novel (1918); *Mordbrännerskan*, a novel; and *Salomos Dom*, a play (1919).

**MELTZER**, SAMUEL JAMES (1851-1920). (See VOL. XV.) During the War in Europe, Dr. Meltzer was a major in the Medical Reserve Corps, and when the American Association for Thoracic Surgery was organized in 1918 he was elected president. Nearly up to the time of his death he was engaged in research along widely differing lines, notably in resuscitation by pharyngeal insufflation, injections of magnesium sulphate for anaesthesia, experimental pneumonia, etc., and published numerous reports, alone and with collaborators.

**MEMEL**. This little town, with a population of 41,500 in 1910, at the mouth of the Niemen River in the southeast corner of the Baltic, became, during 1919-24, an important bone of international contention. As a harbor, before the War, it was comparatively insignificant; most of the trade of the region went by way of either Danzig and Königsberg, or Riga and Libau. Lumber was floated down the river to be shipped to England and the Rhenish cities, as well as some flax, seed, cereals, and cattle, while British coal and Norwegian chemical fertilizers were imported. Port facilities were antiquated and terminal conveniences inadequate, for no railway connected Memel with its hinterland. It was only during the War that Germany built a line north to Polanga, to connect at Prekult with the Libau-Mitau railway. By Article 99 of the Treaty of Versailles, the city and a narrow strip of territory to the southwest, containing an area of 945 square miles and a population of 150,000, were cut off from Germany and taken under the control of the Supreme Council. To German protests the Allies replied that while the city was German, the surrounding territory was undoubtedly Lithuanian, and that possession of the port was necessary to assure Lithuanian economic independence. In view of the unsettled state of Lithuanian affairs, it was deemed advisable to send a French force to take possession of the city early in 1920 and to hold it in trust for Lithuania. Friction at once manifested itself. The French were accused of listening too readily to the pro-German officials, of suppressing the local Lithuanian press, of entertaining Polish sympathies, and then of continuing their stay unnecessarily after Lithuania had received *de jure* recognition (Dec. 20, 1922). The local Germans sought the creation of a Memel Free State, while the Poles were frankly obstructionist. The tardiness of the Allies in settling the problem goaded the Lithuanians, chafing already as a result of the loss of Vilna, to take matters into their own hands. On June 10, 1923, therefore, the so-called Committee for the Welfare of the Territory of Memel seized the city, interned the French soldiers, and after a local diet had confirmed the step, had the satisfaction of announcing that Memel had become a part of Lithuania and that the customs lines were abolished. Allied protests were unavailing; the Kovno (Lithuanian) government disclaimed all complicity or even knowledge of the affair. Allied

warships came and departed, and the French garrison left, after a stay of almost four years. The Council of Ambassadors, on Feb. 16, 1923, drew up a statement of principles by which the transfer of the district to Lithuania was to be accomplished; to this, in principle, too, the Lithuanians subscribed. The formulation of a specific convention was another matter. To September, 1923, negotiations dragged on between the Lithuanian government and the Council of Ambassadors and eventually ended in a deadlock because of the Lithuanian refusal to accept the machinery proposed in the draft convention for the regulation of international commerce, specifically Polish, by and through the port. The matter was here complicated by the Polish claims that Memel constituted the natural outlet for about 60,000 square miles of Polish territory, that Poland was part of Memel's economic hinterland, and that Poland's interests therefore needed safeguards. Lithuania then proposed the adjudication of the matter by the Permanent Court of International Justice; the Council of Ambassadors decided, however, to submit the controversy to the League Council. Thus requested, the League Council, late in 1923, invited Norman H. Davis, an American, and two others, to act as arbitrators. On Feb. 4, 1924, the commission set to work, and on Mar. 14, 1924, it reported to the League Council. On that day, as a result of the arbitrators' findings, three conventions were signed by Great Britain, France, Italy, Japan, and Lithuania, which, in effect, provided for the transfer of Memel to Lithuania; the establishment of the city and region as an autonomous unit with full legislative, judicial, and administrative rights; the guarantee to foreign nationals of the same rights accorded the people of Memel; the creation of a harbor board of three made up of a representative each of Lithuania, Memel, and the League of Nations; the free transit by sea, water, and rail of all hinterland traffic. In all the negotiations, a marked conciliatory spirit was displayed by the Lithuanians, and, in the opinion of Mr. Davis, they had made the fullest concessions possible. Poland, however, remained disgruntled. See LITHUANIA; POLAND.

**MEMPHIS**. The commercial metropolis of Tennessee. The area of the city was increased from 19.3 to 25.3 square miles; the population rose from 132,778 in 1910 to 162,351 in 1920, to 170,067 by estimate of the Bureau of the Census (1923), and by city estimate to 211,058 in 1924. The city created a planning commission which prepared a major and minor street plan and zoning system. A considerable amount of building was carried on, including a municipal auditorium seating between 12,000 and 14,000 persons, new waterworks, three large hotels, several office buildings, industrial plants, apartments, a long viaduct across the Illinois Central Railroad tracks, a railroad bridge 4500 feet long across the Mississippi, extensive river-rail interchange terminals, and many new school buildings and additions, including the new Southwestern College. The Mississippi River Federal Barge Line was operated by the government, carrying over 12,000 tons of freight monthly in 1924, in addition to freight handled by many river packet steamers.

**MENCKEN**, H(ENRY) L(OUIS) (1880- ). An American author and editor, born at Baltimore, Md. He was graduated at the Baltimore Polytechnic and at once began his journalistic

career on the *Baltimore Morning Herald*. Later he came to New York and was connected with the *Evening Sun*. In 1914 he became an editor of *Smart Set*; in 1921, a contributing editor of *The Nation*. He edited the *Players' Edition of Ibsen's Plays* (1909) and *The Free Lance Books* (1919- ) and is the author of *Ventures into Verse* (1901), *George Bernard Shaw, His Plays* (1905); *The Philosophy of Friedrich Nietzsche* (1908); *The Artist* (1912); *A Book of Burlesques* (1916); *In Defense of Women* (1917); *The American Language* (1918); *Prejudices, First Series* (1919); *Second Series* (1920); *Third Series* (1922); and *On Democracy* (1922). In 1924 he undertook, with George Jean Nathan, the editorship of the new *American Mercury*.

**MENDELISM.** See BOTANY: HEREDITY.

**MENDENHALL, CHARLES ELWOOD** (1872- ). An American physicist, born at Columbus, Ohio, and educated at Rose Polytechnic Institute and Johns Hopkins University. He was an aid on the United States Coast Survey, and during 1894-95, an assistant in physics at the University of Pennsylvania, after which he was an instructor at Williams. In 1901 he accepted a call to Wisconsin, where in 1905 he became full professor. His researches included studies on the absolute value of gravity, high temperature measurements, luminous efficiencies, and constants of radiation, on which he wrote important papers for various technical publications. During the War he was major in the science and research division of the Signal Corps and Air Service (1917-19) and chairman of the division of physical sciences in the National Research Council (1919-20). He also served as scientific attaché to the United States Embassy in London (1919).

**MENDENDEZ, PIDAL RAMON** (1869- ). A Spanish philologist (see VOL. XV). He is the author of works on the history and literature of Spain. Among the most recent are *Antología de Prosistas Castellanos* (1917), *Cronicas Generales de España* (1918), *Estudios Literarios* (1920), and *Un Aspecto de la Elaboracion del Quijote* (1921).

**MENGELBERG, WILLEM** (1871- ). A Dutch orchestral conductor (see VOL. XV). In 1921 he made his second visit to the United States and conducted the newly established National Symphony Orchestra of New York for the second half of the season (Jan.-March). His sensational success brought about the amalgamation of the new orchestra with the Philharmonic Society and his permanent engagement as conductor for the second half of the Philharmonic season (Jan.-April). He retained at the same time his post as regular conductor of the Concertgebouw Orchestra in Amsterdam for the summer and fall; during his absence in New York this orchestra played under guest conductors.

**MENOHER, CHARLES THOMAS** (1862- ). An American army officer, born in Johnstown, Pa., and educated there and at the United States Military Academy. He went to France in 1917 in command of the 5th Field Artillery (Regular). He later commanded the school of instruction for field artillery at Saumur in France. He was in command of the 42d (Rainbow) Division and later the 6th Army Corps. He was appointed director of the Air Service on Jan. 2, 1919, and chief of the Air Service on July 1, 1920.

**MENSHEVIKS.** See RUSSIA, *History*.

**MENTAL MEASUREMENT.** The rise of

intelligence tests during the decade 1914-24 constituted one of the most remarkable chapters in the history of applied science. Significant alike for its bearing on psychological theory and its effect on educational practice, the development of mental measurement was attended both by bitter controversy and enthusiastic hopes. The very nature of the undertaking, the effort to chart the resources and capacities of the human mind, could scarcely permit the scientific and lay public to remain either indifferent or uninterested. Moreover, the peculiar organization of the American school system, its freedom from tradition and from the control of a central authority, and its consequent readiness for pedagogical experimentation, all combined to give impetus to the movement for mental testing. If we add to this the preoccupation of the American public with the human quality of the recent immigration and the extraordinary opportunity afforded by the army mobilization for classifying the intellectual fitness of the racial stocks in the United States, we shall then be in a position to appreciate the extraordinary interest that has been taken in the new scientific technic.

The pioneer construction of tests and scales of intelligence was the work of two Frenchmen, Binet and Simon, in the decade before 1911. Although their work was immediately introduced into the United States, it was not until the publication of the Stanford revision of the Binet tests in 1916 that the movement passed out of the laboratory stage. After that date intelligence testing, from a theoretical scheme, became definitely a technic, which like all technics was to be perfected in actual practice. To understand the aims and purposes of intelligence testing it is necessary first of all to bear in mind the chronic grievance against schools and scholastic education. If the ordinary school examinations tested the practical capacity of the intelligence as much as they test the accumulated stock of book knowledge, there would never have arisen any need for special intelligence tests. While obviously the capacity to absorb book information and the ability to adapt oneself to new situations are not unrelated, it is none the less true that the two capacities are to a large measure autonomous and independent of one another. The question naturally arises why educators have for thousands of years persisted in measuring the parrot-like capacity for information instead of concentrating on the all-important faculty of general intelligence. The answer is quite simple. They had the instrument for measuring the first capacity but not for measuring the second. A written examination is a positive, we might even say scientific, measure of the amount of knowledge which a student possesses at the time he takes the test. To measure general intellectual capacities requires, however, something more than ink and paper. It requires judgment on the part of the examiner, and this judgment, if it is not to be capricious, must have for its support something corresponding to a general table of past performances. This support or tool has been lacking all through the ages, and it was supplied only through the perfection of statistical methods in the latter part of the nineteenth century. In point of fact, when we talk of measuring capacities we are really using a figure of speech to express our prediction of future actions. This prediction, to be reliable, must be

based on a proper interpretation of statistical probabilities, a task not at all simple and requiring expertness of a high order. All the disputes over the use of intelligence tests have hinged on the significance to be attached to certain statistical facts, and unfortunately there is no open sesame to the true analysis. While we may use mathematics to perfect our judgment, mathematics cannot make us dispense with the need for judgment.

The very notion of scales furnishes an interesting sidelight on the nature of the problem involved. Intelligence cannot be measured like certain chemical properties by the application once for all of a specific test. It is a growth; in other words, its manifestations vary with the age of the individual. Hence the necessity of constructing scales of tests, each test representing what experience has shown to be the average aptitude for a given age. The Binet scale was standardized on the basis of 400 Parisian school children. The tests were graded from the ages of three to 16. The intelligence of a child of three, for instance, was estimated on his ability to show nose, eyes, and mouth, his fluency in repeating number digits, etc. For later ages the tests were increasingly abstract, and it is indeed the general opinion that the upper tests of the Binet scale measure more than anything else the ability for abstract thinking. A school child was said to have the intelligence of that age all of whose tests he succeeds in passing. The natural thing to do then was to compare the mental age with the chronological age, but instead of measuring the discrepancy between the two, Binet found it more advisable to calculate their ratio. This ratio is the famous Intelligence Quotient or I.Q. It was seen to remain more constant for a particular individual than the arithmetical difference between the two ages. Thus it meant nothing to say that a child was one year ahead or behind his class, for a year at 12 and a year at six did not have the same significance. The intelligence quotient, representing as it did his classification among his peers, seemed to go with the child through all his years.

In importing the Binet scale into the United States it was found necessary to make extensive revisions in order to overcome differences of language habit. The Stanford revision was standardized on the basis of some 2000 children and adults. It postulated with the Binet system that the intelligence age of the average adult is 16—but properly speaking all that this means is that the tests measure a certain kind of growth up to the age of 16. Beyond that age different factors enter into consideration. The re-tests of individual children carried out at Stanford University seemed to confirm the relative constancy of the I.Q., successive determinations never varying more than 10 per cent. The Stanford-Binet scale is the most widely used of those embodying the principle of the I.Q. Its disadvantage of requiring individual examination has stimulated the development of group tests, graded by point scores. Of this type the best-known is the Yerkes test, under which partial credits are given for partial performance and the individual point score compared with the average point score for a chronological age. The resulting ratio is known as the coefficient of mental ability and differs from the intelligence quotient in that certain inferences cannot be made from it. In addition to

these two general types of mental tests, there are several devised to measure particular abilities and character traits. While all of them have some diagnostic value when interpreted by competent persons, the usefulness of the tests when applied by routine examiners is questionable.

**United States Army Tests, 1917-19.** The great importance of the army tests lies in the large number of subjects examined. The printed report, published in 1921 as a memoir of the National Academy of Science, has the magnitude of a volume of census returns. Altogether, in the period between September, 1917, and January, 1919, 1,726,966 men, including 42,000 officers, were tested. The vast majority were examined by means of group tests, but individual tests to the number of 82,500 were also given. The two general tests used by the army were the Alpha, a group test for literates, and Beta, a group test for foreigners and illiterates. All the tests, individual or group, employed the method of point score and partial credit, and the scores were later converted into letter grades. For the purpose of this conversion the tests were speeded up so that only 5 per cent could obtain the A grade. This procedure, justifiable from the point of view of statistical convenience, proved a source of much popular misconception. The device did not in any way affect the relative standing of the different individuals, but it did affect decidedly the sociological use to which some of the test statistics were afterwards put. Popular writers pointed with alarm to the fact that less than 15 per cent of the army recruits were A and B men and that the majority were C-, D, and D-. When the letter grading was transmutated into the Binet-Stanford system of mental ages, the way was opened for a misinterpretation even more serious. The comparison of the Stanford and the army scales was made by means of 653 soldiers, who were tested by both methods. On this weak bridge the entire array of scores was transported, and when the battle was over, it was found that the average mental age in the army had dwindled to 13 years and 4 months. The assumption of the Binet-Stanford tests was of an adult mental age of 16, but it should be remembered that these mental ages, even granting that they are applicable to adults, were standardized on the basis of what 80 per cent of a given age were able to pass. This norm has been criticized as being altogether too high, and it is evidently one of the factors at any rate responsible for the depression of the army's mental age.

It is naturally impossible in the space of this article even to begin to analyze either the detailed statistical results of the army examinations or the equally vast amount of scholastic computations that have accumulated since the official tests. Nevertheless the leading questions may be profitably discussed without recourse to complicated mathematics. The most important of these is obviously the question of the intelligence itself. A critically minded psychologist has observed that we should avoid all confusion if we only defined intelligence as that which the intelligence tests test. Unfortunately this solution is too simple to meet the problem. The intelligence tests were constructed not without certain preconceptions as to the functioning of the intelligence in the popular sense of the term. Yet it is necessary to consider the

intelligence tests independently of the reality they were constructed to measure, and to regard the intelligence quotient as the technical I.Q. of the Binet-Stanford scale not to be interpreted outside of its context. When we wish to compare the I.Q. with the intelligence as each of us conceives it, we must make a separate judgment. The distance between the I.Q. and the popular conception of intelligence may become ever so much smaller, either through the perfection of the tests or through a change in the popular conception; but there will always remain the necessity for comparison. The fact is generally admitted that the Binet-Stanford tests emphasize a certain kind of ability at abstract thinking. Now it may be true that human civilization has progressed through the perfection of abstract thought, but so long as we do not all of us feel a moral obligation to become mathematicians, it is not necessary to take the I.Q. rating too seriously. The intelligence tests do detect feeble-mindedness, but even feeble-mindedness is in the last analysis a judgment of society. Those who are congenitally unable to live up to the requirements of social life are segregated into institutions. The intelligence tests are able to detect feeble-mindedness only because in some degree they are representative of the existing social order. But it is far from necessary to possess a high I.Q. in order to enjoy in our republic the right to life, liberty, and the pursuit of happiness.

When we turn to the problem whether intelligence is hereditary, we come up against a maze of difficulties. In the first place, we must of course distinguish between intelligence as tested by the tests and intelligence as we conceive it to exist; even then we must leave room for errors of conception. Practically the only guide we have to the problem is the general notion that all things biological represent a growth or an evolution. It is customary to decompose this evolution into two sets of factors, environment and germ plasm. But these two sets of factors are after all abstractions on which we dare not base too far-reaching conclusions. The only proper use we can make of this analysis is to regard biological growth for any short period of time as translatable in terms of a mechanism of action and reaction. But this mechanism is only a rule of thumb which cannot be applied over long stretches of time without leading to absurdities. In the case of intelligence, opposing schools have stressed either one or the other of the two sets of factors, either germ plasm or environment. Those who have upheld the germ plasm theory have made the environment a passive spectator of a predetermined evolution of the germ plasm; on the other hand, the environmentalists have made the germ plasm a helpless *tabula rasa*, on which the external world writes what it will. The complexity of the problem is further evident when we realize that it has been impossible to frame any general and consistent theory of heredity that will account for the transmission of the grosser physical characteristics. It is not that heredity is a pure matter of chance but rather that we observe very little of the process. Intelligence, if we define it in Aristotelian fashion as the cutting edge of the individual, is probably more subject to environmental influence than the general frame, which in the long run, as we know, also evolves. In one sense we are sharpening or

blunting the blade by every specific act that we perform, but in another sense the general sharpness or temper remains stable. It is therefore quite plausible to assume that the general brightness of an individual may become visible in the period of school age, without arguing either for the predetermining of this brightness by heredity or the predetermining of the individual's future life by this brightness. The first assumption, if allowed to prevail, would mean the end of democracy and the inauguration of government by the hereditary I.Q. The acceptance of the second assumption would mean the end of all competition for honors and places, the entire extinction of the social struggle for existence. Needless to say, both of these assumptions would be far-fetched even if the intelligence scales were 100 times as accurate as they pretend to be at present and 100 times as representative of the true capacities of the human individual.

In conclusion we may touch on the question of racial differences. It is well-nigh useless to refer the uninitiated reader to the statistics on the subject because of the startling contrast between the microscopic accuracy of the arithmetical calculations and the hasty generalizations on which the calculations are based. The army examiners, employing a nonverbal performance test for illiterates and foreign-born, found evidence of superiority on the part of the native white stock over the recent immigrants from southern and eastern Europe and more particularly over the negro stock. The figures are difficult to interpret in view of the fact that the northern negroes, whose difference from the southern negroes is social rather than racial, were able to make an enormously better showing. It seems questionable whether the influence of language and other environmental factors was sufficiently eliminated even in the Beta test. The claim has therefore been made that the tests favored the habits of mind of the native white stock at the expense of the other stocks. That there are racial differences seems probable from all the biological and anthropological evidence on the subject. But we have no really sure way of estimating the extent of these differences except by the biological test that there is no natural bar to the cross breeding of the most distant races. As regards the subraces, peoples, and nationalities, it is for heuristic reasons best to consider the social reality as the changing element and the hypothetical germ plasm as relatively one. To do anything else would make the writing of history impossible. Instead of studying French civilization and German *Kultur*, we should then have to concentrate on the metaphysical *Ding an sich* of Gallic and Teutonic germ plasm.

**Bibliography.** Books on intelligence testing are legion. Pinter's *Intelligence Testing, Methods and Results* (1923) may be recommended to the elementary student. Terman's *Measurement of Intelligence* (1916) and *The Intelligence of School Children* (1919) give the point of view of the leader of the Stanford school. Vol. XV of the *Memoirs of the National Academy of Sciences*, entitled "Psychological Examining in the United States Army" (1921), is an indispensable work of reference. A good controversial discussion of the subject, induced by Walter Lippmann's attack on the army tests, may be found in the 1922 and 1923 volumes of *The New Republic*, and more scientific discus-

sions in the psychological periodicals, particularly *The Journal of Educational Psychology*, vol. xii and vol. xiii.

**MENZIES, ALAN WILFRID CRANBROOK** (1877- ). An American chemist, born at Edinburgh, Scotland. He was graduated at Edinburgh University and later studied at Aberdeen, Leipzig, and the University of Chicago. He was assistant professor of chemistry at Henriot-Watt College in Edinburgh and professor of chemistry at Mungo's College at Glasgow. Meanwhile he also organized and directed (1904-08) summer courses for science teachers in Ireland. In 1908 he came to the United States and became connected with the chemical department of the University of Chicago (1908-12), and during 1912-14 he was professor and head of the department of chemistry at Oberlin. He resigned from Oberlin in 1914 to accept a call to the chair of chemistry at Princeton. He was also associate chemist with the Bureau of Standards in Washington (1918-19). His original researches were chiefly concerned with matters of physical chemistry, such as vapor pressure and vapor density, molecular weights, ebullioscopy, and hygrometry.

**MERCHANT MARINE.** See SHIPPING; SHIPBUILDING; etc.

**MERCERIZATION.** See TEXTILE MANUFACTURING.

**MERCIER, DESIRÉ JOSEPH, CARDINAL** (1851- ). A Belgian prelate of the Roman Catholic Church (see Vol. XV). During the War he was uncompromising in his opposition to the hardships imposed on the Belgian people by their German rulers and unceasing in his demands for the betterment of conditions. One of his pastoral letters, an eloquent exposition of the civic and national rights of Belgium, resulted in his arrest in January, 1915. Soon released, he remained throughout the German occupation a thorn in the side of the German officials and administration. He was one of the great figures of the War. In 1919 he published *War Memories*. He also wrote several books on philosophy, including *A Manual of Modern Scholastic Philosophy* (1917). In 1922 he visited the United States and was received with great honor.

**MERCURY.** See QUICKSILVER.

**MERCURY BOILER.** See BOILERS.

**MEREDITH, EDWIN THOMAS** (1876- ). An American agriculturalist and public official, born at Avoca, Iowa, and educated at the Highland Park College in Des Moines. For several years he edited agricultural papers in Des Moines. In 1902 he established *Successful Farming*. He was a director in many financial institutions and was also active in politics. In 1914 he was a candidate for United States senator and in 1916 for governor of the State of Iowa. He served on the Industrial Conference in 1919 and was a member of several other boards engaged in agricultural investigations. In 1920-21 he was Secretary of Agriculture in the cabinet of President Wilson.

**MERRIAM, JOHN CAMPBELL** (1869- ). An American palæontologist (see Vol. XV). In 1919 he was chairman of the National Research Council, and in 1920 he became president of the Carnegie Institution at Washington, D. C. He was a member of many scientific organizations.

**MERRILL, ELMER DREW** (1876- ). An American botanist, born at East Auburn, Me.,

and educated at the University of Maine and George Washington University. After serving on the faculty of the University of Maine and with the Department of Agriculture in Washington, he was appointed botanist by the Bureau of Agriculture at Manila, P. I., in 1902. From 1903 to 1905 he was in the service of the Bureau of Government Laboratories, and from 1906 he was connected with the Bureau of Science. In 1912 he was appointed associate professor of botany and head of the department at the University of the Philippines, where he became full professor in 1916. In 1919 he became director of the Bureau of Science in Manila; in 1923, dean of the California College of Agriculture. Professor Merrill carried on many investigations in the Philippines and elsewhere and described more than 2500 new specimens of plants. He was a member of many scientific societies and the author of *A Flora of Manila* (1912), *Enumeration of Bornean Plants* (1921), and many articles on the botany of North America, China, the Philippines and Malaya.

**MERRIMAN, MYRA HUNT KINGMAN** (MRS. JOSIAH C. MERRIMAN) (1873- ). An American editor and writer, born at Tremont, Ill. She studied journalism, civics, and philanthropy at the Illinois State Normal School and was for many years a member of the editorial staffs of several papers in Chicago. She also acted as traveling South and Central American correspondent for newspapers. In 1894 she became a member of the staff of several papers in California. During the War she was a member of the board of directors of the Bureau of Registration for Woman's Service and was a member of several other important committees. She was secretary of the National Council of Women of the United States in 1920-21 and was a delegate to the International Council of Women in 1921. In the same year she was chairman of the official delegation of 40 women which investigated conditions in Europe.

**MESOPOTAMIA, or IRAQ.** A British mandate territory, lying between the Tigris and Euphrates Rivers and made up of the former Turkish vilayets of Bagdad, Basra, and Mosul. Area, 143,250 square miles; population in 1920, 2,849,282. The population is largely Arab by race and Mohammedan by religion. Turks, Kurds, Jews (in the towns), Christians belonging to Roman Catholic and Syrian Catholic churches, and some Persians were also to be found. By religions the population was divided into 1,146,684 Sunnis and 1,494,015 Shi'ahs (both Mohammedan), 87,488 Jews, 78,792 Christians, and 42,302 others. Basra, at the head of the Persian Gulf, was the chief town; Bagdad was next in importance.

**Industry and Trade.** Agriculture was the leading activity of the population, and wheat, barley, and rice were grown in considerable quantities. Irrigation was indispensable even in the northern regions and was a constant concern of the government. In 1919 the ancient canal, Saqlawiyah near Fellyyah on the Euphrates, was reopened for the service of some 70,000 acres in winter and 36,000 acres in summer. The importance of the rôle played by irrigation may be gauged from these items in the 1919-20 budget: irrigation maintenance, \$648,800; new projects, \$2,358,388; flood protection maintenance, \$778,560; flood protection, new works, \$389,280. Other canals opened after the War were the Yousoufieh to serve Bagdad, the

New Khalis from the Dial River, the Beni Hassan, and the Georgivah, both from the Euphrates. Agricultural experiments indicated the feasibility of cultivating cotton, tobacco, and ground nuts. Dates, as always, figured in the economic life of the country, and sheep were tended in the Mosul region. The lack of farm labor and limited funds retarded development. Local industries, concerning themselves with tanning and weaving, were to be found in the towns. Into the export trade, dates, grains, carpets, and wool, of the native products, entered largely, while piece goods, carpets, sugar, and tea were reexported from Bagdad particularly via the caravan routes. After the War cotton goods made up nearly half the total imports, the depletion of stocks and the demands from Persia because of the closing of the northern routes accounting for the increase. Other imports were sugar, coming via India from Java and China and destined for Persia and Mesopotamia (11 per cent of total in 1919); tea from India and Ceylon for Persia (3.5 per cent of total in 1919); silk (3.5 per cent of total in 1919); tobacco; metals and ores; soap. Total imports at the port of Basra for 1912, 1919, and 1921 were £2,653,000, £9,326,000, £7,237,000 (to this must be added the imports of Bagdad, 1919, £2,940,000; 1921, £6,470,000); total exports at Basra for 1912, 1919, 1921 were £3,246,000, £2,406,000, £1,898,000 (Bagdad, 1919, £4,940,000; 1921, £4,658,000).

**Communications.** River transportation continued to occupy a prominent place even after the War; particularly extensive improvements were made in the Tigris. The navigation of the two rivers was, as before, controlled by a British company. Basra was the scene of great harbor developments as well. Up to 1914 the only railway line was the standard gauge branch of the Bagdad railway from Bagdad to Samarra (75 miles). However, military exigencies caused the construction of the following: Basra to Nasiriyah (140 miles), Basra to Amara (109 miles), Kut-el-Amara to Bagdad (105 miles), Bagdad to the vicinity of Khanikin (103 miles), and thence to the Persian frontier. The Bagdad railway line was extended to Tekrit, and then, after the Armistice, on to Qalat Sharqat (total 186 miles). In all, some 1100 miles of line were built for military purposes. An outstanding event was the opening of the line from Basra to Bagdad (354 miles) in January, 1920, which made possible a comfortable train ride of 22 hours from city to city. The line from Bagdad to the Persian frontier at once reduced freight rates and thus facilitated intercourse.

**Minerals.** Oil was reported to exist in rich quantities north from Mandali to Bagdad. The Anglo-Persian Oil Company obtained concessions to work some of these fields. Wells were sunk at Quaiyarah, but in 1923 the yield was still inconsiderable. Asphalt was found at Hit on the Euphrates.

**Government.** Revenues for 1918-19 were £2,080,000 and expenditures, £1,117,000; for 1919-20, revenues were £3,437,000 and expenditures £3,692,000. Customs revenue, which forms about half the annual receipts, amounted in 1920-21 to £1,426,288; 1921-22, £1,622,232. The British forces stationed in the country were under the control of the Air Ministry; the local Iraq army was in the process of formation. The constitution, as finally completed late in 1923, contained many liberal sections, at the

same time that it showed the restraining hand of British influence. The usual constitutional guarantees were given: freedom for race, religion, language, and of speech, assembly, and worship; the Emir, however, was sovereign and irresponsible, although all edicts were to be signed by the prime minister; there was to be a nominated senate and an elected chamber to which the ministry was to be responsible; validity was assured for the laws of the Ottoman régime and the British occupation, an arrangement interpreted by observers as applying to the oil concessions held by the Anglo-French Petroleum Company; and all concessions and monopolies were to be granted only in accordance with the law.

**History.** The Tigris-Euphrates valley, as rich in historic associations as in natural resources, had been a focal point for the conflicting imperialist aspirations of Germany and Britain from the very inception of the Bagdad Railway, at the close of the nineteenth century. In June, 1914, on the eve of the War, Great Britain and Germany reached a secret agreement, not published until 1923, whereby Basra was to become the terminus of the railway, navigation rights in Mesopotamia were reserved to the British, and irrigation in lower Mesopotamia was to be undertaken by Great Britain. About the same time, the two Powers agreed, and Turkey provisionally assented, that an Anglo-German syndicate, 75 per cent British and 25 per cent German, was to obtain a concession for exclusive oil prospecting in Mesopotamia. This bargain, however, failed to receive final approval before the outbreak of war in 1914. Even before Turkey entered the War, London ordered British troops to concentrate against Mesopotamia, in September, 1914, to occupy Abadan Island at the head of the Persian Gulf, and to take further belligerent measures if necessary to protect the Anglo-Persian Petroleum Company's refineries, tanks, and pipe lines in southern Mesopotamia. After Turkey declared war, Indian troops were disembarked on the shores of the Shatt-el-Arab, occupied the city of Basra, on Nov. 22, 1914, and advanced upstream. General Townsend's ill-starred campaign against Bagdad, General Maude's later and more successful attack on the city, and the other military operations of the War are described elsewhere (see WAR IN EUROPE, *Turkish Front*).

In the occupied area, the British zealously courted the favor of the native Arabs by making concessions to native customs, by tactful treatment of Mohammedan religious interests, and by more than generous promises to Arab nationalism. After occupying Bagdad, General Maude issued a proclamation inviting the people to participate in the government, so that they might unite with the Arabs of other regions in realizing their racial aspirations. Meanwhile, however, by the secret Sykes-Picot Treaty of 1916, Great Britain and France had made an anticipatory division of the spoils, assigning Mesopotamia to Great Britain. The unrati-fied peace treaty of Sévres (1920), and likewise the definitive treaty of Lausanne (1923), deprived Turkey of sovereignty over Mesopotamia; and the latter treaty left for future solution the problem whether Mosul should be included in the ceded area. The Mosul region was peculiarly attractive as an oil field reputed to be of vast value; it had been allotted to France

by the Sykes-Picot Treaty, transferred to England by another Anglo-French bargain in December, 1918, and included in the British mandate for Mesopotamia, notwithstanding Turkish protests on the score of self-determination. At the San Remo Conference of April, 1920, the Allies conferred on Great Britain a Class A mandate over Mesopotamia, and an Anglo-French oil agreement was concluded, whereby a 25 per cent share of the future oil output of Mosul was granted to France, and a pipe-line was to be constructed through Syria as an outlet for Mesopotamian oil. Against this oil agreement the United States government entered a vigorous protest, in a note dated Nov. 20, 1920; at the Lausanne Conference in 1923 the American delegation blocked a British attempt to obtain Turkish confirmation of the predominantly British Turkish Petroleum Company's monopolistic concession. The controversy regarding the Mosul oil field was further complicated by the Chester Concession (q.v.) and by claims advanced in behalf of Abdul Hamid's heirs. The British oil interests, it was unofficially reported, made efforts to conciliate Washington by quietly offering the several American claimants minor shares in Mesopotamian oil. In the meantime the uncertainty prevailing in regard to the future status of the country had encouraged the development of a strong nationalist agitation by young Arab officers, who quoted Wilson's speeches and various English and French manifestoes to prove Mesopotamia's right of self-determination. Popular antipathy to the efficiency of British tax collectors, to forced labor on irrigation works, and to British disregard of tribal and religious leaders, provided additional fuel for the smoldering fires of discontent which burst into open rebellion in 1920. The British army of 60,000 men had to be increased to 90,000 before the revolt was quelled, in December, 1920. Under these unfavorable circumstances the British endeavored to create the administrative machinery to fulfill their mandate. In the autumn of 1920 a Council of State was set up, under the tutelage of Sir Percy Cox, the British High Commissioner. Insistent Arab demands for a native government, reinforced by equally insistent protests by English taxpayers against the large military expenditures in Mesopotamia, whose cost, from the Armistice to the end of 1921, was estimated at £100,000,000, led the British government to consider favorably the claims of Prince Faisal (q.v.), son of the King of Hedjaz. The Council of State on July 11, 1921, unanimously offered him the crown, and after an almost unanimously favorable but hardly democratic plebiscite, 96 per cent for Faisal, he was officially proclaimed King of Iraq, at Bagdad, Aug. 23, 1921. The new kingdom of Iraq, nominally a sovereign state, was nevertheless subject to British supervision under the mandate, and to clarify this relationship, a treaty was signed on Oct. 10, 1922, by which Iraq agreed to be guided by the advice of the British High Commissioner in financial, military, and international matters, and Great Britain promised to facilitate Iraq's entry into the League of Nations, in due course. A subsequent protocol, signed Apr. 3, 1923, fixed the term of the earlier treaty, and implicitly of the mandatory relationship; the treaty was to terminate either on the entry of Iraq into the League or four years after the ratification of

peace with Turkey. The independence granted to Iraq was evidently of a very limited nature. The British continued to supervise native administration in the vital departments, a British Civil Administration continued to function temporarily side by side with Faisal's government, and the British Royal Air Force remained in military control of the country. In 1922, to give one instance of British policy, the minister of the interior was exiled to Ceylon because of his too pronounced nationalist views. The constitution or Organic Law drafted in 1923 and approved by the Council of Ministers made Mohammedanism the state religion and Arabic the official language, but assured equal civic rights to all, regardless of creed or race. Its political clauses provided the customary machinery of parliamentary government, with a responsible cabinet, but a sudden transition from Turkish oppression and tribal decentralization to genuine democracy, in a country with little popular education or political experience, could be hoped for only by the most optimistic of patriots. When the Constituent Assembly was inaugurated at Bagdad, Mar. 28, 1914, for the purpose of ratifying the Organic Law and the British treaty, strong opposition to the latter was promptly manifested. By this time it had become public knowledge that the treaty, with subsidiary agreements, including one dated Mar. 25, 1924, would enable Great Britain to maintain troops in Iraq until 1928 and perhaps longer; to train the native army, and to appoint administrative advisers for 15 years or more. The Arab kingdom, it appeared, was after all merely a British protectorate, confronted with political, educational, and financial problems of the utmost gravity but endowed with natural resources which might, under able management, enable the people to lay the economic and cultural foundations for genuine self-government in the future. On June 11, on the last day allowed the government by the British, the Iraq parliament approved the treaty and British control was accepted.

**MESTROVIĆ, IVAN.** See SCULPTURE.

**METALLURGY.** See COTTRELL PROCESS; ELECTRIC FURNACES.

**METCHNIKOFF, ELIE** (1845-1916). (See VOL. XV.) The death of the distinguished savant occurred at the age of 71. It appeared after his death that he had, whether by art or nature, overcome the handicap of short life which beset his near kin, none of whom had exceeded 55 years. He had drunk his artificially soured milk faithfully each day for 19 years and considered that his doctrines of survival had been upheld in his own case. His widow, Olga Metchnikoff, has written his biography.

**METEOROLOGY.** The decade 1914-24 witnessed a great expansion of the meteorologist's activities through increased emphasis on meteorology in military operations, aviation, agriculture, weather insurance, and numerous commercial and industrial fields. A prodigious advance was made in the organized collection and dissemination of weather information over land and sea by telegraph, cable, and radio. Daily synoptic charts now cover the larger part of the northern hemisphere, including the ocean areas, and the systematic exploration of the upper air by kites and pilot balloons has increased markedly in amount; appreciable improvement in daily weather forecasts has re-

sulted. Correspondingly rapid progress has been effected in theoretical meteorology.

By 1924 several capable physicists and mathematicians were at work on the foundations of weather forecasting, and order was slowly being evolved out of chaos, although as yet it was possible to supplement empirical knowledge of many phenomena with only partial explanations on physical and dynamic grounds. While the time seems remote indeed when forecasting can wholly cease to be an empirical art, nevertheless every advance, however small, in our theoretical understanding of the physical processes going on in the atmosphere provides increased insight which cannot fail sooner or later to react on meteorological practice and to lead to improvement in forecasting.

**Meteorological Observations.** To provide a solid basis for the improvement of day-to-day predictions, for the extension of forecasts over longer periods of time, and for the development of the mathematical theory of atmospheric phenomena, we need an adequate body of both surface and free-air observational data from land and sea, together with a skillful coördination of these facts of observation by the mathematician and physicist. Nothing can be done without sufficient observations, but facts do not as a rule explain themselves, and we cannot hope by simply looking at maps to reach the solution of our problems.

Moreover, there is no indication whatever that in order to reduce atmospheric phenomena to law it is necessary to discover new physical laws at present unthought of, or, despite the unfounded claims of some investigators, to seek the solution in some vague, hitherto unrecognized cosmic or electromagnetic influence.

**Observational and Statistical Meteorology.** The temperature of the air falls at an *average* rate, nearly the same in all parts of the world, of about 6°C. per kilometer increase of height up to an altitude which, according to latitude, season, and surface barometric pressure, varies from about 9 to 16 kilometers, beyond which the temperature ceases to fall in a vertical direction. This upper layer of zero lapse rate is called the stratosphere or isothermal layer; the lower region is known as the troposphere. The temperature of the stratosphere is below 200° Absolute over tropical regions, but is greater in higher latitudes and is above 220° Absolute over northern Europe. Roughly, the mean temperature of the air column from the surface to 20 kilometers is the same, and hence the pressure at 20 kilometers is the same, the world over. The diurnal temperature variation at the surface extends upward only one or two kilometers; the annual temperature variation in the troposphere diminishes somewhat with height and is quite small in the stratosphere. The tropopause, or boundary between troposphere and stratosphere, is relatively low in cyclonic areas, high in anticyclones.

To understand fully the weather of any given locality, and to anticipate its changes to any great extent in advance, it is necessary to take a worldwide view. Cold waves, periods of drought, abnormal seasons, etc., are intimately connected with the prevailing distribution of barometric pressure, and the resulting general circulation, over an entire hemisphere. Profound modifications of the pressure distribution are often first indicated in polar regions. Loss of heat from these regions results in the ac-

cumulation of great volumes of cold air which sooner or later must break out over lower latitudes and cause great periodical readjustments of pressure distribution over the hemisphere; and these in turn determine the winds, storm paths, and weather conditions in general.

So many factors are operating simultaneously and in such a complex manner to determine exactly what sequence of phenomena shall take place that it is hopeless to attempt to work out the relations involved *a priori* from theoretical considerations. Our immediate efforts must be directed toward ascertaining these relations empirically; the methods of mathematical statistics have come into extensive use for this purpose. The method of correlation has been used in the hope of empirically discovering relations which would be of value in long-range forecasting, but in general the correlation coefficients obtained up to 1924 are too small to render this method highly successful; prediction requires highly correlated variables. The present position of long-range forecasting in general is not at all hopeful; forecasts for more than a few days in advance, by whatever method, are made only at a great sacrifice of detail, and are most uncertain. Fair success has attended G. W. Walker's forecasts of the monsoon rainfall of India by the use of the correlation coefficients between the amount of this rainfall and sundry meteorological conditions over various parts of the globe in the spring of the same year or earlier. On the other hand, if correlation is resorted to only for the purpose of discovering relations between different phenomena, a small coefficient, if sufficiently larger than its probable error, is just as likely to give valuable information as a large one, although the interpretation of the coefficients frequently is difficult and uncertain, and the physical reasons for their existence impossible to assign.

The highest correlation coefficients found are those of Dines between pressure and temperature at the same levels in the upper air. Close to the surface the correlation between pressure and temperature is quite low, but from 4 to 8 kilometers the coefficients are well over 0.90, and when corrected for errors of observation some of them seemingly become unity, and this indicates direct proportionality between pressure and temperature at those levels. The surface temperature is governed by many factors, such as time of day, state of sky, etc., which higher up are absent or of lesser importance. Dines holds that the chief item in determining the temperature in the upper air is the dynamic heating and cooling due to vertical movement, while C. K. M. Douglas on the other hand maintains that the temperature variations in the upper air are mainly the result of the passage of different air currents, the temperatures of which depend on their place of origin and are low if the air comes from the far north, even though it may curve around a cyclone and arrive at the place of observation from the southwest.

Undoubtedly the relative importance of vertical motion and horizontal transport varies according to the geographic location of the place of observation and the height. From a summary of aërological data obtained in the United States, Gregg finds that south component winds are considerably warmer than north component winds at all levels in the troposphere, except when there is a temporary reversal in the

latitudinal temperature gradient or when the air follows a curved path around a cyclone or anticyclone, although the relation is somewhat more pronounced at one and two kilometers than above or below that height. A statistical study of kite data enabled Meisinger to devise a practicable and reliable method of constructing isobaric charts for the one and two kilometer levels over the eastern United States at 8 A.M. from surface data alone.

**Climatic Changes.** Some investigators hold that the earth is undergoing a gradual desiccation, but the consensus of the most expert meteorological judgment is that there is not as yet sufficient unimpeachable evidence to justify a belief in any progressive change of climate within historic times in any part of the world. Small and more or less periodic fluctuations, such as those accompanying the sunspot cycle, now exist, and can be traced back into the past through the evidence afforded by growth rings in large trees and other things; and the existence of well-marked local fluctuations of climate in the past is well established. So far as climatic changes during geologic time are concerned, there is a decided tendency to seek their explanation in purely terrestrial causes, with a lessened appeal to astronomical factors. The work of Humphreys and others has shown that dust veils in the very high atmosphere due to great volcanic explosions are effective in somewhat diminishing earth temperatures and may have been a contributing cause to the ice ages.

**Atmospheric Circulation.** At first sight it might seem natural that the motion of air should be directly from regions where barometric pressure is high to regions where it is low, but the most casual examination of a weather map shows that this is not the case; it is indeed the primary tendency, but this tendency is almost completely checked by the effect of the earth's rotation, and we get instead a circulation practically *parallel to the isobars*. The only forces acting on a particular volume of air are gravity, hydrostatic pressure, arising from the action of gravity on the rest of the earth's atmosphere, and friction, including internal friction due to viscosity and turbulence. The acceleration of the air under these forces is composed of two parts, acceleration relative to the surface of the earth, which is observable, and acceleration common to this surface itself, the latter giving rise to the so-called deflecting force of the earth's rotation. After a steady state has been attained, which takes but a brief time, *in the absence of friction* the direction of the wind is *along* the isobars, and the velocity is so adjusted that the force arising from the pressure gradient, tending to push the air in toward the region of low pressure, is just balanced by the tendency of the moving air to turn to the right, in the northern hemisphere, because of the earth's rotation, together with the outward tendency due to the centrifugal force arising from the curvature of the path. This resulting wind is known as the *gradient wind*. In the strata near the ground the retardation due to friction causes the air to lose some of the velocity necessary to maintain the balance, and the wind direction is more or less inclined away from the isobars toward the lower pressure.

If, as in lower latitudes, the influence of the earth's rotation is relatively small and friction is negligible, the pressure differences between

points at the same level in the atmosphere are mainly occupied in producing acceleration relative to the ground in accordance with the ordinary laws of hydrodynamics; that component of the gradient wind determined by the centrifugal force known as the cyclostrophic component is alone important as soon as the wind reaches a very moderate velocity. Such winds, which have been called Eulerian by Jeffreys, are exemplified in the tropical cyclone. If, as is generally the case in the comparatively slow-moving extratropical cyclone, the cyclostrophic component is negligible, the pressure differences are mainly occupied, in the absence of friction, in guiding the air under the influence of the earth's rotation; the resulting winds are known as geostrophic. If, as in land and sea breezes, friction is the main thing which the pressure differences have to overcome, the winds blow in the direction of the gradient, but without acceleration, and have been styled by Jeffreys antitriptic winds.

In the absence of direct observation, the gradient wind indicated by the surface pressure chart is the best estimate which can be given of the actual wind at an elevation of 1500 feet. For much greater heights, the surface map may fail to give a correct idea of the pressure distribution there. The law of approach from the surface wind to the undisturbed gradient flow above is very complex; a number of empirical formulas have been devised to express the variation of velocity with height in the lower levels; the best of these is probably one due to Chapman. The greatest insight into the motion of the air in the lowest strata has been given by the mathematical theory worked out since 1914 by G. I. Taylor, L. F. Richardson, F. J. W. Whipple, and others.

Friction and surface irregularities put the lower air into a very turbulent state; whirls and eddies of varying sizes are constantly being formed and reveal their presence in the gustiness of the wind and in the dispersion of the smoke from a chimney. While the spin of an eddy is maintained, the mass of air composing it is endowed with a special forced motion, but presently the eddy disintegrates, and the air which has been forcibly transported in the eddy mixes with its new surroundings. The result, even in the lightest wind, is the mixing of adjacent layers of air; the air transported by the eddies carries with it its momentum, heat, and water vapor, and thus the eddy motion causes a gradual diffusion of these in accordance with laws identical in form with those governing the diffusion caused by molecular motions. The lower layers gain in momentum and generally in heat, at the expense of the upper; the effect is to endow the lower atmosphere with a virtual or pseudoviscosity many thousand times greater than the ordinary molecular viscosity, and with a correspondingly great eddy conductivity for heat and for water vapor. The values of these coefficients of eddy conductivity and eddy viscosity depend on the configuration and nature of the ground surface, the temperature of this surface, the time of day, season, cloudiness, etc. Above the first one or two kilometers the influence of surface turbulence may generally be regarded as eliminated. Eddy motion or atmospheric turbulence has been found to play an important part in the diurnal and seasonal variations of wind velocity, and in the formation of clouds and fog.

**Cyclones.** The instantaneous picture provided by the synoptic chart gives no indication of the true trajectories of the moving air; when these trajectories are worked out by special investigations, it is found that the cyclone is not composed of the same air circulating round and round the centre as the storm travels. Also, the maps show no signs of the distribution of temperature, wind, etc. which the existence of a vortex would imply; hence for some time the old vortex theory of extratropical cyclones has been in disfavor. Nevertheless, a vortex theory can be made to account for many facts of observation, and it may be shown that under the actual circumstances of the case it would be difficult or impossible to recognize the presence of a vortex, particularly from the surface map, even if one existed.

We know that the air is full of imperfect whirls or eddies of all sizes; and Fujiwhara has recently shown that under suitable circumstances large vortices are built up through the absorption of the energy of the numerous small whirls into whirls of the next larger size, and so on, and similarly a large vortex dissipates by successively developing series of vortices of the next lower order. Rayleigh in 1917 showed that, provided there were already some vorticity

in the atmosphere, all that was necessary to effect the development of a single large vortex was the removal of air from the region that would form the core. Thus the initial step of adding energy to the existing small imperfect vortices which we know to be in the air could be effected by removing a part of what would be the central portion of the resulting cyclonic vortex.

The old thermal convection theory of cyclones, which postulated the ascent of a large body of air as a coherent mass, is untenable, because it does not explain the observed relative coldness of the troposphere in cyclones. Sir Napier Shaw has suggested instead, as the process of the required removal of air, its eviction by a scouring action in the layers through which penetrative convection passes. The rising air drags up with itself a surprisingly large portion of these layers through eddy mixing; this might account for the development of a cyclonic vortex attended by a reduction of pressure and a consequent lowering of the temperature. Shaw's theory seems quite applicable to tropical cyclones, and appears capable of accounting for some at least of the extratropical ones.

On the other hand, the meteorologists of the

Vertical Section to South of Center

THE STRUCTURE OF THE NORMAL CYCLONE ACCORDING TO V. BJERKNES

Meteorological Institute at Bergen, Norway, have brought to light details of cyclonic phenomena, not known before, which have led them to quite another conception of the nature of an extra-tropical cyclone. Deprived of weather telegrams from the greater part of Europe during the War, the Norwegian meteorologists found their isobaric charts, which covered only a very limited area, of comparatively little use for forecasting, and they were led to a serious attempt to use in practice a method of forecasting which V. Bjerknes had originally evolved from theoretical considerations. Detailed reports from a very close network of stations revealed the existence in the normal cyclone of two lines of discontinuity, meeting at the centre and dividing the cyclonic area into quite unequal portions. These

the two fronts, apart from wet fog or drizzle, is attributed to the local instability of air passing over warmer sea or land; it is particularly prominent over the land in summer and over the sea in winter.

Detailed maps show that the line of discontinuity formed by the warm and cold fronts together extends continuously from cyclone to cyclone. After extensive experience with detailed maps, it becomes possible to recognize the line on less detailed ones; it is then found that the line completely surrounds the entire polar regions, and the name Polar Front has been given to it; the air on the northern side is of polar origin, that on the southern side of tropical origin. Heavy cold air flows out along the ground from polar regions, separated from

FRONT OF POLAR AIR, DEC. 31, 1906.

The rainstorm which is occurring near the Great Lakes arrived at the coast of Norway on Jan. 5, 1907.

two lines mark the boundary of a projection of warm air, generally from the southward, into a region of cold air. The line running from the centre towards the eastern or advancing side is called the steering line, or more recently the warm front; under normal conditions it is marked by a rise of temperature, preceded by a considerable and prolonged fall of rain. The other line, running from the centre in a south-westerly direction, is called the squall line, or cold front; it is marked by a sudden fall of temperature accompanied by a brief shower of rain.

The cyclone is thus divided into a warm sector and the cold remainder. The lines of discontinuity have been explained as delineating the ground plan of a complicated surface of discontinuity which extends up into the free air and separates cold air of northern origin from warm air of southern origin. The rain in advance of the warm front is attributed to the general ascent of the warm air from the south up over the bank of cold air to the north, along a gentle slope; and the rain of the cold front is attributed to the undercutting of the warm air by the cold air in its rear with a somewhat steeper surface of separation. Rainfall in regions outside the two which are associated with

the overlying warm air by a surface of discontinuity. The Polar Front has a wavy form, cold and warm tongues of air alternately extending toward equator and pole and is in continuous undulating motion, sweeping the whole temperate zone from west to east, and producing the weather changes of temperate latitudes. At the northern ends of the warm tongues are the centres of the cyclones; the broad tongues formed by the expulsion of great masses of accumulated polar air are the anticyclones between. If a tongue of warm air extends too far, and a portion of equatorial air gets completely surrounded at the ground by colder air, the cyclone fills up and expires, and a secondary may develop at the point of overlapping of the two cold fronts. The poles are not of course the only possible sources of a discontinuity; the northern slopes of the Asiatic continent are an effective substitute, both winter and summer.

The above empirical representations of the facts of the synoptic charts have already proved of quite material assistance to forecasting in Norway. Bjerknes has, in addition, sought to give them a dynamic interpretation. He holds that the synoptic maps can be simulated by wave motion on either side of the surface of discontinuity. The discontinuity is considered

a natural consequence of the dynamic conditions of an atmosphere on a rotating globe. The cyclonic depressions of middle latitudes begin as convolutions of the surface of discontinuity due to the instability of adjacent warm and cold air in relative motion. At sea level they appear as collections of approximately circular isobars because the surface of discontinuity is not vertical but tends toward parallelism with the axis of the earth or even less inclined to the surface than this. The successive cyclones of the temperate zones are thus regarded as waves on the boundary surface between the cap of polar air and the surrounding warm air masses. The corresponding boundary line at the ground, the Polar Front, traverses the centres of depressions all the way around the earth. The extreme northern ends of the warm waves coincide with the centres of low pressure, and the cold waves of polar air between them constitute the moving wedges of high pressure. The examination of depressions individually, from their formation to their disappearance, shows that young depressions correspond to slight waves with small excursions from the equilibrium state; later, the amplitudes increase simultaneously with a deepening of the depression. The ascending currents starting from the warm wave gradually diminish the area of the warm sector of the cyclone. The tongues of polar air on both sides of it accordingly approach each other and finally close together, so that air of cold origin surrounds the cyclonic centre on all sides. The potential energy of the system of adjacent cold and warm air masses is then lost, and the cyclone begins to fill up. The missing asymmetry of structure makes the cyclone during its last stages slow-moving or stationary.

The warm, cold, and occluded fronts are now shown on the Norwegian weather maps, and forecasts are made in accordance with the principles of the Polar Front theory. In spite of

of both the vortex and the polar front theories, is needed. Alternative conceptions of the mechanism of extratropical cyclones recently put forward by Kobayasi and by Ryd lead to the squall line as a consequence, not a cause, of the cyclone.

**Meteorological Tides.** The Tidal Institute of the University of Liverpool, founded in 1919, did much valuable work looking toward forecasting the effects of winds and barometric pressure on tides and on the level of the sea in general. Hayford succeeded in evaluating the effects of winds, pressure, and seiches on the levels of the Great Lakes.

**Mathematical Meteorology.** As a matter of research, Bjerknes and his colleagues have tried to formulate a mathematical theory of the general circulation of the atmosphere considered as a circumpolar vortex, on the basis of the polar front theory and the hydrodynamics of fluids in which the density is a function of other variables besides the pressure. Incidentally, they have also attempted to work out the course of the future weather in a limited region by mathematical calculations based directly on physical laws applied to initial data as complete as possible, mainly by employing graphical methods to solve the differential equations which embody atmospheric processes. L. F. Richardson, in an admirable study of theoretical meteorology, has coördinated practically every physical and dynamic process of the atmosphere in one systematic set of differential equations and has applied the calculus of finite differences to obtain an approximate analytic solution which might be employed in computing the coming weather. The value of the insight into the mechanism of atmospheric phenomena which such studies provide cannot be overestimated, but of course the calculations of coming weather by such methods are so prohibitively laborious, and the available observational data on which to base them are so imperfect and incomplete at best, as to preclude any thought of the immediate direct application of such methods in practical forecasting.

**Miscellaneous.** Valuable studies of the radiation of the sun, the nocturnal radiation of the earth, the return sky radiation, and atmospheric radiation have been carried out by Abbot and his colleagues, Dorno, Ångström, Boutaric, Kimball, and others. Brunt has estimated the total kinetic energy of the general circulation to be  $3 \times 10^{27}$  ergs, and the rate of dissipation to be such that 2 per cent of the effective incoming solar radiation must be converted into kinetic energy to maintain this circulation. Clayton, in Argentina, has made the variations of the solar constant a basis for forecasts; but the claim that fluctuations in the solar constant are responsible for all weather changes can hardly be substantiated. What connection, if any, exists between changes in solar radiation and any special weather conditions that may follow remains to be established. Vegard has concluded that auroras are produced by streams of negatively electrified particles (presumably from the sun) passing through the high atmosphere. The lower limit of the aurora is most frequently found at 100 or at 106 kilometers. Streamers extending to an altitude of 500 kilometers have been observed. Vegard's observations indicate that all the lines of the auroral spectrum, including the enigmatic green line, are due to nitrogen.

In a new study of the composition of the up-

its great successes in correlating many of the facts of cyclonic phenomena, the theory has not been completely confirmed by such observations as are available to test it, nor is it altogether free from theoretical difficulties. Considerable further investigation, along the lines

per air, Chapman and Milne conclude that up to 110 kilometers nitrogen composes more than half the air, then becomes less predominant, until at 200 kilometers helium alone is present. Vegard's work on the aurora and its spectrum has led him to conclude that nitrogen is predominant to the very top of the atmosphere. Vegard's observations of auroras, as well as Lindemann and Dobson's study of the phenomena of meteors, indicates that the density of the atmosphere above 60 kilometers must be much greater than was formerly supposed. The latter account for this density by postulating a temperature of 300° Absolute for the air between 60 and 160 kilometers, brought about by the absorption of solar radiation in the ozone layer, but Vegard finds this incapable of explaining his observations and favors the hypothesis that the nitrogen is kept up by virtue of existing in the upper strata in the form of fine solid crystalline dust which is highly positively electrified through the photoelectric action of the short wave length solar radiation.

**Scientific Organization.** Existing international scientific organizations were disrupted by the War. In 1919 the International Research Council was formed to effect international cooperation in scientific work. A section of the International Geodetic and Geophysical Union of this Council is devoted to meteorology. The second meeting was held at Rome in 1922.

**Necrology.** The following eminent meteorologists died between 1914 and 1924: Henrik Mohn, Sept. 12, 1916; Cleveland Abbe, Oct. 30, 1916; Max Margules, Oct. 4, 1920, and Julius von Hann, Oct. 1, 1921.

**Bibliography.** New books of importance on meteorology were: R. G. K. Lempfert, *Meteorology* (London, 1920); C. F. Talman, *Meteorology* (New York, 1922); Sir Napier Shaw, *Forecasting Weather*, 2d ed. (London, 1923); W. J. Humphreys, *Physics of the Air* (Philadelphia, 1920); F. M. Exner, *Dynamische Meteorologie* (Leipzig, 1917); L. F. Richardson, *Weather Prediction by Numerical Process* (Cambridge, 1922); J. Hann, *Lehrbuch der Meteorologie*, rev. by R. Süring, 4th ed. (Leipzig, 1923); W. J. Humphreys, *Weather Proverbs and Paradoxes* (Baltimore, 1923); W. Köppen, *Die Klimate der Erde* (Berlin and Leipzig, 1923); W. G. Kendrew, *Climates of the Continents* (Oxford, 1922); A. E. Douglass, *Climatic Cycles and Tree Growth* (Washington, 1919); *Smithsonian Meteorological Tables*, 4th ed. (Washington, 1918); J. W. Smith, *Agricultural Meteorology* (New York, 1920); J. M. Pernter and F. M. Exner, *Meteorologische Optik*, 2d ed., (Vienna and Leipzig, 1922). See PHYSICS; EARTHQUAKES; SEISMOLOGY.

**METEORS.** See ASTRONOMY.

#### **METHODIST EPISCOPAL CHURCH.**

In 1924 there were about 15 different divisions of Methodists, aggregating about 8,000,000 members. The Methodist Episcopal Church was the largest branch. In the United States the membership increased from 3,566,542 in 1914 to 4,336,841 in 1923, the number of ministers from 17,804 to 18,706, and the number of churches from 26,296 to 26,621. The Sunday schools in 1914 numbered 26,840 with an enrollment of 3,746,521; in 1923, 26,345, with an enrollment of 4,366,529. The membership throughout the world increased during the same period from 4,161,306 to 4,952,212. Included in affiliation with the church in the United States was the

work in Denmark, Finland, Korea, China, Norway, Germany, Sweden, Switzerland, Italy, Mexico, Philippine Islands, and several countries in South America. In addition to these mission stations, there were grouped mission conferences in Austria, Bulgaria, Jugo-Slavia, Africa, Netherlands India, Porto Rico, Rhodesia, France, Russia, Alaska, Hungary, and Hawaii. Much of this work was carried on throughout the decade 1914-24 by the Board of Foreign Missions and the Women's Foreign Missionary Societies. The church had 80 hospitals, and during the year 1923 it cared for 148,000 persons. There were, in 1924, 38 homes for the aged and 45 for children. One of the great boards of the church, the Board of Pensions and Relief, had under its immediate care over 8000 retired ministers, ministers' widows, and ministers' orphans under 16 years of age. The annuity claim of this great company was about \$3,375,000 a year. The council of the boards of benevolence between 1920 and 1924 handled over \$66,000,000, which went to the home and foreign fields. In the United States there were 196 colleges, universities, and secondary schools, with over 89,000 students. Outside the United States, in the mission fields, were schools of all kinds, aggregating 3849, with 163,000 pupils. The publishing interests of the Methodist Episcopal Church were conducted by the Methodist Book Concern, which had three publishing plants, at New York, Cincinnati, and Chicago. Average sales were over \$5,000,000 a year.

After many years of effort to join the Methodist Episcopal Church and the Methodist Episcopal Church South, an agreement for union was reached and put before the General Conference of the Methodist Episcopal Church at Springfield, Mass., in 1924, which voted 802 to 15 in favor of the unification plan as agreed on by the Commission of the two churches. This led to the calling of a special session of the General Conference of the Church South, meeting July 2, 1924, at Chattanooga, Tenn.; after three days of vigorous debate, a vote taken on July 4 was 297 to 75 in favor of unification. In August, 1924, the plan had yet to go before the annual conferences of the churches of the South and North; if they gave it a two-thirds majority, unification would then be in effect; and the two General Conferences would be called to meet together.

#### **METHODIST EPISCOPAL CHURCH,**

**SOUTH.** This branch of the denomination came into existence in 1845 through a division of the original Methodist Episcopal Church by General Conference action in 1844 when it became evident that the church could not find a policy on slavery acceptable to both sections of the country. It is the second largest branch of the church. The number of communicants increased from 1,996,877 in 1914 to 2,418,336 in 1923; the number of churches from 17,006 to 17,504; and the number of traveling preachers from 7203 to 7970. The number of Sunday-school pupils rose from 1,479,977 to 2,050,137; officers and teachers from 134,930 to 162,439; and members of the Epworth League from 133,380 to 247,552. The denomination maintained a large number of educational institutions, chiefly in the South, comprising 29 universities and colleges, 28 junior colleges, one Bible and Missionary Training School, 28 academies, and 8 mission schools. Its Board of Missions superintended missionary work in Brazil, Mexico,

China, Japan, Korea, and the Congo. Through the Centenary Movement projected in 1918, \$50,000,000 was raised for missionary work, and through the Christian Education Movement, inaugurated in 1920, \$20,000,000 was raised for educational work. A plan to unite the two largest branches of American Methodism was accepted by the General Conferences of both branches. Headquarters were in Nashville, Tenn.

**METHODISTS, CANADIAN.** Five organizations in Canada similar in their beliefs, the Methodist Episcopal Church, the Wesleyan Methodist Church, the Primitive Methodist Church, the Methodist New Connection Church, and the Bible Christian Church, united to found the Methodist Church in Canada in 1883. Besides Canada and Newfoundland, the denomination has churches in Bermuda affiliated with it. The organization and administration of the church is effected through 12 Annual Conferences, subdivided in many districts. The membership increased from 376,761 in 1915 to 407,264 in 1923, but the number of ministers declined from 2871 to 2106, the number of Sunday schools from 3824 to 3754, and the number of pupils from 420,210 to 407,264; the number of teachers and officers increased from 41,929 to 43,334. The denomination had under its supervision 17 colleges and universities. Foreign missions were maintained in China and Japan.

**METHODISTS, COLORED.** The Colored Methodist Episcopal Church was organized in 1870 as a separate body under the oversight and care of the Southern Church. According to statistics published by the denomination, the membership increased from 275,000 in 1914 to 366,315 in 1922; the number of preachers in 1914 was about 3000, compared with 3039 ministers and 2590 lay preachers in 1922. The number of pupils in the Sunday schools increased from 79,876 in 1917 to nearly 193,000 in 1922, and officers and teachers increased from 7098 to 18,884; Sunday schools fell from 4007 to 2543. Churches increased from 3000 to 3824. The denomination supported nine colleges and published three periodicals.

**METHODISTS, WESLEYAN.** The mother church of the denomination and the principal branch in Great Britain and Ireland. It was founded in 1729, the first society was formed in 1739, and the first conference held in London in 1744. The church in 1924 was composed of five main conferences: Great Britain, Ireland, Foreign Missions, France, and South Africa. The membership figures of the denomination showed an increase from 922,796 in 1915 to 933,167 in 1923; the number of churches grew from 17,671 to 18,081, and the number of lay preachers from 30,221 to 33,549. The Sunday schools increased from 10,794 to 11,312, but the number of pupils dropped from 1,121,682 to 1,055,699, and the number of officers and teachers from 143,182 to 133,431. A publishing house was maintained in London.

**Primitive Method Church.** Known in England as the Camp Meeting Methodists. Church membership increased from 206,812 in 1915 to 210,923 in 1923, but the number of churches fell from 4903 to 4623, the number of ministers from 1149 to 1091, the number of lay preachers from 15,537 to 13,939, and the Sunday schools from 4204 with an enrollment of 447,050, to 4026 with an enrollment of 419,632.

**United Methodist Church.** Membership in this denomination rose from 185,769 in 1915 to 186,257 in 1923, the number of churches from 3013 to 3043, the number of lay preachers from 6156 to 13,939; and the ministers decreased in numbers from 848 to 745, the Sunday schools from 2286 with 294,039 pupils and 40,744 officers and teachers, to 2216 with 274,056 scholars and 38,422 officers and teachers.

**Wesleyan Reform Union.** This denomination remained fairly stationary during the decade. Its membership in 1915 was 8526 as compared with 8593 in 1923, the number of churches (206) was the same in both years, the ministers numbered 25 in 1914 and 24 in 1923, and the lay preachers 500 in the earlier year and 432 in the latter. The Sunday schools numbered 195 at the beginning of the decade and 196 at the close.

**Independent Methodist Churches.** Membership of this denomination increased from 9215 in 1915 to 9639 in 1923, while the number of churches decreased from 163 to 144 and the ministers from 411 to 374.

**Australasian Methodist Church.** This denomination increased in membership from 149,878 in 1915 to 160,911 in 1923, while the number of churches dropped from 5147 to 4706 and the lay preachers from 8634 to 8218.

**New Zealand Methodist Church.** This denomination showed a slight decline during the years between 1915 and 1923. Its membership dropped from 24,218 to 22,916, its ministers from 198 to 181, lay preachers from 928 to 774, Sunday schools from 411 to 405 and pupils from 29,917 to 29,154. The number of churches, however, rose from 459 to 825.

**Japan Methodist Church.** Church membership increased from 13,838 in 1915 to 22,000 in 1923, and church buildings from 245 to 337, but the number of ministers decreased from 232 to 230.

**METROPOLITAN OPERA HOUSE.** See *MUSIC, Opera.*

**METZLER, WILLIAM HENRY** (1863- ). An American mathematician, born at Odessa, Ont., and educated at Toronto and Clark Universities. From 1892 to 1894 he was instructor in mathematics at the Massachusetts Institute of Technology and then accepted a call to Syracuse, where in 1896 he became Francis H. Root professor of mathematics and head of the department. During 1911-17 he served as dean of the Graduate School and in 1921 became dean of the College of Liberal Arts. Professor Metzler's original investigations, on which he published important results, included studies on symmetric functions, vanishing aggregates, and compound determinates. He served as editor of *The Mathematics Teacher* and the *Journal of Pedagogy*.

**MEXICAN BEAN BEETLE.** See *ENTOMOLOGY, ECONOMIC.*

**MEXICO.** A republic of North America with an area of 767,168 square miles, almost equal to the combined areas of Great Britain and Ireland, France, Germany, and Austria. Its total population of 14,100,000, according to the 1921 census, is 30 per cent less than the combined populations of New York and the New England States. Mexico City is the most important centre, with a population over 900,000. It is the capital of the republic and the chief centre of manufacturing, trade, and banking interests. Other important cities are: Guadala-

jara, 149,308, a railway, manufacturing, and agricultural centre of the west coast; Puebla, 101,000; Tampico, 94,378, the most important oil centre and second port of the country; Monterey, 81,000; San Luis Potosi, 83,000; Vera Cruz, the chief port, 75,000; Merida, capital of Yucatan, 62,000; and Chihuahua, 48,310.

**Industries.** Mexico was known during 1914-24 principally for its enormous mineral resources, but a very noticeable movement from the rural to the urban centres was apparent, and Mexico was becoming more and more a manufacturing nation. Before the outbreak of the 1910 revolutions, Mexico was the leading industrial nation in the Western Hemisphere, south of the United States.

**Petroleum.** Prior to 1910, mineral oil was a very small factor in the economic life of Mexico. In that year, the total oil production was 3,634,080 barrels. By 1914 it had jumped to 26,235,403 barrels, an increase of over 700 per cent. Despite political disturbances, which damaged all other industrial enterprises, petroleum production increased steadily from 1914 to 1921, when the peak of production was reached with an output of 193,397,587 barrels, valued at \$182,936,817. Because of exhaustion of old wells and the uncertainty of property ownership, production in the next two years was less. The 1922 production was 182,278,457 barrels (\$167,397,872); 1923, 149,529,088 (\$142,916,885). Total production since 1901, when the first well was brought in, was 1,055,257,562 barrels, valued at \$828,241,710. (All conversions are made at the rate of two Mexican pesos to the dollar.) Mexico was the second largest petroleum producer in the world, standing second to the United States. In 1923, the United States produced 735,000,000 barrels; all other countries except Mexico, 116,000 barrels. Only about 15,000 acres of oil land were exploited in Mexico, while many thousands of acres more were said, on good authority, to contain oil deposits.

**Mining.** The mineral resources of Mexico were enormous. Except for a short time during the most disturbed period of the revolution, Mexico was the leading silver producing country in the world. The Spaniards worked the silver mines in the early part of the sixteenth century, and the natives before them. The principal minerals were silver, gold, copper, lead, iron, and zinc, although there were also deposits of coal, platinum, mercury, manganese, antimony, sulphur, bismuth, and graphite. The five most important minerals produced in Mexico were silver, gold, copper, lead, and zinc. In 1914, production in general was at an extremely low ebb. After that year there was a very noticeable revival of production; the year 1923 marked a decided increase over previous years. Production in metric tons for 1914, compared with 1922 and 1923, follows:

| Mineral      | 1914   | 1922    | 1923    |
|--------------|--------|---------|---------|
| Gold .....   | 8.6    | 23      | 24      |
| Silver ..... | 811    | 2,522   | 2,825   |
| Copper ..... | 36,337 | 26,978  | 53,372  |
| Lead .....   | 20,350 | 110,456 | 155,721 |
| Zinc .....   | 4,620  | 6,142   | 18,481  |

**Agriculture.** About 5 per cent of Mexico's total area was available for agricultural purposes. Principally as the result of the applica-

tion of so-called agrarian reforms, production decreased greatly in the decade, and large quantities of food crops were imported annually into Mexico. The principal crops raised were corn, wheat, beans, sisal, and cotton. In 1914, production of food crops in Mexico was as follows: corn, 1,992,555,000 kilograms (106,203,181 pesos); wheat, 119,440,000 kilos (9,555,200 pesos); beans, 142,325,357 kilos (15,665,809 pesos). Importations during 1914 were: corn, 1,268,262 kilos (92,444 pesos); wheat, 4,222,737 kilos (30,814 pesos); beans, none. The 1922 production (last year for which official figures were available) was: corn, 1,773,905,089 kilos (104,034,305 pesos); wheat, 370,844,541 kilos (44,501,345 pesos); beans, 115,187,942 kilos (16,123,312 pesos). Imports during 1922 were: corn, 83,906,485 kilos (5,032,111 pesos); wheat, 5,912,812 kilos (548,546 pesos); beans, none. In 1923 the corn crop was exceptionally large, wheat was short, and the bean crop about the same as in 1922. Of the commercial crops, sisal and cotton were the most important. Sisal production in 1922 was 122,400,000 kilograms, and cotton, 38,644,932 kilograms. In 1923, cotton production declined to 27,029,318 kilos, while early 1923 reports indicated the estimated henequen (sisal) crop would be 156,750,000 kilos. The henequen crop for 1924 was estimated before the outbreak of the revolutionary disturbances of December, 1923, at 175,000,000 kilos. The cotton crop in 1924 was expected to be much larger than that of the past few years.

**Manufacturing.** Manufacturing in Mexico was limited but growing. The textile industry was, in 1924, the most important. In 1923 the Mexican textile mills consumed over 70,000,000 bales of raw cotton. On Oct. 31, 1923, the total investment in buildings and machinery alone was \$36,054,000. A total of 140 mills, of which 108 were in operation, employed 38,232 hands. The total sales effected during the six-month period, May 1 to Oct. 31, 1923, were valued at \$23,878,000. Other important manufacturing industries were boots and shoes, with an average annual production of over 700,000 pairs; lumber works; flour mills, of which there were 82 in operation in 1922, with a total capital investment of over \$6,000,000; hat factories, producing annually about 800,000 pieces; many chemical industrial establishments, producing some 25,000 tons of laundry soap, 4300 tons of candles, thousands of quarts of turpentine, varnish, etc., annually. Five cement factories had a total annual capacity of 310,000 metric tons. Various difficulties kept native production down, and large amounts had to be imported annually. Some 235 mills produced 121,000 metric tons of sugar in Mexico in 1923.

**Commerce.** The last year for which official figures were available was 1922. Imports then were valued at 303,808,370 pesos, and exports, including petroleum, at 865,933,272 pesos. (Two pesos equal one dollar.) In 1913, imports were valued at 192,292,462 pesos and exports at 300,405,552 pesos. It was significant that despite disturbed political conditions, Mexico's trade was maintained throughout the long period of revolutions. The year 1915 marked the lowest level; imports were 52,821,306 pesos and exports 251,202,988 pesos. Figures for the first six months of 1923 were: imports, 150,167,740 pesos; exports, 123,853,703, showing a distinct falling off in exports as compared with imports.

The highest trade totals were registered in 1921, when imports were 508,074,097 pesos and exports 728,227,156. It is interesting to note that in 1921, United States exports to Mexico had a value four times as great as the exports of 1910, the last normal year in Mexico. Based on United States exports to Mexico in 1910, 1921 exports of cattle were over 25 times as large; rice, 21 times as large; wheat flour, 12 times; corn,  $3\frac{1}{2}$  times; cotton manufactures, 15 times; iron and steel products,  $4\frac{1}{2}$  times; and meat and meat products, 4 times. Principal Mexican imports were textiles, foodstuffs, iron and steel products, and various manufactures. The leading sources of imports were the United States, Great Britain, France, and Germany. Principal exports were crude petroleum, raw minerals, henequen (sisal), coffee, vanilla, and cotton. The chief countries of destination were the United States, France, Great Britain, and Germany. In 1913, Mexican imports were divided as follows: the United States, 50 per cent; Germany, 13 per cent; Great Britain, 14 per cent; France, 9 per cent; all others, 14 per cent. In 1921, these percentages were: the United States, 67 per cent; Germany, 5 per cent; Great Britain, 9 per cent; France, 9 per cent; all others, 10 per cent. For the first half of 1923, Mexico's imports were divided as follows: the United States, 68 per cent; Germany, 11 per cent; Great Britain, 8 per cent; France, 4 per cent; all others, 9 per cent.

**Pastoral Activities.** In 1923, the live stock census taken by the government showed a general decrease of approximately 60 per cent in all live stock as compared with 1902, the year in which the last previous census had been taken. Restocking of Mexico's once famous ranges proceeded to only a limited extent, largely because of the uncertainty of land tenure after 1917, and partly because of the lack of capital.

**Communications.** The period 1914-24 was marked by serious damage to all rolling stock in Mexico, the latest revolutionary movement, that of December, 1923, to May, 1924, adding to the general disruption owing to the fact that about half of the railroads in the country were in the hands of the revolutionaries. Beginning with the creation of the National Railways of Mexico in 1907, by which means the Mexican government acquired 55 per cent of the stock of many of the most important lines, government control was gradually extended until at one time practically all important lines in Mexico were merged into one system, controlled and operated by the government. Following that day, rumors were recurrent that the National Railways were to be returned to their former owners, but denials were always made. On Mar. 10, 1924, an official report gave the ownership of Mexican railroads as follows:

|                                                                   |                       |
|-------------------------------------------------------------------|-----------------------|
| National Railways (majority stock controlled by government, ..... | 13,205.495 kilometers |
| Government owned railways ..                                      | 516.765 "             |
| Private railways .....                                            | 7,529.195 "           |
| <hr/>                                                             |                       |
| Total kilometers in operation .....                               | 21,251.455            |
| Total in miles .....                                              | 13,282                |

One of the most important single companies listed under "private corporations" was the Mexican Railway, a British corporation, which

ran its main line from Vera Cruz to Mexico City, with a total mileage of 474 miles. This line was taken over in 1916, merged with the National system, and returned in 1920. There were 24 important shipping companies whose boats made regular stops at Mexican ports. Four of these companies were American, operating 19 vessels calling at Mexican ports; 1 Spanish, with 5 vessels; 2 Dutch, with 9 ships; 1 Italian, with 4 vessels; 2 Norwegian, 5 vessels; 2 English, 3 vessels; 2 Mexican, 17 vessels; 3 German, 6 vessels; 2 Czecho-Slovak; 1 Japanese, 9 vessels; 1 French, with 15 vessels; and 1 Argentine company, with 3 vessels. The principal ports were, on the Gulf, Vera Cruz, Tampico, Puerto Mexico, Progreso; on the Pacific, Mazatlan, Salina Cruz, Manzanillo, and Acapulco. Serious port strikes and revolutionary disturbances at Vera Cruz damaged the port's business greatly, particularly during 1923, and its eminence as the leading port of Mexico was from then on seriously menaced by Tampico. During 1923, the Mexican government proclaimed Puerto Mexico and Salina Cruz on the Isthmus of Tehuantepec, and Guaymas on the Pacific, free ports. Formal opening was delayed by the revolutionary outbreak of 1923-24. There were in Mexico 55,786 miles of government-controlled telegraph wires, operating 567 offices, and 17,667 miles of privately owned wire, with 825 offices. There were, too, 27 government wireless stations despatching 153,386 radiograms in 1921. The government also controlled 1181 miles of telephone wire, served by 9 offices; while private companies controlled 51,461 miles of telephone wire and 862 offices. In 1922, 82,982 telephones were in service.

**Finance.** Compared with 1911, government revenues in Mexico increased over 160 per cent, but expenses mounted in proportion. While the financial statements of the last two or three years of the period showed a favorable balance, no mention was made in these statements of unpaid current obligations and the many claims arising from losses suffered during the long years of revolutions and from current confiscations of lands under the various state agrarian laws. In the 1922 and 1923 statements, no provision was made for a sinking fund to meet either interest or principal of any of these numerous obligations. In 1911, total government receipts were 111,142,401 pesos and expenditures 100,913,923; in 1922 receipts were 277,567,019 pesos and expenditures 267,137,468. It is of importance to note that the 1911 financial statement provided for an expenditure of almost 29,000,000 pesos for the public debt, an item which was entirely omitted in the 1922 balance sheet. The 1911 statement showed expenditures of 20,434,155 pesos for the War Department, and this had jumped to 111,021,291 pesos by 1922, not counting an expenditure of 12,917,432 pesos for the army uniform factory.

All sorts of taxation were greatly increased, and the year 1924 was ushered in with a general income tax and an increase in practically all other Federal taxes, as the financial situation of the government was admittedly very serious. Various schemes for floating a loan in the United States were reported from time to time, but none materialized. Very important steps were taken in the last few years in Mexico towards a complete financial rehabilitation, and if political disturbances should cease Mexico

would soon be once more among the favored nations financially. One of these innovations was the de la Huerta-Lamont agreement, commonly called the Bankers' Agreement of 1922, which provided a plan for the refunding of Mexico's foreign debt. Under the terms of this agreement, 30,000,000 pesos were paid by the Mexican government to the Bankers' Committee in New York during 1923, and provisions were made for an increase of an additional 5,000,000 pesos yearly until, by the fifth year, 50,000,000 would be paid. Despite the very serious financial embarrassment of the Mexican government during the last months of 1923 and the opening months of 1924, the payments falling due in 1923 (30,000,000 pesos), as well as the first payments corresponding to 1924, were faithfully made. Another important step in the financial history of Mexico was the adoption of a budget system in 1922. Under that budget, revenues for 1923 were estimated at 278,000,000 pesos, and expenses at 297,000,000. Although no official figures were available, decreased petroleum production and consequent loss of revenue, plus the losses due to the closing of Vera Cruz and other sources of customs revenues, decreased the 1923 figures far below original estimates. It seemed likely therefore that despite the fact that many of the budgeted expenditures were contingent on funds being available, the years 1923 and 1924 would show considerable deficits.

The need of a circulating medium other than metallic currency was recognized in Mexico, but the abuses of overinflated paper currency, particularly during the years 1914-17, created a very strong feeling against that sort of circulating medium, and all paper money was excluded by law. Business was cramped in consequence. To remedy this situation, a sole bank of issue was projected, the opening of which was rumored and prophesied on many occasions. Important details of capitalization, and especially the question of control which the Mexican government wanted held in Mexico, had, to 1924, delayed formal plans. The banking crisis of 1922, when the important Banque Française du Mexique failed, drawing a number of smaller banks into bankruptcy with it, passed without the further serious economic disturbances which had at first been feared. Economic stringency limited practically all banking operations, and credit continued to be very restricted, and money tight. Compiled statements on the condition of Mexican banks on Oct. 31, 1923, showed the commercial banks with a total of 27,441,664 pesos cash on hand and total deposits of 85,104,510 pesos, while the banks of issue showed 14,045,729 pesos cash on hand and 35,586,575 pesos deposits, making a total of 41,487,393 pesos cash on hand and 120,691,085 pesos total deposits. The cash on hand was divided as follows: gold, 32,209,041 pesos; silver, 3,100,103 pesos; fractional silver currency, 5,834,577 pesos; and United States currency, 655,077 pesos. Mexico City predominated in commercial banking business, with more than 75 per cent of the deposits and an equal percentage of the total cash on hand.

**Education.** The school system in Mexico was largely under government control. From 1896, earnest attempts were repeatedly made to better the general standard; lack of funds and disturbed political conditions interfered seriously with projected improvements from 1910. Nevertheless, in 1922, the school budget amounted to

45,000,000 pesos as compared with 2,000,000 pesos in 1920 and 9,000,000 pesos in 1921. In 1907 there were 11,940 elementary schools supported by the national, state, or municipal governments, with 776,622 pupils, and 2499 private schools with 152,917 pupils. In 1922 these numbers were as follows: government primary schools, 8388; private, 1327 schools; 711,592 pupils in government schools; 108,183 pupils in private schools. The total number of teachers in 1922 was 20,407 in all primary schools. The highest per capita school attendance outside of the Federal District, which includes Mexico City, was registered in the extreme northern state of Sonora, and this was followed by Lower California, Coahuila, and Quintana Roo, in the order named. The lowest percentage of attendance per capita was in the State of Oaxaca. The Constitution of 1917 made school attendance compulsory for all children under 15 years of age. This same document forbade the establishment or direction of primary schools by religious bodies of any denomination, but there remained a comparatively large number of such schools established throughout the country. In recent years States passed individual laws aimed at religious schools, but these were not rigidly enforced. In 1916 it was officially stated that 80 per cent of the population in Mexico was illiterate. Determined efforts on the part of interested educators of note, chief among whom stood José Vasconcelos, resulted in reducing this high percentage by 1924 to about 65 per cent. Great strides were being made in Mexico toward a better and more general and accessible system of education, and the programme for the first half of 1924 called for the formal opening of the Benito Juarez Educational centre, in Mexico City, to accommodate 4000 children of both sexes, and equipped with library, swimming pool, etc. The Gabriela Mistral, in another section of Mexico City, was also to receive 4000 students, boys and girls, as well as some older students. A national stadium and a Hispano-American Flag Room and library were also to be opened, while on May 15, 1924, on the outskirts of Mexico City, the José Maria Morelos school was to begin functioning by receiving 5000 students. In May, 1924, it was planned to inaugurate the Technological Institute in Mexico City. In 1910, the National University in Mexico City was refounded, and in 1924 it possessed an enrollment of over 7000 students. A number of special schools were also maintained by the government; chief among them were schools of law and medicine, agriculture, engineering, mining, commerce, and fine arts. Over 150 libraries and 34 museums were established throughout the country in the larger cities. The National Library alone, in Mexico City, contained over 200,000 volumes.

#### HISTORY

From the accession of Gen. Victoriano Huerta as provisional president on Feb. 18, 1913, until the defeat and flight of Adolfo de la Huerta in 1924, Mexico passed through a series of revolutions, civil wars, and attempted revolutions, in all of which foreign economic interests, and especially the interests of the United States, were so significantly involved as to rival if not overshadow in importance the domestic agrarian, religious, and constitutional issues which were at stake. The Huerta government was from

the outset in ill favor with the Washington administration, partly because Huerta was considered to have been responsible for the killing of the deposed president, Madero, on Feb. 23, 1913; partly because President Wilson believed Huerta's rule to be an obnoxious "military despotism"; and partly, as the letters of Walter Hines Page disclose, because a strong suspicion prevailed at Washington that Huerta was merely the tool of Lord Cowdray, the British oil magnate. By refusing to recognize Huerta, President Wilson had made it almost impossible for the provisional government to borrow money. By lifting the embargo on arms, on Feb. 3, 1914, a step which played directly into Huerta's enemies' hands, for they controlled the North and alone could purchase munitions in the United States, the American government afforded valuable assistance to the rebels. It is doubtful whether the ensuing struggle between Huerta's Federalist forces and Carranza's Constitutionalists was plainly between despotism and democracy. The rebels were not exactly the whole-hearted defenders of peasant rights, for Carranza was himself one of the largest land-owners, while Huerta during his short term had already moved to alleviate agrarian distresses; the rebels made no secret of their enmity toward the Roman Catholic church and openly persecuted the clergy; the meddling of foreign interests whose great property rights made Mexico a peculiar concern was not to be overlooked; the ambitions of military leaders, the desire for plunder and power, were undoubtedly potent factors. In short, the conflict was due to a complexity of interacting causes. President Wilson's "watchful waiting" policy materially influenced the outcome. Huerta was soon beset by enemies. To the north he was pressed by Villa, Angeles, and Gonzalez; to the west by Buelna, Cabrera, and Obregon; to the south by Zapata and Alvarado. One after another of his ministers deserted him, Rojas, Lozano, Tamarez, and Moheno (May-July, 1914). The *coup de grâce* was struck when American suspicious aloofness turned into direct interference. The arrest of American marines bound on a peaceful errand at Tampico on April 9 was immediately apologized for, but Admiral Mayo's insistence that a salute be rendered to the flag, in which he was reluctantly supported by Wilson, and Huerta's refusal unless the Mexican flag be similarly saluted, were the factors leading to the break. On April 21 American marines landed at Vera Cruz for the purpose of seizing the custom house. But firing from the houses made it necessary to clear the streets and take over the terminals and cable and telegraph offices. In the fighting 18 marines were killed and 70 wounded. The storm of resentment was universal in Mexico. Carranza might have joined Huerta in defying the United States had it not been for the cooler counsels of Villa. Thus isolated, Huerta was compelled to accept the proffer of mediation tendered by the A. B. C. Powers, i.e. Argentina, Brazil, Chile. Mediators met at Niagara Falls on May 20, but no solution presented itself that was at once acceptable to the Huertistas, the Carranzistas, and the Americans. Carranza's generals, in a conference at Torreon in July, 1914, expressed themselves as unequivocally opposed to any treatment with Huerta short of unconditional surrender. The result was a decision to continue the fighting. This turn of

affairs hastened Huerta's fall; he resigned on July 15. His successor, Francisco Carbajal, remained in office less than a month. The Constitutionalists now hastened their advance. San Luis Potosí fell on July 17, Guaymas on July 18, Manzanillo on July 24, Guanajuato on July 28; Pachuca, Toluca and Morelia, August 9-10. On August 13 a protocol was signed arranging for the peaceful capitulation of Mexico City. On August 15, General Obregon rode into the capital at the head of 15,000 men. On August 20 Carranza made his triumphal entry.

Carranza's accession failed to inaugurate the peaceful reign of democracy. In September the bandit Zapata, erstwhile Constitutionalist, resumed his lawless activities on the refusal of Carranza to accept his agrarian reforms. Another revolt was the work of Gen. P. Orozco in the neighborhood of Aguascalientes. Late in August a counterrevolutionary movement was inaugurated near Puebla by 20,000 former Federal soldiers under the leadership of Generals Almazan, Aguilar, and Argumedo. Villa, however, was the most formidable enemy of the new government. On September 23 he declared war on Carranza, and with no decisive results hostilities dragged on. A convention of military delegates called by Carranza in October in Mexico City moved to Aguascalientes where it was dominated by Zapatistas and Villistas. On October 30, the convention decreed the retirement of both Carranza and Villa and on November 2 elected Gen. E. Gutierrez provisional president. Carranza refused to heed the decree of the convention, and, establishing himself at Puebla, prepared for trouble. On November 24 the Carranzista forces were withdrawn from Mexico City, leaving the capital a prey to the Zapatista bandits, who were at once joined by Villa. Meanwhile the Americans had evacuated Vera Cruz and possession was taken by Carranza. Amid the conflicts between the rival factions the state of the civilian population was anything but happy. From the provinces came reports of churches desecrated, of violence done to priests and nuns, of towns and estates plundered. The lot of the clergy was particularly unfortunate and elicited the commiseration of Pope Benedict XV on Oct. 25, 1914.

The history of the next two years is the story of the varying fortunes of Villa and Carranza, of Constitutionalists and "Conventionists." A third party, for a brief time, was injected into the squabble, when Gutierrez, who had been unseated on Jan. 17, 1915, gathered a force and established headquarters at Pachuca. On January 26, having been defeated in skirmishes about the city, Villa evacuated Mexico City and retreated northward. In February he encountered the forces of Gutierrez and Carranza in separate battles of San Luis Potosí and won decisive victories. On February 13 he captured Guadalajara, but early in March "Conventionists" retook Mexico City. Thence on, his star declined. In three disastrous attempts to capture Celaya from General Obregon, Villa lost in killed and wounded more than 20,000 men. In May he had to give up Monterey and suffer defeat at Paredon and Trinidad Station. In all these forays Mexico City was always the focal point. During 1915, Constitutionalists and Conventionists each held the city for three periods, to the infinite harm of the population, native and foreign. Levies were imposed on foreigners,

and shops were pillaged; rioting became a commonplace. By June the city was almost completely isolated, and the dearth of food presented a very real danger. This, and the continued protests of foreign nations against the destruction of lives and property, once more brought the United States on the scene. On June 2, President Wilson issued a declaration of policy which held out the promise of aid to any party capable of winning a decisive victory. This served as a spur to renewed activity. Mexico City was taken, lost, and taken again in the month of July by Constitutionalists under Gonzales. Meanwhile the United States had invited the ambassadors and ministers at Washington of Argentina, Brazil, Chile, Bolivia, Guatemala, and Uruguay to a conference for the consideration of Mexican affairs. The conference assembled in August, and in an appeal dated August 11 it called on the warring factions to get together for an amicable discussion of their differences and the best interest of their country. Villa consented; Carranza refused on the ground that he could not tolerate "that the interior affairs of the republic be handled by mediation or by the initiative of any foreign government." Regardless of this check, the conferees met once more in New York City on September 18 and decided that recognition would be accorded that group which could give evidence of possessing "material and moral capacity necessary to protect the lives and property of natives and foreigners." Three weeks later the conference accorded *de facto* recognition to Carranza. With the other nations, Colombia and Nicaragua joined a little later. Immediately after, 200 of Zapata's officers laid down their arms, and Gutierrez likewise surrendered. Villa alone remained. His next move was startling and could be interpreted only as the result of a desire to force American intervention. On Jan. 11, 1916, a band of Villistas stopped a train near Santa Ysabel, removed a party of 19 engineers on their way to open a group of mines, and in cold blood killed all but one.

Indignation in the United States reached fever heat. Resolutions were immediately introduced in Congress demanding intervention; the President's "watchful waiting" policy was strongly attacked. Only calmer counsels prevented the passage of the resolutions and the forcing of the President's hand. Information divulged by Secretary Lansing indicated how precarious was the position of Americans in Mexico and on the border. Figures showed that 76 Americans had been killed in the three years preceding Jan. 1, 1916. Of these, 24 had been killed from causes arising directly out of revolution; 44 by bandits, Indians, and civilians; and 8 in a railroad accident which was a result of the disorders. Between 1913 and 1915, 20 American civilians, 16 American soldiers, and 62 Mexicans were killed on the American side of the border. Two months later the events occurred which led the United States to intervene directly. On March 9, the border town of Columbus, N. M., was suddenly raided at night by some 1500 Villistas, and 11 civilians and 9 troopers were killed. With the almost unanimous consent of Congress, the President despatched a punitive expedition under General Pershing across the border in hot pursuit of Villa. Carranza's conduct throughout the preceding discussions had been extremely ungracious. Conditions laid down by

him, though onerous, were accepted; the pursuing forces were not to cross the line within six miles of any town on the border or to occupy any city or town; railroads could be used only in case trains were not guarded. From Casas Grandes three divisions of troops radiated in different directions. Near Guerrero a clash took place which resulted in the rout of Villa and his men. The most important conflict, during the chase, ironically enough, took place between Americans and official Mexican troops. On April 12, a detachment of cavalry, about to encamp outside the city of Parral, was suddenly attacked in the rear and both flanks and compelled to retire to a nearby village for shelter. Only the arrival of reinforcements at nightfall prevented the occurrence of what might well have been a tragedy. Villa, however, was not heard from, though the American occupation continued. In May, Generals Scott and Funston met with Generals Obregon and Trevino, but without result. On May 22, Carranza, in a long note in which he questioned the sincerity of American purposes, demanded the immediate withdrawal of the American troops. The American reply was the sending of all available regulars to the border and the calling out of the militia of Texas, Arizona, and New Mexico. On June 18 the entire organized militia and national guard of all the other states were called into the service. By July 31, 112,000 militia troops were transported to the border. Border raids continued from time to time, and small detachments occasionally crossed the boundary line in pursuit. On June 20, Secretary Lansing replied to Carranza and bluntly refused the withdrawal of the American troops. On the same day American troops were attacked at Carrizal by Mexicans and after a hot fight were compelled to retreat. The Americans killed and wounded numbered 16; the captured, 24. A few days later the prisoners were released. During the following month the American troops gradually withdrew northward. On July 4, in a note to the State Department, Carranza suggested mediation on the part of Latin-American countries as a way out of the difficulties. From Sept. 15, 1916, to Jan. 15, 1917, a commission assembled in the United States; but it was made up of only American and Mexican delegates. While the commissioners sat, civil war again broke out. In October and November, 1916, Villistas were active in the neighborhood of Chihuahua. During the prolonged sittings of the commission it became evident that the only real question under discussion was the right of the United States to send punitive expeditions into Mexico. On November 24 a protocol was signed by all the delegates which called for American withdrawal in 40 days, though the United States reserved the right to pursue bandits who had invaded American territory. It was not clear in 1917 just what had been accomplished. Mexico refused to accept the protocol; the problem of guarding the American border was left unsolved; and those larger questions of international relations which had been the peculiar concern of President Wilson were not touched on. On Feb. 5, 1917, the withdrawal of troops from Mexico was complete, and the militia on the frontier was rapidly being reduced about the same time that Henry P. Fletcher, American ambassador, left for Mexico.

On Oct. 22, 1916, delegates had been elected

to a Constitutional Assembly. This body, representing only adherents of a *de facto* government, met at Sueretaro on December 1, and by Jan. 31, 1917, it had completed a new fundamental law. The document contained many advanced provisions; the presidency could be held for only a single term; suffrage was to be universal without distinction of sex; a radical labor code provided for an eight-hour day, the minimum wage, compulsory profit sharing, and a free employment bureau; the religious orders were expropriated, their churches, schools and hospitals confiscated, and the schools secularized. The most famous provision, Article 27, restored communal lands to Indian villages; authorized each state or territory to fix the maximum area which any person might own and to subdivide excess holdings; deprived religious organizations of the right to own land; and, probably most important of all, declared ownership of all minerals and petroleum resources to be vested "in the nation." Only Mexicans by birth or naturalization were to have the right to acquire ownership of lands or to obtain mineral and oil concessions; foreigners could receive such rights only by agreeing to renounce their rights of appeal to their home governments. On Mar. 11, 1917, Carranza was elected president. Most of the events of the next three years hinged on Article 27. It had been incorporated in the constitution against Carranza's wishes and as a result of the agitation of the more radical followers of Obregon. Immediately on its promulgation, state after state formed agrarian commissions which proceeded to confiscate and redistribute the land in the interest of the Indian peons. Carranza, in order to check these local commissions, found it necessary to appoint a National Agrarian Commission for the administration of the matter on a more scientific basis. It thus became evident that something like an agrarian revolution had been started. International complications soon arose to thwart this attempt at putting the Mexican house in order. The nationalization of the subsoil struck at the foreign ownership of the very rich oil fields in Mexico. On Feb. 19, 1918, the Mexican government proceeded to inaugurate this policy by imposing area taxes and ground taxes on foreign concessions. Other decrees of a similar purport followed during the year. Protest, of course, was inevitable, and, as events proved, unavailing. On April 2, Mr. Fletcher, on behalf of the American government, filed a note declaring that "the seizure of property at the will of the sovereign without legal process equitably administered and without provision for just compensation has always been regarded as a denial of justice and a cause for diplomatic representation." The refusal of foreign operators to conform with the governmental decree was followed by a refusal to issue drill permits. The lower Mexican courts upheld the government; not until much later was the air cleared. Appeal taken to the Supreme Court finally brought in 1922 the decision that while under Article 27 the right of ownership by the state to all subsoil resources could not be questioned, nevertheless all individuals and companies who had purchased properties for the express purpose of exploiting their mineral and oil deposits were to be protected in their private rights. The retroactive character of the article was therefore disclaimed. On this basis, drilling

permits were once more issued in 1922, and partial operations were inaugurated after a four-year cessation of activities.

The ensuing years of Carranza's administration could hardly be characterized as fulfilling the high democratic hopes entertained for the Constitutionalist movement. Peace, of course, Mexico never enjoyed. Banditry continued to operate in defiance of the Mexican soldiery, though possibly with their connivance, too. In reprisal for Mexican outrages, American border troops often found it necessary to cross the frontier in pursuit of raiders. During 1919 alone, more than 300 serious outbreaks were reported to the Senate Committee on Foreign Relations. A particularly flagrant act was the capture and holding for ransom of William Jenkins, a United States consular agent, on October 19. Despite the strong protests of the State Department, the Mexican government refused to release Jenkins on the ground that he was implicated in his own abduction. On December 4, however, he was suddenly set free. While commerce increased under Carranza and taxes were being collected more widely than before, anarchy in government was conspicuous. Official corruption flourished; dissension among the leaders added to the prevailing unrest; the constitution, with its radical pretensions, was flagrantly disregarded. How unstable affairs were, the events of 1920 indicated. As the presidential election campaign progressed through 1919 and 1920 it became evident that Obregon, with the support of the army, the radicals, and the foreign interests, was going to win over Carranza's nominee. Carranza's action was typical. Obregon was summoned to Mexico City under arrest. Meanwhile the state of Sonora had broken out into open revolt because of Carranza's attempt to control it. By the end of April the West and North were under arms. In the interim Obregon had made his way safely from Mexico City to the insurgents' camp and was in the field. On April 23, the revolutionists proclaimed a new provisional government with Adolfo de la Huerta as president. On May 7, after the city of Vera Cruz had capitulated to the insurgents, Carranza fled from the capital and made for the seacoast, ostensibly to escape the country. His flight was impeded at almost every step. On May 21, after having surrendered himself to the troops of General Herrera, he was treacherously shot and killed while asleep in a hut near the village of Tlaxcalantongo in Puebla.

On May 24, 1920, the Mexican Congress chose Adolfo de la Huerta as provisional president; in the September election Obregon was victorious, meeting with only a nominal opposition. He was inaugurated on Dec. 1. Obregon's administration was marked by steady progress. His sympathies with labor and the agrarian elements were indicated in legislation designed to further their prosperity, through the enforcement of the labor code and the agrarian articles of the constitution. The restoration of lands formerly held by villages and tribes, which had been expropriated by individuals, steadily proceeded, and so did the partitioning of the great estates. During the first half of 1923 alone, over 600,000 acres were restored and 1,500,000 acres turned over to peasants by the Mexican Agrarian Commission. Federal lands, including water rights, were thrown open to homesteaders. No attempt was made to inter-

fere with the Socialist régime of Governor Corrallo in Yucatan. From 1921, the rehabilitation of the railways made a continuous advance; even building was undertaken on a large scale. The army was reduced to 50,000 men, and the pay of the official bureaucracy was cut. A consistently friendly attitude was displayed toward foreign nations and their nationals. On July 13, 1921, President Obregon invited all interested countries to send representatives to constitute a permanent Mexican claims commission; in November, France, Great Britain, Italy, Spain, and the Netherlands accepted. Steps were taken to clear up the tangle of the national debt. In September, 1921, Thomas W. Lamont of J. P. Morgan and Company arrived in Mexico for the purpose of effecting arrangements for the funding of the bonds held by Americans, British, French, Dutch, and Belgians. The accrued interest on Mexican external bonds now amounted to some \$200,000,000. In September, 1922, an agreement was reached with the international bankers by which the Mexican government pledged itself to set aside annually for the service of the debt the entire proceeds of the oil export tax, 10 per cent of the gross revenues of the national railways, and all the net operating revenues of these railways. Late in 1922 the first interest payment on the bonded indebtedness was deposited in New York. Nothing exhibited better the honest purposes of the administration than the attitude adopted toward Article 27. In spite of an active interventionist propaganda carried on in the United States by oil interests, to which Senators King and Fall lent their influence, Obregon refused to be turned from his course. He declined to formulate a treaty with the United States, based on the recognition of American property rights, before his own government was recognized. In 1922 he signed a decree declaring that Article 27, in accordance with the decision of the Mexican Supreme Court, was not retroactive; but further concessions he would not make. The responsibility for nonrecognition now shifted to the United States, for Mexico had met all foreign demands relative to the external debt, the outstanding claims, and the retroactive character of the offensive constitutional article. The United States delayed until the spring of 1923, when two American commissioners were despatched to Mexico City to treat with the government. During the course of the ensuing negotiations, the Mexican government evinced a conciliatory disposition by enacting a new petroleum law on April 26; it confirmed the validity of concessions obtained before May 1, 1917, but required concessionnaires to revalidate their claims within three years. Likewise, Obregon endeavored to facilitate a settlement of the land problem by increasing the size of estates permitted to individual owners and by granting immunity from expropriation to large irrigation companies having colonization contracts with the federal government. A provision for indemnification, in public bonds, of landowners who had suffered from confiscatory measures between 1913 and 1917, failed to satisfy the American commissioners, who demanded payment in money. Not until August 15 was a final agreement reached. In regard to oil and minerals, the subsoil rights acquired and exploited by American companies before May 1, 1917, were validated, but the provisions of the constitution were to be applied after that date.

The same understanding was applied to agrarian lands so that all titles acquired after 1917 were subject to the agrarian reform laws. To this agreement were appended conventions calling for the creation of two mixed claims commissions, one for the settlement of American claims arising from disorders of the revolutionary period, the other to deal with all other claims of nationals of either country against the other. In accordance with this agreement, the United States formally recognized the Obregon government on Aug. 31, 1923. France quickly followed suit, but the British foreign office continued to withhold recognition, perhaps because of uncertainty regarding the security of British oil interests. On its part, the Mexican government carried out the agreement in regard to oil rights by a decree dated Nov. 10, 1923; subsoil rights acquired and exercised, or about to be exercised, prior to the promulgation of the constitution in 1917, were respected, but henceforth in all titles to land included in the national domain, the nation's ownership of subsoil resources was to be expressly reserved. The land agreement did not prevent energetic continuation of Obregon's programme of land reforms. On the contrary, almost 300,000 hectares were distributed between August 4 and November 20, under a decree permitting landless citizens to claim homesteads on public land.

The agreement with the United States was undoubtedly the outstanding event of the year 1923, but notable also were the adoption of a budget allotting \$15,000,000 for payment on the international debt account, the assassination of the once prominent revolutionary leader Francisco Villa on July 20, the expulsion of the papal representative, Mgr. Filippi, and the beginning of a momentous electoral campaign. The two last-mentioned occurrences require further notice. Mgr. Filippi incurred the displeasure of the government by participating in an open-air religious ceremony to celebrate the laying of the cornerstone of a shrine in defiance of the orders of the governor of the state (Guanajuato). The Federal government promptly supported the governor in his prohibition of Catholic ceremonies out-of-doors, and Mgr. Filippi was compelled to leave Mexico at once. This episode evoked protests not only from the Vatican but from numerous Catholic organizations in Mexico itself and in other countries, but it was only one of numerous anti-clerical measures. The law passed by the Durango state legislature later in the same year, limiting to 25 the number of clergy for each religious denomination in the state, which at that time had over 200 priests, was a typical manifestation of the anti-Catholic feeling prevalent among many of the local politicians. Such interferences with religious liberty alienated many of Obregon's supporters and were in some measure responsible for the organization of a counter-movement, modeled on the plan of the Italian Fascisti (q.v.), to defend, among other things, the interests of the Catholic Church.

The presidential campaign, in anticipation of the elections scheduled for July 6, 1924, was begun quite early in 1923 and soon overshadowed all other interests. President Obregon himself was debarred from becoming a candidate for reelection under the terms of the constitution of 1917, but two members of his cabinet appeared as candidates for nomination by the government

party, the Cooperatistas. General Plutarco Calles, resigning his post as minister of the interior, appeared first in the field, in September, and anticipated an easy victory as President Obregon's personal choice. But a majority of the Cooperatista party, it developed, preferred the finance minister, Adolfo de la Huerta, who had played a conspicuous rôle in the recent negotiations with the United States. After seemingly hesitation, de la Huerta yielded to the promptings of his friends, resigned from the ministry, and in October entered the lists against Calles. President Obregon now hastened to support his protégé Calles. Through a new finance minister, Alberto Pani, Obregon accused de la Huerta of gross extravagance and responsibility for Mexico's virtually bankrupt condition. Nevertheless, the Cooperatista party, assembling in convention at Mexico City, defiantly nominated de la Huerta as its candidate, and the latter promised to stand on the Cooperatista platform of promoting coöperative enterprises, indemnification of landowners for estates divided among the peasants, and protection of municipal home rule. The Social Reform party, the National Independent party, and several other organizations likewise rallied to de la Huerta's standard, in support of what might be called liberal conservatism, i.e. agrarian reform of a moderate type. General Calles, on the other hand, was nominated by the National Agrarian party, and pledged himself not only to maintain the constitution but also to carry out the agrarian reform in a thoroughgoing fashion and to champion the interests of the workingmen. A minor candidate was General Flores, nominated by the Reformed Revolutionary party. Meanwhile excitement had been raised to an extraordinary height by various provincial elections, important because each faction was eager to control the local governmental machinery and thus to secure victory in the coming national contest. In several of these local contests blood was shed. Claiming that the Federal administration was interfering in the state elections and violating state sovereignty, the de la Huerta faction resorted to desperate measures. On Dec. 5, 1923, they issued the Plan de Vera Cruz, a plan for a new insurrection, and at once the military forces in the states of Vera Cruz, Chihuahua, Michoacan, Tamaulipas, and San Luis Potosí accepted the call to rebellion. Once more the country fell a prey to civil war, with all its accompaniments of banditry, confiscation, and "executions." The rebels soon gained other states, Yucatan, Oaxaca, Guerrero, Guanajuato, Jalisco, Colima. Their armies moved against the capital. In the provinces the movement clearly revealed its conservative character; its energy was directed hardly less against "reds" and labor unions than against the Obregon government. Ostensibly, however, the aims of the rebels were declared by de la Huerta to be the respect of life and property, legislation regarding the rights of labor and capital, indemnification for expropriated landowners, respect of elections, abolition of the death penalty, woman suffrage, and educational reform. Other reasons for the rebellion were later divulged, or alleged, by President Obregon. Officials of the Aguila Oil Company, it was charged, had aided the de la Huerta forces, although on the other hand Doheny, American oil operator, admitted lending the Obregon government \$5,000,000 to suppress the rising; there

was some ground for suspecting, therefore, that this new civil war, like some of its predecessors, was at least tainted with oil. Yet another cause of the break between Obregon and his former lieutenant was disclosed by the president; during the Lamont negotiations of 1922 de la Huerta had obtained Obregon's consent to an otherwise unacceptable debt settlement by telegraphing to him the news, subsequently revealed to be untrue, that Lamont had guaranteed the basis of a new bank to aid in the financial reconstruction of Mexico. Without this bank, the debt settlement had proved unduly burdensome. In the light of this charge, it is almost paradoxical that the United States Government should have favored Obregon against de la Huerta; yet such was the case. The United States Government sold arms to Obregon, refused arms to the rebels, and threatened a naval demonstration against the latter in January, 1924. Thanks in part to the benevolence of Washington and also to the loyalty of large elements in the Mexican population, notably of organized labor, Obregon emerged victorious. Although several notable successes were achieved by the Huertista forces under their able commander, General Estrada, in December, 1923, the tide soon turned. The Federal forces recaptured the important railway centre of Puebla on Dec. 22 and began to press back the lines which had been closing in on the capital. Throughout January, 1924, the opposing armies were deadlocked. Early in February Obregon's troops took the seaports of Vera Cruz and Tuxpam; soon afterward Guadalajara fell; the states of Michoacan, Guanajuato, Jalisco, and Colima were reclaimed; several of the insurgent armies were dispersed, and their commanders captured or put to flight. By the end of March the rebels had lost all except portions of Yucatan, Campeche, Tabasco, and Chiapas, and the outcome had become sufficiently clear to warrant Charles B. Warren in presenting his credentials on March 31 as ambassador from the United States. In April, Yucatan and Chiapas were cleared of rebels. De la Huerta himself fled from Mexico. Rounding up the remnants of the once imposing Huertista army was a slow process, but it had been virtually completed by the date set for the presidential elections, July 6.

With de la Huerta eliminated, General Calles was able to enter the elections without formidable opposition. Calles himself had suspended his political campaign to serve in Obregon's army against the insurgents and resumed his candidacy only in the last week of March, after the danger had been averted. More distinctly than ever he was now stamped as the approved candidate of the Obregon government; and more than ever, in view of the Huertistas' attacks on labor radicalism, he was supported by the working classes as well as by peons hungry for land and by middle-class liberals. He openly endorsed the radical land-reform policy of Emiliano Zapata, thus winning favor with the peasantry. He voiced a wish that wages in Mexico might be as high as in the United States, a wish that was not less effective politically because it was utopian. Yet he took pains to dissociate himself from Bolshevism or "red" Socialism. His opponent, General Flores, stood on a platform of "progress, order, and honesty," and was generally supposed to enjoy the support of conservative business and landed interests, the moderate wing of the working class,

the moderates, and Catholics of clerical tendency. The election was held on July 6 in what for Mexico may be considered an exceptionally peaceful manner. Official returns came in so slowly that the definitive announcement of the result was not expected before autumn; Calles, however, was generally believed to have been the victor.

One unfortunate aftermath of the Huerta rebellion was the failure of the Mexican Government to meet the payments due on June 30 under the Lamont-de la Huerta agreement. Not only had the civil war made heavy drains on the treasury, but, President Obregon explained, he had been unable to obtain a foreign loan; moreover, the obligations incurred by the agreement were accepted on the basis of de la Huerta's false statement that he had obtained the promise of a loan for irrigation works and for the establishment of a central bank of issue. Failing this loan, it had been impossible, even by the most drastic economies and sacrifices, to fulfill the bargain of 1922.

**MEXICO.** CULTURE OF. See ETHNOGRAPHY.

**MEYER, ADOLF** (1866- ). A Swiss neurologist, born near Zurich. He studied at many universities in Europe and in 1892 came to the United States, where he was on the staff of the University of Chicago and of several hospitals. From 1902 to 1910 he was director of the Pathological Institute for the New York State Hospitals and from 1910 professor of psychiatry and director of the Henry Phipps Psychiatric Clinic at Johns Hopkins Hospital. He was a member of many medical and scientific societies and wrote much on neurology, pathology, and psychiatry.

**MEYER, EDUARD** (1855- ). A German historian (see VOL. XV). He discarded his English and American degrees in 1919. Among his works are *Die Aufgaben der Höheren Schule und die Gestaltung des Geschichtsunterrichts* (1918); *Cæsars Monarchie und das Prinzipat des Pompeius* (1919); *Preussen und Athen* (1919); and *Ursprung und Anfang des Christentums* (1920-22).

**MEYER, HERMAN HENRY BERNARD** (1864- ). An American bibliographer, born in New York City. He studied at Columbia University and at Pratt Institute Library School and was for several years engaged in the profession of engineering. From 1905 he was chief of the periodical division of the Library of Congress and was also chief of the order division and chief bibliographer there. He wrote many books, including *Inland Waterways of Europe* (1910); *Employer's Liability and Workman's Compensation* (1911); *Capital Punishment* (1912); *Europe and International Policies* (1914); *Divorce* (1915); *Monroe Doctrine* (1919); *Scientific Management* (1920); *Treaty-making Power* (1920), and *Income Tax* (1921).

**MEYERHOFF, OTTO.** See HILL, ARCHIBALD V.

**MIAMI CONSERVANCY FLOOD PROTECTION.** See FLOODS AND FLOOD PROTECTION.

**MIAMI UNIVERSITY.** A coeducational institution at Oxford, Ohio, founded in 1809. The student enrollment increased from 651 in 1914-15 to 1556 in 1923-24, the faculty membership from 51 to 102, and the number of volumes in the library from 47,000 to 71,500. An addition was built to the library at a cost of \$142,000; the university hospital, the indus-

trial arts building and Wells Hall, a dormitory for girls, were completed; and work was under way on Ogden Hall, a new men's dormitory, a freshman dormitory, the McGuffey addition, and a new recitation building, in 1924. A tract of 93 acres was added to the campus. President, Raymond M. Hughes.

**MICHAELIS, SOPHUS** (1864- ). A Danish author (see VOL. XV). His later publications include: *Hellener og Barbaren*, a story of the Persian wars (1914); *Digte*, poems (1919); *Dommeren, a novel* (1921); *Himmelskibet* (1921); and *Manden fra Elba* (1921).

**MICHELSON, A. A.** See PHYSICS.

**MICHIGAN.** Michigan is the twenty-second State in size (57,980 square miles), and the seventh in population; capital, Lansing. The population increased from 2,810,173 in 1910 to 3,668,412 in 1920, a gain of 30.5 per cent. The white population rose from 2,785,247 to 3,601,627; negro, from 17,115 to 66,082; native white, from 2,189,723 to 2,874,992; and foreign-born white, from 595,524 to 726,635. The urban population of the State increased from 1,327,044 to 2,241,560; the rural decreased from 1,483,129 to 1,426,852. The growth of the principal cities was as follows: Detroit (q.v.), 1910, 465,766; 1920, 993,678; Grand Rapids (q.v.), 112,571 to 137,634; Flint (q.v.), 38,550 to 91,599; Saginaw, 50,510 to 61,903; Lansing, 31,229 to 57,327. The phenomenal growth of Detroit during the decade was due to its extraordinary industrial development, chiefly in the manufacture of automobiles and their accessories.

**Agriculture.** Michigan is one of the important agricultural States. Conditions during the decade 1910-20 reflected the fluctuations of production and value in the period during and following the War. This general situation is discussed in the article AGRICULTURE and in separate articles on the chief agricultural products. While the population of the State increased 30.5 per cent in the decade 1910-20, the percentage of the population living in rural territory declined from 60.7 in 1900 to 52.8 in 1910 and 38.9 in 1920. The number of farms decreased 5.1 per cent (from 206,960 in 1910 to 196,447 in 1920). The area of land in farms, however, showed a slight increase, from 18,940,614 acres in 1910 to 19,032,961 acres, or 0.5 per cent; and the improved land in farms from 12,832,078 to 12,925,521 acres, or 0.7 per cent. The total value of farm property showed an apparent increase, from \$1,088,858,379 to \$1,763,334,778, or 61.9 per cent; the average value per farm from \$5261 to \$8976. The prices of farm land increased materially, stimulated by war prices for farm products. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of land used for agricultural purposes in 1910 was 51.5 per cent; in 1920, 51.7 per cent. The percentage of improved land in farms increased from 34.9 to 35.1. Of the total of 196,447 farms in 1920, 159,406 were operated by owners, 2319 by managers, and 34,722 by tenants. The corresponding figures for 1910 were 172,310, 1961, and 32,689. White farmers in 1920 numbered 195,714,

compared with 206,014 in 1910; colored, 733, compared with 946. Farms free from mortgage in 1920 numbered 72,869, compared with 88,705 in 1910; those under mortgage, 78,758, compared with 82,631. The total number of cattle in 1920 was 1,586,042, compared with 1,497,823 in 1910. Dairy cattle, 1,256,141, compared with 767,083; sheep, 1,209,191, compared with 2,306,476; hogs, 1,106,066, compared with 1,245,833. The estimated production of the principal farm crops in 1923 was as follows: corn, 60,190,000 bushels; spring wheat, 125,000; winter wheat, 16,456,000; oats, 48,508,000; rye, 6,538,000; barley, 3,466,000; potatoes, 30,013,000; hay, 3,320,000 tons; and sugar beets, 897,000 short tons. Comparative figures for 1913 are: corn, 56,112,000 bushels; wheat, 12,776,000; oats, 45,000,000; rye, 5,362,000; barley, 2,108,000; potatoes, 33,600,000; and hay, 2,520,000 tons.

**Mining.** Michigan is an important producer of two minerals, iron ore and copper, the relative production of which, in the decade 1914-24 is indicated by the following figures. For iron ore, the production in 1914 was 10,796,200 long tons; 1915, 12,514,516; 1916, 18,071,016; 1917, 17,868,601; 1918, 16,899,341; 1919, 15,438,930; 1920, 17,510,742; and 1921, 7,283,492; while in 1922 there was shipped from the mines 12,457,856 long tons. Of copper there was produced in 1914 164,344,058 pounds; in 1915, 265,283,378; 1916, 273,692,525; 1917, 255,710,128; 1918, 226,794,139; 1919, 178,826,486; 1920, 154,695,073; 1921, 86,370,028, and 1922, 121,712,365. The decrease in output of both iron and copper ores in the last two years of the period was due chiefly to the general business depression whose results were shown in diminished use of iron and copper. In addition to these two minerals, there are also produced considerable quantities of manganese ore, salt, sand and gravel, and stone. The total value of the mineral products of the State in 1921 was \$69,551,198, compared with \$166,338,818 in 1920; \$122,973,774 in 1919; \$158,312,121 in 1918; and \$57,743,555 in 1914.

**Manufactures.** Michigan is one of the most important manufacturing States. It ranks first in the automobile industry, which acquired great importance in Detroit and other cities. There were, in 1920, 28 cities of more than 10,000 inhabitants, forming 51.6 per cent of the total population of the State; and these, in 1919 reported 81.8 per cent of the total value of the State's products. In 1909 there were in the State 9159 manufacturing establishments; in 1914, 8724; and in 1919, 8305. Persons engaged in manufacture numbered 271,071, 320,611, and 549,069; and capital invested amounted to \$583,946,965, \$869,143,114, and \$2,340,954,312, in those years. The value of the products in 1909 amounted to \$685,109,169; 1914, \$1,086,162,432; and 1919, \$3,466,188,483. The extraordinary increase in value of products, 1914-19, was, however, due largely to the change in industrial conditions brought about by the War, and cannot properly be used to measure the growth of manufactures during the census period, 1914-19; but the increase in number of persons engaged in manufacture clearly indicates a decided growth in the manufactures of the State. The most important industry in point of value of product is the manufacture of automobiles, the output of which, in 1909, was valued at \$96,651,000; in 1914, \$398,289,-

000; and in 1919, \$1,620,383,000. Foundry and machine shop products, ranking second in this respect, were valued in 1909 at \$45,399,000; in 1914, \$64,576,000; and in 1919, \$324,354,000. The manufacture of steam, gas, and water engines, which developed chiefly after 1914, is third in importance, with a product valued in 1919 at \$101,989,440. Shipbuilding, in fourth place, had a product valued in 1909 at \$5,034,000; in 1914, \$2,823,000; and in 1919, \$85,155,000. The chief manufacturing city of the State is Detroit, having 2036 manufacturing establishments in 1909, with a product valued at \$252,939,000; in 1914, 2036 with \$400,348,000; and in 1919, 2176 with \$1,234,520,000. Detroit is the chief city in the country in the manufacture of automobiles and parts. Grand Rapids, the city of great furniture manufacturing establishments, in 1909 had 524 manufacturing establishments, with a product valued at \$42,231,000; in 1914, 594 with \$49,792,000; and in 1919, 611 with \$109,135,000. Other important manufacturing cities are Flint, Lansing, and Saginaw.

**Education.** Educational progress in Michigan during the decade 1914-24 was steady and marked. In relation to the other States of the Union, according to the reports of the Russell Sage Foundation, Michigan rose from nineteenth place in 1910 to tenth in 1918. Only nine States made a more rapid growth in the period 1890-1918. During the decade much important legislation was enacted, including laws providing for a minimum term of nine months, for one year of professional work above a four-year high school course for teachers, and State supervision of private, parochial, and denominational schools; a consolidated school law under which 43 rural high schools had been organized at the end of 1923; a tuition law which furnished high school advantages to the students of inaccessible communities; and State aid measures for partially impoverished districts and for classes for various types of handicapped children. The decade was also notable for the growth of the normal schools and teachers' colleges and for the vastly increased attendance, together with much new building, in the normal schools, the University, and the land grant college. The school population of the State increased from 815,849 in 1913 to 1,038,897 in 1922; and the enrollment in the public schools from 595,725 to 752,525. The total amount spent for education in 1922 was \$54,059,857. The percentage of illiteracy in Michigan decreased from 4.2 in 1910 to 3.9 in 1920. Among the native white population it decreased from 1.3 to 0.8 per cent; and among the negro, from 6.9 to 4.9. Among the foreign-born there was an increase of from 9.6 to 10.5.

**Finance.** For finances, see STATE FINANCES.

**Political and Other Events.** The decade 1914-24 contained an abundance of political happenings. It saw the rise of Henry Ford as a political figure in the State and nation. Elections were held in 1914 for governor and other State officers and for a Congressman. The Democrats reelected Woodbridge N. Ferris as governor, but the remainder of the State ticket elected was Republican. The Republicans also carried the Legislature. A "blue sky" law passed by the Legislature of 1913 was declared invalid in 1914 by the Federal Court of the eastern district of Michigan. The 1915 Legislature reenacted the law in valid form.

At the presidential preference primary election in April, 1916, Henry Ford received a plurality of the Republican votes, and the State delegation, in obedience to his mandate, voted for him on the first ballot at the national convention, but later swung to Charles E. Hughes. In the State elections of this year, Albert E. Sleeper, Republican candidate, was elected governor, with the rest of the State ticket; Charles E. Townsend, Republican, was reelected United States Senator. In the presidential voting, Charles E. Hughes received 339,097 votes; President Wilson, 286,775. At this election a constitutional amendment providing for State-wide prohibition was adopted; it became operative on May 1, 1918. At the State elections held in April, 1917, all candidates on the Republican State ticket were elected. On Dec. 22, 1917, four Germans were convicted of activities against the United States. These included attempts to destroy the Welland Canal and several bridges. Elections were held in 1918 for United States Senator and for governor and other State officers. As candidates for the Senate, Truman H. Newberry, Republican, and Henry Ford, Democrat, were nominated; Newberry was elected by a plurality of 7567. Shortly after the election, charges of having expended money in the primaries in excess of the limit fixed by Federal law were made against him, and an investigation was undertaken by a Federal grand jury in New York. It was held that the investigation should be by a Federal grand jury in Michigan. A protest was filed with the Senate Committee on Elections against Newberry's right to a seat, but it was not sustained. Albert E. Sleeper, Republican, was reelected governor, and the Republicans elected all the members of the Legislature except two. At the State elections in April, 1919, women for the first time exercised full suffrage rights in Michigan. The woman suffrage constitutional amendment was ratified at the general election in November, 1918, after rejection in 1912 and again in 1913. A proposed amendment to the liquor law, permitting the sale of light wines and beers, was defeated at this election. In October, 1919, the Federal Department of Justice began grand jury proceedings in the western Michigan Federal court district to investigate charges of excessive expenditures by Truman H. Newberry in his election to the Senate. This body, on Nov. 29, 1919, returned indictments against 135 persons on the charge of violating the Federal laws. Those indicted included Senator Newberry, his brother, John S. Newberry, and many others prominent professionally, industrially, and politically. Senator Newberry and 15 others were found guilty. An appeal was taken to the United States Supreme Court, and the convictions were reversed on the ground that the act under which they were convicted was invalid in that it applied to elections and not to primary nominations. At the State election in April, 1919, an amendment was ratified authorizing the issue of \$50,000,000 for State highway improvements. At this election the entire Republican State ticket was elected.

At the general election in 1920, the Republicans made a clean sweep, and by the largest majority in the history of the State, Alexander J. Groesbeck was elected governor. The Republicans carried all 13 Congressional districts and elected every member of both houses of the

Legislature. In the presidential contest of this year, W. G. Harding received 762,865 votes; J. M. Cox, 233,460. A proposed amendment to abolish parochial schools was defeated. Elections were held in 1922 for State officers and for United States Senator and representatives in Congress. Charles E. Townsend, a candidate for reelection, was nominated in the primaries. The Democrats nominated Woodbridge N. Ferris, who had been governor of the State from 1913 to 1917. The chief issue in the election was the Newberry case. Senator Townsend had defended Senator Newberry in addresses during the Senate investigation and the campaign. Mr. Ferris was elected. He was the first Democrat to be elected to the United States Senate for Michigan in 70 years. The Republicans, however, reelected Governor Groesbeck and the rest of the State ticket, carried 12 of the 13 Congressional districts, and elected all but five of the 132 members of the Legislature. Several months before the general election of 1922 the Supreme Court decision reversing the conviction of Senator Newberry and his political associates in the campaign of 1918 was handed down. About the same time, after a Senate committee investigation, a resolution to unseat him was rejected by the Senate. However, directly following the election of this year, when the Newberry case was the chief issue in the Senatorial campaign, Newberry resigned as Senator, and Governor Groesbeck appointed James Couzens, mayor of Detroit, to succeed him. In the State election held in April, 1923, the Republicans elected their entire State ticket. In the presidential primaries held in April, 1924, President Coolidge received a large majority of the Republican votes. In a contest for the Democratic presidential nomination, Henry Ford defeated Senator Ferris. Ford was entered in the Democratic primaries without his consent, after having given notice that he would support President Coolidge. The State delegation to the national convention in New York therefore disregarded the plurality for him in the primaries and presented Senator Ferris to the convention as Michigan's choice for the presidential nomination.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. A war loan of \$5,000,000 was authorized for carrying on recruiting service and for caring for the dependents of enlisted men. The Legislature of 1919 authorized the creation of a State police force. It also created an Industrial Relations Commission with the duty of investigating general industrial conditions and created a State public utilities commission. Statutes defining and punishing criminal syndicalism and sabotage were passed. On Jan. 2, 1919, the Legislature ratified the Federal prohibition amendment and on January 10 the Federal woman suffrage amendment. In 1921 the Legislature approved a constitutional amendment authorizing a bond issue of \$30,000,000 for the soldiers' bonus. This amendment was ratified in the election in April of the same year. Bills were passed consolidating and centralizing State governmental authority. As a result, 33 departments, commissions, and bureaus were condensed into five departments, and a State administration board was created, consisting of the governor, secretary of state, treasurer, auditor-general, attorney-general, superintendent of public instruction, and high-

way commissioner. A special session in this year was held to put into effect the soldiers' bonus. A second special session was held as a result of a deficiency in the State appropriations. The Legislature of 1923 passed a measure punishing bribery of public employees; enacted a measure making it unlawful to publish or to accept wagers on races, games, or uncertain events; passed a uniform flag law; made the sale of narcotics a felony; amended the child labor laws, and gave to the State Prison Commission the management of industrial plans for prisoners. A special session of the Legislature was held in September, 1923, to rearrange the State Senatorial districts and to reapportion the Congressional districts, as the constitution directs must be done every 10 years; but a deadlock prevented the passage of a redistricting bill. In 1923 Governor Groesbeck inaugurated a system for building State concrete roads on State account with prison labor. In 1924 about 800 State prisoners so employed were paid \$1.25 a day and their keep.

**MICHIGAN, UNIVERSITY OF.** A coeducational State institution at Ann Arbor, Mich., founded in 1837. The enrollment of the university increased from 6258 in 1913-14 to 11,762 (estimated) in 1923-24. The faculty was increased in the same period from 535 to 848 members, the library from 350,000 to 546,000 volumes, and that portion of the income derived from the mill tax levied by the State was increased from \$1,029,060 to \$3,000,000. Many new buildings were erected during the decade. Two women's dormitories were built in 1915 and a third was completed in 1920. The natural science building was constructed in 1915, the general library in 1918, a laundry building in 1917, the Michigan Union in 1918, and the storeshed in 1916. In 1922 the storehouse and the storeshed were doubled in size by a new addition. The new university hospital building was begun in 1919, and it was expected that it would be completed by 1925. During the year 1923 the new engineering shops and laboratories, the Teachers' Training School, the William L. Clements Library of American History building (the gift, with the library collection itself, of Regent Clements), and the first unit of the new physical science building were completed. An addition to the Dental College in 1922 doubled its accommodations for students. The first unit of the literary building, the first unit of the new medical building, and the first unit of a large group of new buildings for the Law School were begun in 1923. From July 1, 1917, to June 30, 1925, the special appropriations from the State for new buildings, lands, and equipment amounted to \$9,950,000. Senator James Couzens gave \$600,000 for a new nurses' home, and an anonymous donor gave a new group of law buildings. Another anonymous donor gave \$150,000 for a research expedition to the Near East. The dental course was lengthened to four years in 1918. The Honorary Fellowship in Creative Art was held in 1921-23 by the American poet, Robert Frost, and in 1923-24 by Dr. Robert Bridges, the poet laureate of England. Marion LeRoy Burton, Ph.D., LL.D., succeeded Harry Burns Hutchins as president in 1920.

**MIDDLEBURY COLLEGE.** A coeducational, nonsectarian institution at Middlebury, Vt., founded in 1800. The college grew rapidly in

size during the decade 1914-24, with an enrollment for the earlier year of 340 students and for the later, 538. The faculty increased correspondingly from 31 to 50 members; the library, from 45,000 to 50,000 volumes. The productive funds were increased from \$600,000 to \$2,182,732. In 1915 the Mead Memorial Chapel was given to the college by John A. Mead. Paul Dwight Moody, D.D., succeeded John Martin Thomas, D.D., LL.D., as president in 1921.

**MIKKELSEN, EJNAR** (1880- ). A Danish explorer (see VOL. XV). Among his publications are *Tre Aar par Gronlands Ostkyst* (1914); *Norden Far Loo og Ret*, a story (1920); translated as *Frozen Justice* (1922); and *John Dale*, a novel (1921).

**MILHAUD, DARIUS** (1892- ). A French composer, born at Aix-en-Provence. After graduation from the Paris Conservatoire he settled in Paris as composer and lecturer. One of the most rabid of the futurists, he believes that the works of Beethoven and Wagner ought not to appear on any modern programme. In 1923 he visited the United States, conducting some of his works and lecturing at several universities. He wrote an opera, *La Brébis Egarée* (Paris, 1923); a ballet, *L'Homme et Son Désir* (Paris, 1921); three symphonies for string orchestra; two symphonic suites; *Poème* for piano and orchestra; five string quartets; and other chamber music.

**MILHAUD, GASTON** (1858-1918). A French philosopher. With his death in 1918, French philosophy lost a rare type of scholar, combining a vast fund of historical and scientific erudition with a creative critical mastery. He sided with the pragmatists in their attack on the stereotyped intellectualism of the schools but was withal a rationalist who had faith in reason and in its spontaneous self-imposed discipline. His *Descartes Savant* was published posthumously in 1921. It is a collection of well-documented studies revealing a side hitherto little known of the thinker often styled "the patron saint of French philosophy."

**MILITARISM.** See WAR IN EUROPE.

**MILITARY TRAINING CAMPS.** See ARMIES AND ARMY ORGANIZATION.

**MILITIA.** See ARMIES AND ARMY ORGANIZATION.

**MILK SUPPLY.** See DAIRYING.

**MILLAY, EDNA ST. VINCENT** (1892- ). An American author, born in Rockland, Me. She received her bachelor's degree from Vassar College in 1917 and since then has lived in New York City. She is the author of *Renascence and Other Poems* (1917); *Figs from Thistles* (1920); *Second April* (1921); *Aria da Capo* (1921); *The Lamp and the Bell* (1921), and *Two Slatterns and a King* (1921). Her work is finely conceived, and she is regarded as one of the foremost poets in America to-day.

**MILLE, PIERRE** (1864- ). A French novelist (see VOL. XV). He developed an entertaining and artistic novel along the lines of the old-fashioned "romance." Among his later writings are *Le Monarque* (1914); *Sous Leur Dictée* (1917); *Trois Femmes*; *Histoires Exotiques et Merveilles*; *Nuit d'Amour sur la Montagne* (1920); *L'Ange du Bizarre* (1921); *Myrrhine: Images Exotiques et Françaises*; *Monsieur Barbe Bleue . . . et Madame* (1922).

**MILLER, ALICE DUER** (1874- ). An

American author, born in New York City. She graduated from Barnard College in 1899 and in the same year married Henry Wise Miller. Her stories cleverly portray certain aspects of social life. Her works include: *The Modern Obstacle* (1903); *Calderon's Prisoner* (1904); *Less Than Kin* (1909); *Blue Arch* (1910); *Are Women People?* (1915); *Come Out of the Kitchen* (1916); *Ladies Must Live* (1917); *Wings in the Night* (1918); *The Charm School* (1919); *Manslaughter* (1921); and *Are Parents People?* (1924).

**MILLER, DAVID HUNTER** (1875- ). An American lawyer, born in New York City. He graduated from the New York Law School in 1910 and in the year following was admitted to the bar and began practice. He served as special assistant in the Department of State in Washington in 1917 and 1918 and was attached to the mission of Colonel House in Paris. During the peace negotiations he acted as technical adviser to the American Commission and with J. B. Hurst drew up the final draft of the Covenant of the League of Nations. After a short service in the Department of State he became counsel to the German government on the Upper Silesian question before the League of Nations in 1921. He served in the Spanish-American War and was the author of *Secret Treaties of the United States* (1910); *Reservation to Treaties* (1919); *International Relations to Labor* (1921), and many monographs and articles on international and legal subjects.

**MILLER, DAYTON CLARENCE** (1866- ). An American physicist, born at Strongsville, Ohio, and educated at Baldwin University and Princeton. During 1888-89 he was professor of natural science at Baldwin University and in 1890 went to the Case School of Applied Science as instructor in mathematics and physics, where he became professor of physics in 1895. Dr. Miller contributed important papers to scientific journals on the velocity of light in magnetic field, relative motion of earth and ether, efficiency of incandescent gas light, photographic registration of sound waves, quality of musical sounds, and similar subjects. In 1914 he gave a course of lectures before the Lowell Institute. Besides his many papers, he is the author of *Laboratory Physics* (1903), *Boehm on the Flute and Flute Playing* (1908), and *The Science of Musical Sounds* (1916).

**MILLER, JOHN ANTHONY** (1859- ). An American astronomer, born at Greensburg, Ind. He studied at Indiana, Stanford and Chicago Universities. He was instructor in mathematics at Indiana and superintendent of schools in Rockville, Ind., after which he taught mathematics at Stanford and returned to Indiana in 1894, where in 1895 he became professor of mechanics and astronomy. In 1906 he was called to the chair of mathematics and astronomy at Swarthmore College, of which he became vice president (1913- ), and director of the Sproul Observatory (1911- ). He was chief of the solar eclipse expedition sent by the University of Indiana to Spain in 1905 and of that sent by Sproul to Brandon, Colo., in 1918. His studies of stellar parallax, the solar corona, and measurements of double stars resulted in valuable contributions to the progress of astronomy. Dr. Miller is the author of *Trigonometry for Beginners* (1896) and *Analytic Mechanics* (1915).

**MILLER, RICHARD E.** (1875- ). An American artist (see Vol. XV). He was elected to the National Academy in 1915 and in the same year won the medal of honor of the Panama-Pacific International Exposition. He had in the previous year been awarded the Potter Palmer medal and the \$1000 prize of the Art Institute of Chicago and the Thomas S. Clark prize of the National Academy of Design.

**MILLERAND, ALEXANDRE** (1859- ). A French statesman (see Vol. XV). He was general commissioner of the Republic of Alsace and Lorraine in 1919-20, and Minister of Foreign Affairs in January, 1920. In the same year he became President of the French Republic. After defeat in both Houses of Parliament, when the majority voted not to sustain any government named by him, President Millerand resigned on June 11, 1924. Among his later publications is *La Guerre Libératrice* (1918).

**MILLIKAN, ROBERT ANDREWS** (1868- ). An American physicist, born at Morrison, Ill. He studied at Oberlin and Columbia and in Göttingen and Berlin, and in 1910 became professor of physics at the University of Chicago. In 1921 he became director of the Norman Bridge Laboratory of Physics at the California Institute of Technology at Pasadena. He also lectured at California (1917) and at Amherst (1917). His original researches had much to do with the composition of matter. He was the first to succeed in isolating an electron. Professor Millikan's brilliant successes gained for him the Comstock prize of the National Academy of Sciences in 1913 and the Nobel prize in physics in 1923. During the War he was vice-chairman of the National Research Council and afterward chairman of the science and research division of the Signal Corps, with the rank of lieutenant-colonel. In addition to membership in many scientific societies at home and abroad, he is a fellow of the American Academy of Arts and Sciences, a member of the American Philosophical Society, and since 1915 a member and foreign secretary of the National Academy of Sciences. He is the author of textbooks and other volumes which include: *A Course of College Experiments in Physics* (1898); *Mechanics, Molecular Physics, and Heat* (1901); *Electricity, Sound and Light* (1908); and *The Electron* (1917).

**MILLS, JAMES EDWARD** (1876- ). An American chemist, born at Winnsboro, S. C., and educated at Davidson College and at the University of North Carolina. During 1900-10 he taught at the State university and became associate professor in 1904. After some years on the faculty of the University of South Carolina, he became professor there in 1913. In 1921 he was appointed technical director of research and development work for the Chemical Warfare Service at Edgewood Arsenal. During the War he was a captain in the Engineer Corps (1917) and then passed to the Chemical Warfare Service (1918). His special researches, on which he published papers, had to do with subjects in the field of physical chemistry, such as molecular attraction, heats and vaporization of liquids, and specific heats.

**MILLS COLLEGE.** A college for women at Oakland, Cal., founded in 1885. The number of students increased from 127 in 1914 to 546 in 1924, the faculty from 37 to 72 members and the library from 15,000 to 31,000 volumes. The

productive funds rose from \$260,550 to \$1,290,284, the endowment from \$452,280 to \$1,470,938 and the annual income from \$71,545 to \$471,545. An ambitious building programme was carried on during the period. Alumnae Hall was completed in 1916; Warren Olney Hall, a \$120,000 residence hall, in 1917; an annex to Science Hall in 1918; Orchard House in 1918 at a cost of \$65,000; Meadow House in 1921 at a cost of \$70,000; and the Mary Keyser Chemical Laboratories, grouped about a central court, in 1922. Aurelia Henry Reinhardt, Ph.D., LL.D., succeeded Luella Clay Carson, Litt.D., as president.

**MILLSPAUGH, ARTHUR CHESTER** (1883- ). An American administrator of Persian finances, born at Augusta, Mich., and educated at Albion College, the University of Illinois, and Johns Hopkins. After teaching political science for two years and working in the drafting office of the United States State Department for three more, he became acting foreign trade adviser in 1921-22. When Persia requested that an American financial adviser be sent to Teheran, Dr. Millspaugh was appointed, and he and his staff reached the Persian capital in November, 1922. He found the Persian treasury empty and the fiscal administration a chaos, but with the help of the Persian authorities and the military, he straightened matters out. A budget was established, taxes were collected, and brigandage greatly diminished.

**MILLSPAUGH, CHARLES FREDERICK** (1854-1923). An American botanist, born at Ithaca, N. Y., and educated at Cornell University and the New York Homeopathic Medical College. For several years he practiced medicine and from 1891 to 1893 taught botany at West Virginia University. In 1894 he was appointed curator of the department of botany of the Field Museum of Natural History; from 1897 to 1923 he was professor of medical botany at the Chicago Homeopathic Medical College. He was also lecturer on botany at the University of Chicago. Millspaugh carried on explorations in the West Indies, Brazil, and other parts of South America, and was the author of *American Medical Plants* (1887), *Flora of West Virginia* (1891), and many articles in scientific and popular journals.

**MILNE, A(LAN) A(LEXANDER)** (1882- ). An English journalist and playwright, educated at Cambridge. He is best known in America for his plays. He was assistant editor of *Punch*, 1906-14, and served with the Royal Warwickshire Regiment during the War. His plays include: *Wurzel-Flummery* (1917); *Belinda Make-Believe* (1918); *Mr. Pim Passes By* (1919); *The Romantic Age* (1920); *The Truth About Blaysds* (1921); *The Dover Road* (1922); *The Great Broxopp* (1923) and *Success* (1923). Among his other publications are *The Day's Play*; *The Holiday Round*; *Once a Week*; *Once on a Time*; *Not That It Matters*; *If I May*; *Mr. Pim*; *The Red House Mystery*; *The Sunny Side*.

**MILNER, ALFRED**, first VISCOUNT (1854- ). An English statesman and administrator (see VOL. XV). After a long retirement from politics, he became a member of the war cabinet, without portfolio, in 1916, and in the following year conducted a mission to Russia. In 1918 he was Secretary of State for War and in 1919 Secretary of State for Colonies. In 1920 he was head of the Commission to Egypt

and made the report on conditions there which resulted in the establishment of the independent rule of that country.

**MILWAUKEE.** The largest city in Wisconsin. The population rose from 373,857 in 1910 to 457,147 in 1920 and to 492,087, by estimate of the Bureau of the Census, for 1924. The board of public land commissioners was active in city planning between 1914 and 1924. A zoning ordinance regulating the height, use and area of buildings in the various districts of the city was adopted in 1920. Land was acquired for a civic centre adjoining the public library-museum and the auditorium. It involved the condemnation of 11 additional city blocks, the construction of a mile-long, 180-foot plaza extending to Lake Michigan and the enlargement of Juneau Park at the end of the plaza where the outlined lake drive will begin. A park and boulevard system, in coördination with the directed platting of new subdivisions, and the construction of playgrounds within half a mile of each child were under way in 1924. The greater part of the land along Lake Michigan has been acquired by the city. The garden homes housing development, which was entered into jointly by the city and county in 1920, was said to be the first of its type in the United States. Land was purchased, and by 1924, 105 houses were completed and sold to citizens on the installment plan, to be owned on a coöperative basis.

The greater harbor project involving the construction of an outer harbor in Kinnickinnic Bay, the development of an extensive system of docks and warehouses, and the unification of railway terminals was carried forward by the harbor commission. Land in Jones Island was reclaimed for the outer harbor by dredging the waterway and filling behind new bulkheads. The Federal government was constructing 1700 additional feet of caisson breakwater. A \$13,000,000 modern sewage disposal plant on Jones Island, operating on the activated sludge system of disposal and capable of handling 100,000,000 gallons of sewage a day, was half completed in 1924, and 33 miles of deep intercepting sewers and 9.4 miles of main sewer were being built. In 1921 the city completed a municipal street lighting system of gas-filled incandescent tungsten lamps. A new intake and new \$1,000,000 pumping station were constructed, a trailer system of ash and garbage collection was installed, and mechanical snow loading machines were adopted. The health department also was very active, supervising the health of children in the schools and holding child welfare clinics. The continuation school, completed in 1923, under an independent tax levy and governed by an independent board selected by employers and employees, was praised as a model school by educators in the United States and Europe. Almost 7000 children and apprentices were enrolled for day sessions and over 6000 adults at night, pursuing courses of study in 100 subjects. The public library, extending its service, was the first to supply a trained worker in adult education to reach the various extension classes, clubs, trade unions, and other organizations, and giving each hospital patient bedside book service. The Art Institute first received municipal support in 1918, which culminated in 1922 in an agreement whereby the city was to acquire full ownership in 1932. In

1923 a civic symphony orchestra was started, giving concerts biweekly in the auditorium. Milwaukee attained the best financial standing and credit of all the cities in the country as the result of a scientific budget system, the elimination of all bonds for operating expenses, the rapid changing of all departments to a cash basis, half completed in 1924, and the economies made possible by a centralized purchasing department paying cash for all work, including contracting. An amortization fund, established in 1923, was expected ultimately to wipe out the entire public debt. The offices of 12 aldermen-at-large were discontinued. See CITY PLANNING.

**MILWAUKEE-DOWNER COLLEGE.** A college for women at Milwaukee, Wis., founded in 1849. The number of students increased from 278 in regular courses and 67 in extension in the year 1914-15 to 352 in regular courses and 98 in extension in 1923-24, and the number of faculty members from 37 to 42. The library increased from 10,875 volumes and 1400 pamphlets to 19,400 volumes and 10,000 pamphlets, and the productive endowment funds rose from \$216,207 to \$799,857. The curriculum was expanded during the 10 years by the introduction of a two years' course in occupational therapy, first offered during the War, and courses in public school music, with diploma at the end of two years, library economy, and Spanish. The degree of Bachelor of Science in Nursing was introduced in 1918. Lucia R. Briggs, M.A., succeeded Ellen C. Sabin, M.A., Litt.D., as president.

**MILYUKOV, PAVEL NIKOLAEVITCH** (1859- ). A Russian politician and historian. He was educated at the University of Moscow from which he was expelled for a time for taking part in students' riots. After graduation he lectured at the university till dismissed in 1894 because of his liberal opinions. He was later appointed professor at the University of Sofia, Bulgaria, and afterwards lectured successfully in the United States. Returning to Russia in 1905, he took part in forming the constitutional democratic party (Cadets), becoming its leader and editing its organ *The Retch*. He was elected to the third and fourth Dumas. In 1914 he favored the Allies but felt that the men then ruling Russia should be overthrown. Later he opposed Kerensky's policy. After the Armistice he went to London and then to Paris, and in 1921 he directed the journal, *Last News*.

**MINE, SUBMARINE.** In the War the submarine mine played a most important part. The numbers used and the areas planted were so enormously greater than in any previous war—indeed, than in all previous wars combined—as to make such former use seem trivial. The various types of mines were much improved during the War and the methods of planting and sweeping were revolutionized. Both the British and Germans were much impressed by the use of mines in the Russo-Japanese War and were prepared at the outbreak of hostilities to use them in great numbers. At this time, due to war experience, the Russian mine was probably the best but, as the Germans picked up Russian mines early in the war, they were able to improve their own. British, French, Italian, and American mines were improved by experience and from inspection of captured German mines, but it was not until September, 1917, that the

improved British mine began to be turned out in adequate quantities. The improved American mine began to be manufactured in enormous numbers in the latter part of 1917. Some new types of mines were developed during the War such as the depth bomb (see BOMB, DEPTH) and the British net mine. The Leon drifting mine, which was brought out just before the War, was used with great effect in the Dardanelles where the conditions exactly suited it.

As each nation endeavors to keep the design of its mines as secret as possible, descriptions of British and American mines are not published. The plans of the German mines were derived from a careful examination of captured ones. The mooring rope reel was secured to the mine-case and not to the anchor. Anchor and mine were held together by a device locked with a sal-ammoniac plug. When dropped, mine and anchor sank slowly to the bottom where they remained until the dissolving of the sal-ammoniac plug allowed glycerine to escape from beneath a plunger in a dashpot. The mine was then released and rose until, at the required depth below the surface, the reduction of pressure allowed a clamp to securely grip the anchor rope. The main firing circuit was closed by the tension on the mooring rope as soon as the mine started upward, but the battery was still inoperative. Several contact horns protruded from the case, each horn consisting of a small lead cylinder enclosing a glass tube that contained the electrolytic fluid. Directly below each horn and inside the case there was a brass cylinder that had in its upper part the terminal plates of a battery the wires from which passed through a wooden plug into the detonating fuse, though each zinc wire is brought to the filling hole where the circuit is kept broken while the mine is being handled. Over each lead contact horn was screwed a brass safety cylinder that was removed before the mine was dropped. When one of the contact horns was struck by a passing vessel, the lead cylinder was bent and the glass container inside it broken. The electrolyte then poured into the brass cylinder beneath and completed the formation of a battery that produced a current and exploded the mine. Though their efficiency was admitted, neither the German nor the Russian mine was copied in England as their cost (about \$1000) was deemed excessive.

The Leon floating mine was invented by a Swedish officer. It is cylindrical in shape and may be dropped in the usual way or expelled from a torpedo tube. The weights are so adjusted that it floats with its axis vertical. The upper half contains the explosive and firing mechanism and the lower half is divided into a water reservoir, that fills where the mine is dropped, and the compartment for the depth mechanism. The latter consists of a battery and motor, driving a propeller on a vertical shaft, and a hydrostat which starts the propeller to lift the mine when it sinks beyond the designed depth and stops it when it reaches the upper limit. With the chamber filled the mine is only slightly heavier than water and is easily kept from 5 to 15 feet below the surface.

At the outbreak of war the Germans promptly laid minefields along their own coast and began laying small areas or lines off the British coast. The first British minefield was laid ear-

ly in October north of Ostend and designed to check the passage of German submarines through the Channel. Others were placed off British harbors. During 1915, 15 small minefields were laid off the Belgian Coast and others in German waters. In that year the Germans first began to use submarine mine-layers and in 1916 the British also used them. In the latter part of 1916 the British laid the Belgian Coast barrage, 12 miles off the Belgian Coast and 40 miles long, supplemented by mine nets about a mile from the mines.

Early in 1917 a deep net barrage was laid across the Straits from the Goodwins to Snou Bank, supplemented with deep set mines. The nets dragged and the field had to be swept and relaid. During the year 1917, 15,686 mines were laid by the *Abdiel* (ex-destroyer) and five mine-laying submarines. But it was not until September, 1917, that an efficient mine began to be turned out in adequate quantities to warrant undertaking any of the extensive projects that had been under consideration.

The greatest of these projects was the closing of the entrances to the North Sea—the channel at Dover and the northern passage from the Orkneys to Norway, the latter requiring a mine-field 250 miles long. The mines were dropped at 300-foot intervals and there were 10 rows at a depth of 65 to 80 feet, 4 at about 160 feet, and 4 at about 240 feet. The work was begun in March, 1918. In May, the American Mine Squadron No. 1, consisting of nine large mine-layers having a total capacity of 5530 mines, arrived at Invergorden, Scotland. The work was completed in the next five months. The British laid 13,546 of their own mines; the American squadron laid 56,571 American mines and 899 British; total, 70,117. The Dover barrage contained 9500 mines.

The mine played a most important part in the war. Its threat of danger curbed the activities of U-boats by compelling them to proceed to their destinations by difficult channels over vastly longer distances; and, of about 200 boats lost, 43 are known to have been destroyed by mines. Probably 7 or 8 of those whose fate is unknown were sunk in minefields, while many others were so badly injured as to force a return to base. The British losses from mines were:—5 battleships (13 lost from all causes), 1 cruiser (13 lost), 2 light cruisers (12), 5 sloops (18), 20 destroyers (64), 4 submarines (54).

Extensive mining operations were carried out in the Mediterranean and elsewhere but compared to the great North Sea work they were relatively small. The vast number of mines laid across harbor entrances and other routes of commerce and of war vessels made the operation of mine-sweeping as important as mine-laying. The entrances to many ports were swept daily and the channels leading to others were constantly patrolled and swept if mines were reported in them or in their vicinity. On Nov. 11, 1918, the total number of minesweepers in the British service alone was 726, and large but lesser numbers were in use by the other Allies (including the United States). See *VESSELS, NAVAL*, *Minelayers* and *Minesweepers*; *Naval Operations* under *WAR IN EUROPE*; *BOMB, DEPTH*; *PARAVANE*; *BOMBING OF VESSELS*, etc.

**MINERALOGY.** Developments in this science during the decade 1914–24 included the discovery and description of several new mineral species, experiments in the artificial production of minerals, and the study of mineral properties, chemical and physical, with the use of more refined or elaborate methods than were previously available. Among general works for students of the subject published during the period may be mentioned Bayley's *Descriptive Mineralogy* (1917), a new work, not a revision of an old one.

**New Minerals.** The possibilities of the occurrence of undiscovered species are still far from exhausted, apparently, for many new compounds or specific variations of known types were brought to notice each year. The listing of the new names is hardly warranted in this place, as all of them are of minor importance in both distribution and economic value, and many are simply varieties of known forms distinguished by some special property.

**Experiment and Research.** For investigations of the fundamental characteristics of minerals, the work of the Carnegie Geophysical Laboratory was of signal importance. Its endowment of technical equipment and the skill of its staff put the institution on a unique basis in this branch of research. One of the tasks it undertook was the investigation of the rock-forming silicates, in which much interest centres on account of their bearing on the formation and conditions of stability of the ingredients of igneous rocks. Rankin, in a study of the system lime-alumina-silica, reproduced such minerals as quartz, tridymite, cristobalite, corundum, wollastonite, sillimanite, and anorthite, besides many calcium silicates not known to occur in nature but present in certain artificial products. The results throw light also on the compounds formed in the hardening of Portland cement. Andersen experimented with the system anorthite-forsterite-silica and explained some of the features of the basic igneous rocks. Johnston, Merwin, and Williams discovered important features of calcium carbonate, particularly that the substance has three phases, two of which only had been known to occur in nature. For the experiments of Bowen in the crystallization of melts, see *GEOLOGY*. Allen determined the true chemical structure of the mineral bornite, one of the important copper ores. The artificial production of diamonds continued to attract interest, and the latest trials have been made by Sir Charles A. Parsons, the English inventor, who secured transparent crystals up to seven-tenths of a millimeter in diameter. Contrary to the conclusions of Moissan, who first succeeded in making diamonds, the more recent work indicated that great pressure and heat were not the essential factors in effecting the crystallization of carbon in a molten bath: it appears that the diamond forms at a temperature around 690°C., below the freezing point of the iron matrix, through the reactions of occluded gases. The results, if not wholly successful, were very suggestive and will doubtless encourage further investigation.

A means of distinguishing artificial rubies, the manufacture of which has been brought to a high state of perfection, was given by Michel. The artificial stones have a concentric banding

and lines of bubbles, arising from the process of depositing the molten aluminum oxide. The pear-shaped melt shows an optic axis diagonal to the longer diameter. No methods had been found to make synthetic emerald, topaz, peridot, or phenacite. The disperse colors of quartz, according to Watson and Beard, may be referred to the effects of small amounts of foreign substances, of which the commonest are manganese, iron, and titanium oxides. Amethyst contains more than the average amount of manganese, which is present in colloidal form and imparts a purple color. Rose quartz is probably not attributable to an inorganic substance, for it can be bleached by heat, after which the color cannot be restored by exposure to the sun's rays. Blue quartz contains fine rutile crystals which are arranged after a definite pattern and cause dispersion.

**MINIMUM WAGE.** A conspicuous feature of minimum wage legislation in the United States was that, although 10 of the 14 laws in force in 1923 applied to male minors as well as to females, in no case had an attempt been made to extend such legislation to men. Such restriction of wages, an unquestionable limitation of the right of free contract, was held justifiable under the police power as a protection to public health, safety, and morals, in the case of women as mothers and potential mothers; but not justifiable in the case of men, who, furthermore, were more successful in bargaining for themselves. Massachusetts, in 1912, was the first State to adopt such a minimum wage law. It was followed in 1913 by nine States: California, Colorado, Minnesota, Maine (declared unconstitutional in 1914), Nebraska (repealed in 1919), Oregon, Utah, Washington, and Wisconsin. Arkansas and Kansas passed their laws in 1915; Arizona, in 1917; the District of Columbia, in 1918; and North Dakota, Porto Rico, and Texas, in 1919; and in 1923 a law became effective in South Dakota. With the repeal of the Texas law in 1921, there were 13 States, in addition to Porto Rico and the District of Columbia, with such legislation, although no action had been taken under the Colorado act. A minimum wage bill was passed by the Senate but defeated by the Assembly in New York in 1924. Almost all the laws were general in scope, covering "any trade, occupation, or industry in which women and minors are employed"; although in some States certain occupations were specified or excluded, and in no State had a rate for domestic service or farm labor been fixed. In many instances there were clauses restricting the number of working hours and requiring that overtime be paid for at an increased rate; another common provision was that for the issuance of certificates to defectives, allowing them to work for a lower rate than that prescribed. With the exception of the Massachusetts law, all the State measures involved the power to fix a minimum, prescribed in the statute in three States, while in the others it depended on an award of a board or commission, based on a study by the body of living costs. In Massachusetts, which had the award system of determining the wage, the law was not mandatory and depended for its enforcement on public sentiment. An effort to make violation of the law a misdemeanor and punishable as such and so to bring the Massachusetts bill into line with all the others in this respect, was defeated in 1923, when a spe-

cial commission, after an investigation, brought in an adverse report. In most States the amount of the award is based on a study of the cost of living and is given in terms of a weekly wage rate. To what extent the wages of women and minors were affected by this legislation from 1914 to 1924 is difficult to determine. The fixed minimum varied, in the same year, not only with age and experience and class of labor, but also with regard to the population of localities; in addition to this, the rise in the cost of living and the inflation of currency must be taken into account. Attempts to set a living wage for women, however, seem to have aimed generally at a weekly rate from \$8 to \$9 between 1914 and 1917; in 1918, in Washington, at \$9 for minors and \$13.20 for experienced adults. In 1923, \$13.30 and \$12 for the experienced adult in Massachusetts and South Dakota, respectively, compared with a minimum of \$16 in California and Arizona, and a minimum as low as \$7 for smaller towns in some of the States. Available records indicated that the setting of a minimum had little if any tendency to decrease the maximum wage. Activity during the decade consisted largely of the issuance of orders extending the minimum wage principle to various classes of industries and the enactment of measures to close up loopholes of evasion. A characteristic expansion of the regulation is that of Massachusetts. The first decree in that State, in 1914, applied to brush-making; the second, effective in 1915, to laundries; 1916, retail stores; 1917, women's clothing factories; 1918, men's clothing and raincoats; 1918, men's and boys' furnishings; muslin underwear, petticoats, aprons, kimonos, women's neckwear, and children's clothing; millinery and office or building cleaning; 1920, candy making, corsets, knit goods, paper-boxes, etc.; in 1923, with the formation of a wage board for establishments manufacturing druggists' preparations, 17 occupations had come under review since the enactment of the law, and wage decrees had been issued for 16 occupations, affecting from 70,000 to 80,000 women. Among the controlling measures found necessary during this period was that of Massachusetts, providing for the publication of the names of employers who persistently violated minimum wage decrees; in other States the length of apprenticeship and the proportion of apprentices was definitely set, and a sliding scale of wages for apprentices was created, to prevent discrimination against those subject to the rate for experienced workers.

The critics of minimum wage laws continued to insist that it was class legislation: it did not fix a fair day's work to protect the manufacturer; a fair living wage could not be determined; the legislation was circular in effect, raising the cost of living in proportion to the increase in wages; it produced unemployment; it put States enforcing such laws at a disadvantage compared with those which had none. Attacks on the constitutionality of such measures were continuous, beginning in 1914, when the law of Maine was declared void as an unconstitutional delegation of legislative power to an appointed body and as an interference with both employer and employee. The outstanding case, however, was that of Oregon, in 1917, when the Supreme Court of the United States split evenly on its decision, thus leaving in effect the favorable ruling of the State Supreme

Court. Following this, favorable decisions were also brought in, apparently with misgivings, on cases which had meanwhile been pending in the State Supreme Courts in Arkansas and Minnesota; and in 1918 a similar case in Washington had a like issue. In 1923, however, the Supreme Court of the United States decided against the minimum wage measure of the District of Columbia as an interference with the freedom of contract guaranteed by the due process clause of the Fifth Amendment. This decision was disconcerting. Nevertheless, the States generally, taking it to apply only to the points raised in this particular law, proceeded with the administration of their respective acts. In Arizona the State officials announced their intention to support their new wage law, which raised the minimum from \$10 to \$16 a week; and the industrial commission of California was not deterred from handing down a new wage award. The California Legislature, moreover, memorialized Congress to adopt a constitutional amendment to permit such legislation by States; and the Governor of Washington advocated a conference of governors to campaign toward that end. In Oregon, the Manufacturers' and Merchants' Association pledged support and coöperation in maintaining the State law and in discouraging any attempt to repeal it or to test its validity in the courts. On the other hand, test cases had been started in Arizona and in Wisconsin; in Massachusetts the publicity method of enforcement had been brought up for settlement. Conferences were called by various labor and other organizations to consider the situation. The general attitude seemed to be divided between a desire to curtail the power of the Supreme Court, either by requiring a seven to two or a six to three vote, or by requiring a change in their decision if an act were again passed in Congress by an increased majority, and a desire for a constitutional amendment, either broad enough to permit the enactment of all welfare or social legislation, or one making possible at least minimum wage legislation for women workers.

**Other Countries.** In Australia, where the first serious political step toward the prevention of sweating in industry was taken in 1896, minimum wage legislation by 1915 covered 141 trades employing over 150,000 workmen and was considered to be beyond the experimental stage. Sweating had been abolished, and opposition to the principle on the part of either capital or labor was practically non-existent. In England, the movement had steady and successful growth, beginning with the Trades Boards Act of 1909, which established a minimum wage in the sweated trades. One act, passed in 1912 to terminate a general strike among coal miners, provided that a certain minimum should be part of their contract of service and enforceable in ordinary courts of law. A minimum wage was fixed for agricultural laborers by the Corn Production Act of 1917. The principle, in fact, was much in use during the War to keep wages consistent with the increased cost of living; the Trades Boards Act was extended in 1914 to cover additional occupations, affecting 400,000 workers, chiefly women; after the Armistice it was made use of to keep wages from falling suddenly during the period of adjustment. A new Trades Boards Act, passed in 1918, greatly extended the scope of the previous measure. By the end of 1922 there were in ex-

istence 63 boards, covering 39 trades and affecting the wages of approximately 3,000,000 workers, both men and women. Over a period of 14 years, the system appeared to have been effective in securing more commensurate wages even for the semiskilled and the skilled worker, and in reducing the normal number of hours per day and the amount of overtime; it did not seem, either through eliminating the less efficient worker or through driving employers out of business, to have had any effect on unemployment. That it was not wholly satisfactory, however, was indicated by a bill providing for certain changes, which failed of passage in 1923. Although the first minimum wage regulation in Canada was a clause of the Factories Act of Alberta as late as 1917, seven of the provinces (all except New Brunswick and Prince Edward Island) had such laws, by 1923; five of them included also provisions for hours; all of them, with the exception of the Alberta clause, applied only to women and children. The British Columbia law (1918) provided for a board to ascertain wages paid and to call a conference of employers, employees, and public representatives to fix and enforce suitable wages; it exempted from the provisions farm laborers, fruit pickers, and domestic servants; the Manitoba law (1918) applied only to shops, mail order houses, or factories in cities, but gave jurisdiction in limitation of hours and sanitary and other conditions; Quebec, in 1919, established a board with power of investigation; Saskatchewan's board, created in that year, was given power to fix wages without calling a conference; the laws of Ontario and Nova Scotia came into force in 1920. In France, special wage boards were created, in 1915, to fix a minimum piecework rate based on prevailing wages, applying chiefly to women engaged in home work in the clothing industry; and their power was extended in 1922 to include other industries employing home labor. Norway, in 1918, provided a home workers' commission, to establish special boards in any trade, on request, and to fix minimum wages for both time-work and piecework; in Prussia, in 1918, a Wages Department was formed under the general supervision of the German Wages Department. Switzerland, where the ultimate wage-fixing authority rested with the state department, established a number of wage boards during the period; and Argentina, in its budget law of 1923, provided for a minimum wage for government employees. See LABOR LEGISLATION; LAW, PROGRESS OF, *Constitutional Law*.

**MINNEAPOLIS.** The largest city of Minnesota. The population increased from 301,408 in 1910 to 380,582 in 1920, and 417,280, by estimate of the Bureau of the Census, for 1924. A city planning commission was created in 1919 following the proposed city plan prepared two years previously; this, in turn, was followed by a zoning law under the authority of which a zoning ordinance was adopted by the city council. A central coordinating financial body was created in 1919 under the title of Board of Estimate and Taxation, the Board of Charities and Corrections was reorganized into the Board of Public Welfare, and a Municipal Pension Board was created. In 1920 the city voted to accept home rule, and in the following year a citizens' charter committee proposed a new city manager charter, which was under discussion in 1924.

Minneapolis was made head of navigation on the Mississippi in 1917 on completion of the government high dam. The city had prepared preliminary terminal facilities. Four important bridges were built spanning the Mississippi, one over the Falls of St. Anthony; another was the Cappelen Memorial, containing the world's largest single concrete arch of 400 feet, a third was constructed in coöperation with St. Paul. Two monumental bridges were under construction in 1924, one nearly a mile long, over the Minnesota River. An extensive building programme, especially developing the junior high schools, placed Minneapolis in fourth rank in percentage enrolled in the high schools. The park system was enlarged by the addition of 491 acres, and over 24 miles of boulevards and parkways were paved. Funds for a new auditorium were voted by the Legislature and ratified by the voters. After investigation of the street lighting methods of many cities in 1922, a beginning was made on the installment of a new system. In 1919 a proposed new street railway franchise was rejected by referendum, and two years later the Legislature placed the street railway company, for valuation and rates, under the Railroad and Warehouse Commission.

**MINNEAPOLIS SYMPHONY ORCHESTRA.** See *MUSIC, Orchestra*.

**MINNESOTA.** Minnesota is the eleventh State in size (84,682 square miles), and the seventeenth in population; capital, St. Paul. The population increased from 2,075,708 in 1910 to 2,387,125 in 1920, a gain of 15 per cent. The white population rose from 2,059,227 to 2,368,936; negro, from 7084 to 8809; native white, from 1,516,217 to 1,882,772. The foreign white population decreased from 543,010 to 486,164. The urban and rural populations both showed increases: the former from 850,294 to 1,051,593; the latter from 1,225,414 to 1,335,532. The growth of the principal cities was as follows: Minneapolis (q.v.), 1910, 301,408; 1920, 380,582; St. Paul (q.v.), 214,744 to 234,698; Duluth (q.v.), 78,466 to 98,917.

**Agriculture.** As Minnesota is one of the principal grain-growing States, agricultural conditions in the decade 1914-24 were largely affected by the fluctuation in prices and production which characterized the War and post-war period. (See articles *AGRICULTURE, CORN, WHEAT*, etc.) The number of farms in the decade 1910-20 kept pace almost exactly with the increase in population; the population increased 15 per cent, the number of farms, 14.3 per cent (from 156,137 to 178,478). The acreage of land in farms increased from 27,675,823 to 30,221,758, or 9.2 per cent; and the improved land in farms, from 19,643,533 acres to 21,481,710, or 9.4 per cent. The total value of farm property showed an apparent increase, from \$1,476,411,737 in 1910 to \$3,787,420,118 in 1920; the average value per farm, from \$9456 to \$21,221. Farm land values greatly increased, as a result of war prices for farm products. In interpreting these values and indeed all comparative values for the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of the total land area in farms increased from 53.5 in 1910 to 58.4 in 1920; the percentage of improved land in farms,

from 38 to 41.5. Of the total of 178,478 farms in 1920, 132,744 were operated by owners, 1596 by managers, and 44,138 by tenants. The corresponding figures for 1910 were 122,104, 1222, and 32,811. White farmers in 1920 numbered 178,271, compared with 155,844 in 1910; colored farmers, 207, compared with 293. Farms free from mortgage in 1920 numbered 54,086; mortgaged, 69,545. In 1910 65,038 farms were free from mortgage and 56,145 were mortgaged. The total number of cattle in 1920 was 3,021,469; in 1910, 2,347,435. Dairy cattle numbered 2,080,627 and 1,085,388, in those years. This indicates the steady growth of the dairy industry. The State had reached second place in butter production with Wisconsin only slightly ahead of it. Hogs increased in number from 1,520,257 to 2,380,862. The number of sheep on the farms in 1920 was 509,064, compared with 637,582 in 1910. The estimated production of the principal farm crops in 1923 was as follows: corn, 152,987,000 bushels; spring wheat, 20,513,000; oats, 146,623,000; rye, 12,312,000; barley, 23,159,000; potatoes, 38,815,000; hay, 2,547,000 tons; and flaxseed, 5,318,000 bushels. Comparative figures, for 1913, are: corn, 96,000,000 bushels; wheat, 68,040,000; oats, 112,644,000; rye, 5,700,000; barley, 34,800,000; potatoes, 30,250,000; and hay, 2,490,000 tons.

**Mining.** Minnesota is the leading State in production of iron ore. Although it produces also important quantities of clay products, cement, and stone, it is iron which sets it high among mineral producing States. Minnesota was eleventh in value of mineral products in 1921. The fluctuations in output of iron ore in the decade 1914-24 are indicated by the following comparative figures: 1914, 21,946,901 long tons; 1915, 33,464,660 long tons; 1916, 44,585,422; 1917, 44,595,232; 1918, 41,953,969; 1919, 36,000,626; 1920, 39,453,173; 1921, 17,811,325. In 1922, 30,209,372 long tons were shipped from the mines. The diminished production in 1921 was due largely to the general business depression, which lessened demand for the products of iron ore. The value of the clay products, exclusive of pottery, fluctuated from \$1,944,886 in 1914 to \$1,503,659 in 1918; \$3,341,477 in 1920; and \$2,482,286 in 1921. In addition to the minerals mentioned above, there are also produced in the State manganese ore, mineral waters, and sand and gravel. The total value of the mineral products in 1921 was \$72,609,973; \$177,589,967 in 1920; \$131,529,797 in 1919, \$155,412,823 in 1918; and \$45,680,865 in 1914.

**Manufactures.** Minnesota is an important industrial State. In 1920 there were 11 cities with populations over 10,000, forming 33.6 per cent of the total population. These cities, in 1919, produced 63.3 per cent of the State's manufactured products. There were in the State, in 1909, 5561 manufacturing establishments; in 1914, 5974; and in 1919, 6225. Persons engaged in manufacture numbered 104,406, 115,690, and 147,678; and capital invested amounted to \$275,416,029, \$354,434,177, and \$679,386,486, in those years. The value of the manufactured products in 1909 amounted to \$409,419,621; in 1914, to \$493,354,136; and in 1919 to \$1,218,129,735. The increase in value of products from 1914 to 1919 was to a great extent due to changes in industrial conditions brought about by the War and cannot properly be used

to indicate the growth of manufactures between the censuses of 1914 and 1919, but the increase in number of establishments and in number of persons engaged in manufacture shows clearly a considerable growth in the manufacturing activities of the State. Flour mill and gristmill products were chief in point of value; in 1909, \$139,136,000; 1914, \$148,244,000; and 1919, \$381,249,000. Slaughtering and meat packing is the second industry in this respect: in 1909, \$25,754,000; in 1914, \$47,710,000; and in 1919, \$146,919,000. The manufacture of butter and cheese ranks third, amounting in 1909, to \$25,287,000; in 1914, to \$33,746,000; and in 1919, to \$91,720,000. The product of the lumber and timber industry, in fourth place, was valued at \$42,353,000 in 1909; \$44,675,000 in 1914; and \$52,580,000 in 1919. The principal manufacturing cities are Minneapolis, St. Paul, and Duluth.

There were in Minneapolis, in 1909, 1102 manufacturing establishments, with a product valued at \$165,405,000; in 1914, 1349 with \$187,854,000; and in 1919, 1421 with \$491,383,000. In St. Paul, in 1909, there were 719 with \$58,990,000; in 1914, 737 with \$68,682,000; and in 1919, 818 with \$149,638,000. Similar figures for Duluth were: in 1909, 194 with \$17,180,000; in 1914, 243 with \$19,729,000; and in 1919, 226 with \$75,261,000.

**Education.** Substantial progress was made in educational development in Minnesota, in the decade 1914-24. School districts were authorized to establish special departments for the instruction of physically handicapped children, subnormals, the deaf, blind, defective of speech, and crippled, and a special grant of \$100 to \$300 per child was allowed by the State for this work; provision was made through the State Department of Education for the rehabilitation of disabled persons; a law was passed requiring physical training and health instruction in all public schools and in all institutions for the training of teachers; and a new supplementary State aid law was enacted, guaranteeing to every school district \$40 per child on a \$.02 tax levy in addition to all other forms of State support, with the State paying the difference between what a \$.02 tax levy would produce for each pupil involved, and \$40. The school enrollment increased from 457,041 in 1914 to 540,843 in 1923; the number of teachers, from 16,920 to 20,841. The expenditures for all public schools was, in 1922, \$38,986,486. In 1923, the permanent school fund amounted to \$33,750,529. The percentage of illiteracy in the State decreased from 4 in 1910 to 2.4 in 1920; among the native white, from 0.5 to 0.4; among the foreign-born white, from 7.7 to 5.6; among the negro, from 3.9 to 3.5.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** The decade 1914-24 was an important one in the political history of the State. Minnesota, together with other northwestern States, was greatly affected by the agricultural situation in the years following the Great War. Among the farmers the so-called Farmer-Labor party acquired sufficient power to elect candidates for important offices, including two United States Senators. In 1914, in the elections for governor and other State officers and Representatives in Congress, W. S. Hammond, the Democratic candidate, was elected governor. The Republicans elected Representatives in all districts except one. On Au-

gust 12 of this year, the International Harvester Company was declared to be a monopoly in restraint of trade, and its dissolution was ordered by the United States District Court of St. Paul. In the elections of 1916, Minnesota was one of the so-called doubtful States. The voting for President was extremely close. Charles E. Hughes received 179,553 votes and President Wilson 179,157 votes. In the elections for State officers the Republicans elected their candidate for governor, J. A. A. Burnquist, and F. B. Kellogg was elected United States Senator. The Republicans again were successful in the elections of 1918, when Governor Burnquist was reelected, as was Senator Knute Nelson. The Non-Partisan League took part in the campaign and showed considerable strength. In 1919 A. C. Townley, president and organizer of the National Non-Partisan League (see NORTH DAKOTA), was convicted of disloyalty and sentenced to three months' imprisonment by the Martin County district court at Fairmount. Elections were held again in 1920 for governor and other State officers. The Republican candidate for governor, J. A. O. Preus, was elected, defeating H. K. Shipstead, Independent Farmer-Labor. In the presidential election of this year W. G. Harding received 519,421 votes and J. M. Cox 142,994. At this election the people approved amendments authorizing the construction of a trunk highway system, the taxation of motor vehicles, and the assessment of all real property used for railway purposes. In 1922 the Republicans again elected Governor Preus, but the Farmer-Labor organization developed such strength that it was enabled to defeat Senator Kellogg and to elect its candidate for the Senate, H. K. Shipstead. At this election the State voted to loan its credit for the assistance of farmers. As the result of the death of Senator Nelson in 1923, a special election was held to fill the vacancy. Governor Preus was nominated by the Republicans and James A. Carley by the Democrats. The Farmer-Labor party nominated Magnus Johnson, who in 1922 was an unsuccessful candidate for governor. After a stirring and picturesque campaign. Mr. Johnson was elected. F. B. Kellogg, former Senator, was appointed Ambassador to Great Britain in 1923.

**Legislation.** The most important acts of the legislature in the decade 1914-24, are noted below. The legislature, in 1915, passed a local option bill on a proposed amendment providing for State-wide prohibition, which was defeated in the House. The Senate defeated a bill providing for the submission to the voters of a constitutional amendment granting full suffrage to women. The legislature of 1917, however, provided for the submission of both the woman suffrage amendment and the prohibition amendment to the people in 1918. This legislature enacted a "blue sky" law and made provision for the voting of citizens absent from the State in the national service. It also created a public safety commission. The prohibition amendment lacked the necessary three-fifths vote, but the 1919 Legislature ratified both the proposed prohibition and women's suffrage amendments. It also provided for an eight-hour day on public work, and passed statutes defining and punishing criminal syndicalism and sabotage. The Legislature of 1921 regulated aircraft and created the office of Commissioner of Agriculture and empowered him to aid coöperative

bodies engaged in buying and selling farm products. The manufacture or sale of adulterated or misbranded drugs was forbidden. The office of Labor Commissioner was abolished and an Industrial Commission was created. Provision was made for the enforcement of the laws relating to intoxicating liquors. The compulsory school laws were amended; a workmen's compensation insurance board was created; and amendments were made to the workmen's compensation law. In 1923 the legislature passed a measure forbidding the wearing of masks in public places with the intent to conceal the wearer's identity. A measure was also enacted to facilitate cooperative marketing of agricultural products, and provisions were made for creating associations for this purpose.

**MINNESOTA, UNIVERSITY OF.** A State institution, founded in 1868, with its main campus in Minneapolis, the department of agriculture in St. Paul, the graduate medical school in Rochester, and agricultural experiment stations in Crookston, Morris, Grand Rapids, Duluth, Waseca, and Zumbra Heights. In 1913-14, the number of resident students of collegiate grade was 4155; the total registration, including extension, subcollegiate, etc., was 8992. In the fall term of 1923-24, the resident students of collegiate grade numbered 8992; total registration, 13,594. The total annual residence registration of collegiate grade, including summer session, was above 12,000. The growth between these two dates was steady, except for 1917-18, when the collegiate registration was 5567. The faculty increased over the 10 years from 608 to 1250, the library from 175,000 to 380,000 volumes, and the income from \$2,445,491 to \$7,088,094. The method of instruction was changed in 1918 from the semester to the quarter system. A School of Business was established and courses in Americanization training work, training for the diplomatic and consular services, for State and Federal administration, and for municipal administration and engineering, and courses for teachers and supervisors of physical education were added. The dental course was lengthened from four to five years, the extra year to be taken in pre-dental work in the College of Arts and Sciences. Under a legislative appropriation voted in 1919, of \$560,000 a year for 10 years, the following new buildings were finished or in the course of construction in 1923-24: on the main campus, a music building costing \$259,000; mines experiment station building costing \$311,000; library, \$1,255,000; storehouse and shops building, \$154,000; an addition to the Minnesota Union, \$50,000; on the farm campus, two home management houses at a cost of \$30,000, and a dairy building costing \$215,000; at Crookston, an animal products building costing \$16,000, and a beef cattle barn to cost \$12,000; at Morris, a hospital to cost \$14,000. Dr. William J. Mayo and Dr. Charles H. Mayo of Rochester, Minn., have given over \$2,000,000 for medical research and examination. A trust fund of \$250,000 was established in 1923 by the Citizens' Aid Society of Minneapolis for the erection of the George Chase Christian Memorial Cancer Hospital. In the same year a site valued at \$100,000 was given for the Minnesota Hospital and Home for Crippled Children by William H. Eustis, as the first installment of a gift for buildings and grounds for the univer-

sity, which will eventually amount to \$1,000,000; pledges to the amount of approximately \$2,000,000 were made by alumni and friends for the erection of an athletic stadium and an auditorium; and two loan funds, one of \$5000 and one of \$12,000, were established in the names of Edward M. and Effie R. Johnson. George Edgar Vincent was president of the university until he resigned in 1916 to accept the presidency of the Rockefeller Foundation, when he was succeeded by Marion LeRoy Burton, who resigned in 1920 to become president of the University of Michigan. President, Lotus Delta Coffman.

**MINNICK, JOHN HARRISON** (1877- ). An American educator, born at Somerset, Ind., and educated at Indiana, Illinois, Chicago, and other universities. For several years he taught in high schools in Indiana and Illinois, and from 1911 to 1913 he was critic teacher of mathematics at Indiana University. For two years following he was instructor in mathematics at the Horace Mann School at New York City. In 1916 he became instructor of mathematics at the University of Pennsylvania and was successively assistant professor of education, professor of education, and dean of the school of education at that university. He was a member of many learned societies, wrote *An Investigation of Abilities Fundamental to Geometry* (1918), and developed standardized tests in geometry.

**MINNIGERODE, MEADE** (1887- ). An American writer, born in London. He graduated from Yale in 1910 and for several years was associated with publishers in New York. He represented the United States Shipping Board in France in 1917-18 and in the year following was first lieutenant with the American Red Cross. His books include *Laughing House* (1920); *The Big Year* (1921); *O, Susanna* (1922); and *The Fabulous Forties* (1924), a graphic and amusing picture of New York in the time of Dickens.

**MIOMANDRE, FRANCIS DE** (1880- ). A French novelist, born at Tours, and educated at Marseilles. He began writing in his early twenties and won the Prix Goncourt in 1908 for his novel, *Écrit sur de l'Eau*. His novels are highly imaginative and put together with the genuine talent of a romancer who has traveled far and wide at his own study table. His works include: *Du Vent et de la Poussière*; *L'Ingénu*; *L'Aventure de Thérèse Beauchamps*; *Le Veau d'Or et la Vache Enragée*; *Les Taupes*; *Ces Petits Messieurs*; *Les Jeux de l'Amour et de la Danse*; *La Cabane d'Amour*; *Journal Interrompu*; *Pavillon du Mandarin*.

**MIQUELON.** See ST. PIERRE AND MIQUELON.

**MISSISSIPPI.** Mississippi is the thirty-first State in size (46,865 square miles), and the twenty-third in population; capital, Jackson. The population decreased from 1,797,114 in 1910 to 1,790,618 in 1920, a loss of 0.4 per cent. The white population rose from 786,111 to 853,962, but was still greatly exceeded by the negro population, in spite of the fact that the number of negroes decreased from 1,009,487 to 935,184 during the decade. The native white population increased from 776,722 to 845,943, while the foreign-born white decreased from 9389 to 8019. The urban population of the State mounted, from 207,311 to 240,121; the rural population, on the other hand, decreased from 1,589,803 to 1,550,497. The growth of

Meridian was from 23,285 in 1910 to 23,399 in 1920; Jackson, 21,262 to 22,817. Vicksburg, with 20,814 in 1910 and 18,072 in 1920, showed a decrease.

**Agriculture.** As the raising of cotton is one of the chief agricultural industries of the State, conditions during the decade 1910-20 were greatly affected by the ravages of the boll weevil, which occupied most of the State by 1909 or 1910. This is indicated by a comparison of the acreage and production of various years during the period: in 1913, 3,067,000 acres, 1,311,000 bales; 1915, 2,735,000, with 954,000 bales; 1917, 2,788,000, with 905,000 bales; 1921, 2,628,000, with 813,000 bales; 1922, 3,078,000, with 989,000 bales. During 1923 more than usual damage was done to the cotton plant, and the abandonment of cotton farming was much heavier than usual; the forecast for production was 752,000 bales. For a more detailed account of the ravages of the boll weevil in the cotton growing States, see *BOLL WEEVIL*.

While the population of the State decreased 0.4 per cent in the decade, the number of farms decreased 0.8 per cent (from 274,382 in 1910 to 272,101 in 1920). The area of land in farms decreased 1.9 per cent, from 18,557,533 to 18,196,979 acres; and while the improved land in farms increased from 9,008,310 acres to 9,325,677, the total percentage of land used for agricultural purposes decreased from 62.5 to 61.3. The total value of farm property showed an apparent increase of from \$426,314,634 in 1910 to \$964,751,855 in 1920; the average value per farm, from \$1554 to \$3546. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 272,101 farms in 1920, 91,310 were operated by owners, 989 by managers, and 179,802 by tenants. The comparative figures for 1910 were 92,066, 825, and 181,491. White farmers in 1920 numbered 110,882, compared with 109,645 in 1910, colored, 161,219, compared with 164,737. There was a decrease in negro population, 1910-20, of 7.4 per cent, compared with an increase of more than 11 per cent in the preceding decade, which quite seriously affected the farm labor situation. Farms free from mortgage in 1920 numbered 91,310; 92,066 in 1910. In 1920, 23,990 were mortgaged, compared with 29,693 in 1910. The number of dairy cows in 1920 was 530,274, compared with 429,587 in 1910; "beef cows," 261,682, compared with 138,930; hogs, 1,373,311, compared with 1,292,119; mules, 308,216, compared with 253,866; sheep, 164,440, compared with 156,230. The estimated production of the chief farm crops in 1920 was as follows: corn, 38,137,000 bushels; oats, 2,581,000; potatoes, 1,144,000; sweet potatoes, 9,094,000; hay, 548,000 tons; peanuts, 10,744,000 bushels. For cotton, see above. Comparative figures for 1913 are: corn, 63,000,000 bushels; oats, 2,800,000; potatoes, 960,000; and hay, 293,000 tons.

**Manufactures.** Although Mississippi is not one of the leading industrial States, it has many important industries. See *UNITED STATES, Manufactures*.

**Education.** Mississippi has educational problems of great difficulty. The colored popu-

lation exceeds the white, and in addition to this the rural localities are many of them thinly populated, and widely separated. In the decade 1914-24, notable advances were made. There was put into operation a splendid system of consolidated schools, which in 1923 numbered 751; and a compulsory school law was put into force, which brought into the schools during the first year of its operation over 33,000 white boys and girls over 7 years of age who had never before attended school. An equalizing school fund was provided, of more than \$1,125,000, to be disbursed by the State Board of Education for the benefit of the poorer sections of the State. The State Normal School, established in 1912, was enlarged, and had at the close of this period an enrollment of approximately 1500. The trustees of the schools of every county had been organized for several years in the County Trustees' Association, and the 82 county superintendents of the State were organized into a State association. In the latter part of the period the work of rehabilitation of cripples and vocational education had been organized and was producing excellent results. The high school work in over 1000 schools doing from 1 to 4 years of high school work had been standardized. There were 237 four-year accredited high schools, and hundreds of others doing from 1 to 3 years of accredited work. Enrolled in the colleges of the State in 1923 were as many students as were contained in the high schools in 1913; during the preceding two years a \$5,000,000 bond issue was expended in repairing and expanding the State colleges and institutions. The white enrollment in the high schools in 1923 was 28,000; in the colored high schools, 4000. The total public school enrollment was placed around 550,000, as compared with 469,137 in 1909-10. The percentage of illiteracy in the State decreased from 26.8 in 1910 to 20.8 in 1920; among the native white population, from 6.2 to 4.4 per cent; among the foreign-born white, from 13.6 to 13.4; among the negro, from 43.2 to 35.9.

**Finance.** For finances, see *STATE FINANCES*.

**Political and Other Events.** Mississippi remained steadfastly Democratic in the decade 1914-24. In 1916 Senator Williams was reelected, practically without opposition. In the presidential election of this year, President Wilson received 80,422 votes; Charles E. Hughes, 4253 votes. At this election an amendment was adopted increasing the number of Supreme Court judges to six, to be elected by the people for a term of eight years. Elections were held in 1917 for United States Senator. Former Senator Vardaman contested the nomination of Representative Harrison, who was nominated and elected. Senator Vardaman was opposed by President Wilson, who declared that the election of Vardaman would be a condemnation of the Wilson administration. In 1919, Lee M. Russell was reelected governor. In 1922 elections were held for United States Senator, and Hubert Stephens defeated former Senator Vardaman for the nomination. In elections held in 1923, Henry L. Whitfield was elected governor for the term 1924-28. On Feb. 18, 1920, the Legislature rejected the woman suffrage amendment.

**MISSISSIPPI, UNIVERSITY OF.** A coeducational State institution at University, Miss., founded in 1848. With the usual exception of the war years the university grew steadily dur-

ing the decade 1914-24, with an enrollment at the beginning of that period of 528, a faculty of 35, and a library of 25,000 volumes, as compared with an enrollment of 801, a faculty of 46, and a library of 35,000 volumes at the close. The income of the university also increased, from \$138,226 to \$167,000; five new dormitories and a pharmacy building were constructed, and a School of Commerce and Business and a department of hygiene were opened. Chancellor, Joseph Neely Powers, LL.D.

**MISSOURI.** Missouri is the eighteenth State in size (69,420 square miles), and the ninth in population; capital, Jefferson City. The population increased from 3,293,335 in 1910 to 3,404,055 in 1920, a gain of 3.4 per cent. The white population rose from 3,134,932 to 3,225,044; negro, from 157,452 to 178,241. The native white population showed an increase from 2,906,036 to 3,039,018, while the foreign-born white decreased from 228,896 to 186,026. The urban population mounted in the decade from 1,398,817 to 1,586,903; the rural population decreased from 1,894,518 to 1,817,152. The growth of the principal cities was as follows: St. Louis (q.v.), 1910, 687,029; 1920, 772,897; Kansas City (q.v.), 248,381 to 324,410; St. Joseph, 77,403 to 77,939; Springfield, 35,201 to 39,631.

**Agriculture.** As Missouri is one of the most important agricultural States, conditions in the decade 1914-24 reflected the fluctuation in prices and production which characterized the war and post-war periods. See AGRICULTURE.

Missouri is one of the minor cotton-producing States, and while the region where cotton is grown had lately become infested by the boll weevil, the insect was held back by the cold winters, and its ravages were not serious. Figures for area and production for several years are: 1913, 112,000 acres; production, 67,000 bales; 1916, 133,000 acres, 63,900 bales; 1920, 136,000, 79,000 bales. The production in 1922 was 149,000 bales; the estimated production for 1923, 198,000. It will be noted that since Missouri suffered less than most of the other affected States from the boll weevil, there was an increase in the area grown. In Missouri, in contrast with the situation in most of the other great agricultural states, the number of farms did not increase in proportion to the growth of the population in the decade. Whereas the population increased 3.4 per cent, the number of farms decreased 5.1 per cent (from 277,244 in 1910 to 263,004 in 1920). The total area in farms increased from 34,591,248 acres to 34,774,679, or 0.5 per cent; the improved land in farms, from 24,581,186 to 24,832,966 acres, or 1 per cent. The percentage of the total land used for agricultural purposes increased from 73.6 to 79.1 per cent; the proportion of improved land in farms, from 55.9 per cent to 56.5. The total value of farm property in the State showed an apparent increase from \$2,052,917,488 in 1910 to \$3,591,068,085 in 1920; the average value of farms, from \$7405 to \$13,654. In interpreting these values and indeed all comparative values for the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 263,004 farms in 1920, 185,030 were operated by owners, 2247 by managers, and 75,727 by tenants.

The comparative figures for 1910 were 192,285, 2001, and 82,958. White farmers in 1920 numbered 260,178, compared with 273,578 in 1910; colored, 2826, compared with 3666. Farms free from mortgage in 1920 numbered 82,099; under mortgage, 85,538. In 1910, 102,514 farms were free from mortgage; 88,486 were mortgaged. The total number of cattle in 1920 was 2,781,644 compared with 2,561,482 in 1910; dairy cattle numbered 1,066,750, compared with 856,430; hogs, 3,888,677 compared with 4,438,194; mules, 255,455 compared with 265,601; sheep, 1,271,616 compared with 1,811,268. The estimated production of the principal farm crops in 1923 was as follows: corn, 204,384,000 bushels; wheat, 37,947,000; oats, 32,382,000; barley, 114,000; potatoes, 8,788,000; hay, 4,038,000 tons; sweet potatoes, 1,501,000 bushels; and tobacco, 7,434,000 pounds. Comparative figures for 1913 are: corn, 129,062,000 bushels; wheat, 39,586,000; oats, 26,500,000; barley, 110,000; potatoes, 3,230,000; hay, 1,800,000 tons; and tobacco, 3,315,000 pounds.

**Mining.** Missouri is first among the States in production of lead. Important quantities of coal, clay products, and cement are also mined; but it is the lead industry which gives it its chief importance as a mineral producing State, with a rank of fifteenth in value of mineral products in 1921. Fluctuations in production of lead in the decade 1914-24 are indicated in the following figures: 1914, 192,612 short tons, valued at \$15,023,736; 1915, 210,440 short tons, \$19,781,360; 1916, 233,088, \$32,166,144; 1917, 234,156, \$40,274,832; 1918, 194,175, \$27,572,850; 1919, 163,290, \$17,308,740; 1920, 165,114, \$26,418,240; 1921, 180,085, \$16,207,650; 1922, 178,412, \$19,625,320. The greater part of the output is obtained from the southeast and central parts of the State. Coal production varied in the decade from 3,935,980 short tons in 1914 to 4,742,146 short tons in 1916; 5,667,730 in 1918; 5,369,565 in 1920; 3,551,621 in 1921; and 2,924,750 in 1922. Clay products during the decade ranged in value from \$6,077,284 in 1914 to \$7,640,995 in 1916; \$9,155,088 in 1918; \$17,474,542 in 1920; \$10,668,691 in 1921. The increased value in the latter years was due chiefly to changes in the buying power of currency which led to higher prices, since production was not greatly increased. The output of cement during the decade averaged about 5,000,000 barrels per year, but the value increased from \$4,485,744 in 1914 to \$8,034,540 in 1921, for a practically identical production, the increased value being due chiefly to the decreased buying power of money. The total value of the mineral products of the State for 1921 was \$56,375,543, compared with \$90,994,479 in 1920; \$61,862,232 in 1919; \$76,663,995 in 1918; and \$48,597,593 in 1914.

**Manufactures.** Missouri is an important industrial State. There are 13 cities with more than 10,000 inhabitants, containing 39.8 per cent of the total population of the State. In 1919 they reported 75.6 per cent of the value of the State's manufactured products. There were in the State, in 1909, 8375 establishments; in 1914, 8386, and in 1919, 8592. Persons engaged in manufacture numbered 185,705, 188,266, and 244,939, in those years, while the capital invested amounted to \$444,343,135, \$522,548,083, and \$938,760,773. The value of manufactured products in 1909 was \$574,111,070; in 1914, \$637,952,128; and in 1919, \$1,594,208,-

338. The large increase in value of the product in 1914-19 was due largely to changes in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the census period 1914-19; but the increase in number of wage earners indicates a decided growth in the manufacturing activities of the State. Slaughtering and meat packing is the first industry in point of value of products, which amounted in 1909 to \$79,581,000; 1914, \$92,060,000; and 1919, \$247,477,000. Flour and gristmill products rank second in value: in 1909, \$44,508,000; 1914, \$38,686,000; and 1919, \$113,297,000. The manufacture of boots and shoes is third, with a productive value of \$48,751,000 in 1909; 1914, \$52,522,000; and 1919, \$142,466,000. The manufacture of automobile bodies and parts, in fourth place, had an output in 1909 valued at \$1,677,000; 1914, \$2,183,000; and 1919, \$71,939,000. The most important manufacturing cities are St. Louis and Kansas City. In St. Louis, in 1909, there were 2667 manufacturing establishments, with a product of \$328,495,000; in 1914, 2787 with \$360,480,000; 1919, 3205 with \$871,700,000. Kansas City, in 1909, had 902 with \$54,705,000; in 1914, 1052 with \$60,953,000; and in 1919, 997 with \$192,815,000. St. Joseph is also an important manufacturing city, having, in 1909, 261 manufacturing establishments, with a product of \$17,626,000; 1914, 267 with \$17,068,000; and 1919, 219 with \$50,697,000.

**Education.** There was steady development in the educational system of Missouri during the decade 1914 to 1924. During that period a new plan of inspecting, supervising, and classifying high schools was formulated and put into operation. The State was divided into five districts coterminous with the five State teachers' college districts, in each of which a high school inspector or supervisor was placed, who had his office at the teachers' college and was responsible for the advancement of secondary education in his district. The department also undertook two other outstanding projects, a State-wide survey of educational conditions, and the reorganization of curriculum courses of study and standards for classification of high schools of the State. Trained experts were directing both activities. Attention was also given to the development of the rural schools, and there was at the end of the period one rural supervisor for the State and five rural school inspectors; the work of these supervisors was to help the county superintendents in group and community meetings, to inspect rural schools, and in general to help teachers in their work. The plan calls for a conference of teachers, school board members, and patrons at the close of the administration work; at this meeting plans for school improvement, better supervision, and improved presentation of the work, together with the individual problems of teachers, were to be discussed and remedies suggested. The total enrollment in the elementary and high schools in 1913 was 690,484; in 1923 it was 736,592. In the latter year, the white males numbered 353,301, and the white females, 349,183; the colored males, 16,174; and the colored females, 17,864. The total expenditure for educational purposes in 1923 was \$40,499,939. The percentage of illiteracy in the State decreased from 5.4 in 1910 to 3.8 in 1920; in the native white population, from 4.3 per cent to

2.8; in the foreign-born white, from 10.2 to 10; in the colored, from 21.1 to 14.3.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** While Missouri was regarded as a solidly Democratic State for many years, it has been gradually shifting to the doubtful class. It was carried by Roosevelt and the entire Republican State ticket except governor in 1904, by Herbert S. Hadley for governor in 1908, and by the Republicans again in 1910. During the decade 1914-24, following the Republican split of 1912, the Republicans in the latter part of the period developed sufficient strength to elect candidates for governor and United States senator. At elections held in 1914 for United States senator and for representative in Congress, William J. Stone was elected to the Senate, and the Democrats elected the Representatives in all the districts except two. A proposed prohibition amendment to the constitution was defeated at this election. In 1916 elections were held for governor and other State officers. The Democratic nominee for governor, Frederick O. Gardner, was elected; the Democrats elected all the State officers except the State auditor. In the presidential election of that year, President Wilson received 398,032 votes; Charles E. Hughes, 369,339. A constitutional amendment providing for State-wide prohibition was defeated at this election, but an amendment providing for pensions for the blind was carried. Senator W. J. Stone died in 1918, and X. P. Wilkey was appointed by Governor Gardner to serve until the election of a successor. The Republicans elected their candidate for senator, Selden P. Spencer, who defeated the Democratic candidate, Joseph W. Folk.

In 1919, the last year of Governor Gardner's administration, he appointed Lieutenant-Governor Wallace Crossley as State Fuel Commissioner acting in conjunction with the Federal fuel authorities, to conserve and distribute properly the coal supply when a shortage was threatened by labor trouble in the mines. The Republicans in 1920 elected their candidate for governor, Arthur M. Hyde, and reelected Senator Spencer. In the presidential election of that year, Warren G. Harding received 727,162 votes; James M. Cox, 574,799. At a referendum vote at this election, the people approved the enforcement of prohibition throughout the State. In 1922 the most important political happening was the election of a United States senator. Senator James A. Reed was a candidate for reelection. He was opposed for the nomination by Breckinridge Long. Senator Reed, although he was bitterly assailed for his failure to support President Wilson in the Senate, and although the former President strongly voiced his objection to his reelection, was successful at the primaries and was nominated. In the election in November he defeated the Republican candidate, R. R. Brewster. On May 10, 1922, more than 2500 citizens of Missouri petitioned Congress to modify the Volstead Act by restoring light wines and beer. During 1923, at St. Joseph a trial of 76 so-called radicals, including William Z. Foster and others, was conducted. Foster was acquitted, but several others were convicted.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 were as follows: The Legislature of 1915 enacted a measure designed to prevent dishonest advertising.

This prohibits misstatements of facts in any form of advertising matter. In 1917 the Legislature amended the laws relating to criminal procedure and abolished capital punishment, which was restored in 1919 at an extra session. Provisions were made for the voting of citizens absent on military service. An income tax was created and corporation, inheritance, and secured debt tax laws were passed. The secured debt law was declared unconstitutional. The banking laws were also amended in important details. By a provision of the Legislature in 1919, women were permitted to vote for president. The Legislature enacted a child labor law and a workmen's compensation law, the latter annulled by referendum. On January 6 the Legislature ratified the Federal prohibition amendment, and on July 3, in extra session, the Federal woman suffrage amendment. The Legislature of 1921 created a Commissioner of Agriculture; passed measures for the relief of the deserving blind; created a State Department of the Budget and social welfare boards in cities of the second and third class; amended the child labor laws, and created a municipal cooperative court in all counties having a population between 19,000 and 150,000. The law creating a Commissioner of Agriculture and Department of the Budget were later suspended by referendum and defeated.

The Legislature created a State Highway Commission in 1921 and provided for the construction of 7600 miles of hard-surface roads from a bond issue of \$60,000,000 voted by the people, supplemented by Federal aid. Much of this mileage was already under contract in 1924. The issuance of \$15,000,000 in bonds was authorized for the payment of a soldiers' bonus. The Legislature also created a State Department of Finance and passed a resolution to submit to the voters an amendment enabling women to hold any office in the State. This Legislature also provided for a system of workmen's compensation. This was suspended by referendum. In 1923 the Legislature passed a general prohibition act, enacted measures proposing to extend the voting privilege equally to men and women, submitted a proposed amendment for two additional judges on the Supreme Court bench, and passed a measure to facilitate the cooperative marketing of agricultural products. See CITY PLANNING.

**MISSOURI, UNIVERSITY OF.** A coeducational State institution at Columbia and Rolla, founded in 1839. The student enrollment increased from 2605 in 1914 to 3604 in the year 1923-24, with 1163 enrolled in the summer of 1923, and the faculty increased from 262 to 315 members. The library was increased from 165,000 to 271,000 volumes, the productive funds from \$1,280,000 to \$2,500,000, and the income from \$1,100,000 to \$2,600,000. A new building for the School of Journalism was given by Ward A. Neff in 1920, and a hospital, a gymnasium for women, a chemistry building, an agricultural building, and a War memorial building were erected in 1922. In 1921, \$50,000 was received for a home economics building, in 1922 in memory of their son, Lee H. Tate, and Mr. and Mrs. Frank R. Tate gave \$50,000 toward a law building; in 1923 they gave \$75,000. Albert Ross Hill, LL.D., was president until 1921; John Carleton Jones was acting president from 1921 to 1923, when he was succeeded by Stratton Duluth Brooks, LL.D.

**MITCHELL, WILLIAM** (1879- ). An American army officer, born at Nice, France, and educated at George Washington University and the Army Staff College. He was with Gen. Fitzhugh Lee in Cuba and served in the Philippines in 1899. In 1903 he constructed the Alaskan telegraph system and in 1914 joined the French aviation forces in France. He was the first American officer to fly over the lines, commanded the air units of the 1st Army, and was chief of the Air Service in the Argonne offensive. He commanded the air forces at St. Mihiel and served at Cambrai, the Somme, etc. He wrote *Our Air Force* and many pamphlets and magazine articles. In 1920 he was appointed brigadier-general in the Air Service.

**MOBILIZATION.** See ARMIES AND ARMY ORGANIZATION.

**MOFFAT TUNNEL.** See TUNNELS.

**MOHAMMED VI (VAHID-ED-DIN)** (1861- ). A sultan of Turkey, brother of Mohammed V, whom he succeeded in 1918. He lived in seclusion until he became sultan and was suspected of having French sympathies. After the rise of the Nationalist movement under Mustafa Kemal Pasha, the sultan was merely a figurehead politically, although as caliph he was the supreme religious authority of the entire Moslem world. In November, 1922, he was de-throned and left Constantinople on board the British warship *Malaya*, bound for Malta.

**MOHLER, JOHN ROBBINS** (1875- ). An American pathologist, born at Philadelphia, Pa., and educated at Temple University, the University of Pennsylvania, and Marquette University. For several years he was a practicing veterinarian and was also in the employ of the Bureau of Animal Industry of the Department of Agriculture. In 1891 he was appointed assistant pathologist in the Bureau and was successively zoölogist, chief of the pathological division, assistant chief, and from 1917, chief of the entire Bureau. Besides translating several medical works from foreign languages, he was the author of many articles on pathology, bacteriology, and meat inspection. During the War he was a member of the Remount Board of the United States Army.

**MOLDAVIA.** See RUMANIA.

**MOLEY, RAYMOND** (1886- ). An American educator, born at Berea, Ohio, and educated at Baldwin-Wallace College, Oberlin College, and Columbia University. He taught in several schools in Ohio until 1914. In 1916 he was appointed instructor and assistant professor of politics at Western Reserve University and from 1919 was director of the Cleveland Foundation. In 1918-19 he was also director of Americanization work under the Ohio State Council of Defense. He wrote *Lessons in Democracy* (1919); *Commercial Recreation* (1919); *Facts for Future Citizens* (1922); and various pamphlets and articles on the teaching of government.

**MÖLLER VAN DEN BRUCK, ARTUR** (1876- ). A German writer, born at Solingen. He was educated and spent several years traveling in Germany, Austria, France, Italy, England, Scandinavia, and Russia. Besides editing the works of Dostoyevsky, he is the author of *Die Moderne Literatur in Gruppen und Einzeldarstellungen* (1900); *Die Variété: eine Kultur-dramaturgie* (1901); *Die Deutschen: Unsere Menschheitsgeschichte* (1904); *Zeitgenos-*

sen (1905); *Die Italienische Schönheit* (1913); *Der Preussische Stil* (1915); and *Das Recht der Jungen Völker* (1918).

**MOLNAR, FRANZ** ( ?- ). A Hungarian playwright. He is the author of *Liliom*, which, played in New York City in 1922, presents a penetrating study of characteristic tendencies in a roughneck, and author also of *Launzi* which was unsuccessful in New York in 1923. His *Passions for Men* was seen in New York in 1923, and in the same year Eva Le Gallienne was starred in *The Swan*, a high comedy with a deft satirical thrust (1923).

**MOLTKE, RAIMUND HERMANN SIEGFRIED** (1869- ). A German writer and economist. He studied in Leipzig and at the Art Academy in Berlin and later became librarian of the Chamber of Commerce of Leipzig. He is the author of *Verse* (1895); *Aus Meiner Skizzenmappe* (1897); *Der Heilige Karl*, a play (1903); *Die Feder Geschärft* (1914); *Gott im Leide* (1915); *Kreuzwege des Lebens* (1916), and *Um die Mark Main* (1919). His most important works, on economic and historical subjects, are *Leipzigs Handelskorporationem* (1907); *Zwei Kapitel aus Leipzigs Handels- und Verkehrsgeschichte* (1912); *Friedrich List* (1913); *Katalog Altkaufmännischer Archive in Leipzig* (1913); *Die Deutsche Eisenbahn im Kriege* (1916); *Die Leipziger Messe im Kriege* (1917); and the biography, *Bernhard von Tauchnitz* (1916).

**MOLUCCA.** See DUTCH EAST INDIES.

**MOMBERT, ALFRED** (1872- ). A German poet, born in Karlsruhe, and educated at the universities of Heidelberg, Leipzig, Munich, and Berlin. He practiced law for six years and then devoted himself to his literary work. His works include: *Der Sonnengeist* (1905); *Aeon, der Weltgesuchte* (1907); *Aeon vor Syrakus* (1911); *Der Himmlische Zecher* (1909); *Der Held der Erde* (1919); and *Aeon Zwischen den Frauen* (1920).

**MONASTIR.** See WAR IN EUROPE, Balkan Front.

**MONDELL, FRANK WHEELER** (1860- ). An American public official, born in St. Louis, Mo., and educated in the public schools. For many years he was engaged in farming, stock-raising, and railroad construction. In 1887 he settled in Wyoming, where he took an active part in the development of the State. In 1909 he was elected a member of the first State Senate and from 1897 to 1899 was assistant commissioner of the Land Office. He was elected to Congress in 1895 and was successively reelected until 1922, when he was defeated. In the 66th and 67th Congresses he was majority leader on the floor of the House and took a prominent part in framing the legislation passed by that body. He took an active part in all the Republican conventions from 1902 to 1924, inclusive.

**MONET, CLAUDE** (1840- ). A French landscape painter (see VOL. XVI). During recent years Monet has continued to hold his rank as the foremost landscape painter of impressionism. For two years after the beginning of the War, he ceased painting, but during the third year he built a larger studio and completed, up to the time of the Armistice, about 14 large paintings, arranged in groups of three to five. The subjects were chiefly water-lilies,

and he presented his fine blue diptych on this subject to the French nation in honor of the Armistice. Exhibitions of his works were recently held in Paris and New York (1923).

**MONGOLIA.** A Chinese outer territory, with an estimated area of 1,367,900 square miles, and a population of about 2,500,000. The difficulties of communication because of lack of railways and the obstacles presented by the barren reaches of the Desert of Gobi, which cuts into the heart of the region, made for a sparsely settled population. Agriculture was impossible, with the result that the inhabitants were hunters and raisers of camels, horses, and sheep. In the period 1914-24 the Chinese were steadily penetrating into Inner Mongolia and the Desert of Gobi and beginning to apply themselves to the tillage of the soil. Inner and Outer Mongolia were joined in 1917 by a motor transport service plying between Urga and Kalgan. Urga was the chief town and centre of population. During the decade 1914-24 Mongolia's fortunes were linked with those of Russia and China. Up to the Revolution, Russian penetration into Outer Mongolia continued; a loan arranged in 1913 was financed on the security of internal revenues; a bank was established with a Russian directorate; in 1914 a scheme was projected for the financing and construction of Mongolian railways. The overthrow of the Czar not only checked the completion of these enterprises but also put Outer Mongolia at the mercy of marauding bands. Fear of Bolshevik incursions, as well as the threat of Semenov's forces operating near the border, impelled the autonomous government of Outer Mongolia to appeal to China for aid. In November, 1919, the reigning prince, the Living Buddha or Hutuktu, prompted by his advisers, asked for the cancellation of the charter of independence; some days later the Chinese government acceded by denouncing the Russo-Chinese and Russo-Mongolian treaties of 1913-14. The Chinese did not maintain their position long. Early in 1921, Baron Ungern von Sternberg, heading remnants of Semenov's anti-Bolshevik troops, marched on the Chinese at Urga, captured the town, and put the garrison to the sword. The Hutuktu was compelled to announce his sovereignty once more, though his policies were plainly dominated by the Baron Ungern. The Peking government was defied, and troops were even sent into Inner Mongolia. Ungern could not stand up against the Bolshevik army of the Far Eastern Republic and in a series of engagements his troops were defeated and he himself captured. He was executed on Sept. 15, 1921. Russian influence again became paramount. Soviet troops remained at Urga; a Mongolian national government, taking control, adopted a consistently friendly attitude toward Soviet Russia. In 1923 a Russian mission proceeded to Peking for the purpose of restoring friendly relations and reestablishing the economic agreements of 1913-14. In June, 1924, a treaty was signed which called for the restoration of Mongolia to China. Inner Mongolia, during the period, continued to be administered by Chinese officials appointed through Peking. See CHINA; RUSSIA.

**MONITOR.** See VESSEL, NAVAL.

**MONTAGU, EDWIN SAMUEL** (1879- ). An English public official, author of the so-called

Montagu Plan (see INDIA). He was educated at Trinity College, Cambridge, and from 1906 to 1908 was Parliamentary Secretary to the Chancellor of the Exchequer. He was secretary to the Prime Minister from 1908 to 1910; from that year to 1914, Parliamentary Under-Secretary of State for India. He served as chancellor of the Duchy of Lancaster in 1915 and as Financial Secretary of the Treasury from 1914 to 1916. He was Minister of Munitions and a member of the War Committee in the latter year and Secretary of State for India from 1917 to 1922. From 1906 he was a member of Parliament from Cambridgeshire. He was made a member of the Privy Council in 1914.

**MONTAGUE, WILLIAM PEPPERELL** (1873-). An American professor of philosophy, born at Chelsea, Mass., and educated at Harvard University. In 1903 he became a member of the faculty of Columbia University, when he was appointed full professor in 1920. One of the six authors of the Neo-Realist programme, he has written numerous essays on the reduction of consciousness to a form of energy and on the implications of realistic philosophy in the realm of what are ordinarily called spiritual values.

**MONTANA.** Montana is the third State in size (146,997 square miles) and the thirty-ninth in population; capital, Helena. The population increased from 376,053 in 1910 to 548,889 in 1920, a gain of 46 per cent. The white population increased from 360,580 to 534,260; the Indian population from 10,745 to 10,956. There were, in 1910, 1585 Japanese, and in 1920, 1074; the negro population also decreased, from 1834 to 1658. The native-born white population increased from 286,936 to 440,640; the foreign-born white, from 91,644 to 93,620. Both urban and rural populations mounted during the decade, the former from 133,420 to 172,011, and the latter from 242,633 to 376,878. The growth of the principal cities was as follows: Butte, 1910, 39,165; 1920, 41,611; Great Falls, 13,943 to 24,121; Billings, 10,031 to 15,100.

**Agriculture.** While the population of the State increased 46 per cent in the decade, the number of farms increased 120 per cent (from 26,214 in 1910 to 57,677 in 1920), and the total acreage in farms increased to 35,070,656 from 13,545,603, a gain of 158.9 per cent. The improved land in farms increased also, from 3,640,309 to 11,007,278 acres. The percentage of land used for agricultural purposes in 1910 was 14.5; in 1920, 37.5. The total value of farm property showed an apparent increase from \$347,828,770 in 1910 to \$985,961,308 in 1920, or 183.5 per cent; the average value per farm, from \$13,269 to \$17,095. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 57,677 farms in 1920, 50,271 were operated by owners, 899 by managers, and 6507 by tenants. The comparative figures for 1910 were 23,365, 505, and 2344. White farmers in 1910 numbered 25,018; in 1920, 56,614, of whom 41,051 were native and 15,563 foreign-born. Of the 1063 colored farmers in 1920, 987 were Indians. Farms free from mortgage in 1920 numbered 16,365, compared with 18,014 in 1910; those under mortgage, 29,897 compared

with 4820. The number of dairy cows increased to 153,425 in 1920 from 77,527 in 1910; "beef cows," from 372,798 to 514,853; while sheep decreased in number from 4,959,835 to 2,082,919. The area under irrigation increased from 1,679,084 acres in 1909 to 1,681,729 acres in 1919. The estimated production of the chief farm crops in 1923 was as follows: corn, 9,016,000 bushels; spring wheat, 44,764,000; winter wheat, 12,546,000; oats, 23,051,000; barley, 2,161,000; potatoes, 5,091,000; and hay, 1,940,000 tons. Comparative figures for 1913 are: corn, 882,000 bushels; wheat, 20,673,000; oats, 21,750,000; barley, 1,860,000; potatoes, 5,040,000; and hay, 1,188,000 tons.

**Mining.** Montana is an important State in the production of minerals. In former years gold, silver, and copper were the most valuable products of the mines; latterly they were surpassed by coal. The progress of the mining industry, 1914-19, is indicated by comparative figures. The production of coal in 1914 was 2,805,173 short tons, valued at \$4,913,191; 1915, 2,789,755 short tons, \$4,526,509; 1917, 4,226,689, \$8,919,136; 1918, 4,532,505, \$11,444,875; 1920, 4,413,866, \$13,923,000; 1921, 2,733,958, \$8,921,600; and 1922, 2,572,221 short tons. The production of silver varied from 12,016,460 fine ounces in 1914 to 16,494,366 in 1916; 16,797,479 in 1918; 12,579,178 in 1920; and 12,468,151 in 1922. In production of copper, Montana ranks second among the States; it is surpassed only by Arizona. In 1914 the copper output was 233,229,640 pounds; 1916, 352,928,373; 1918, 323,174,850; 1920, 177,059,260; 1921, 48,098,730; and 1922, 165,754,442. The diminished production in 1921 was due chiefly to business depression which diminished the demand for copper. Comparative figures for gold, lead, and zinc are as follows: 1914, gold, \$4,117,911; lead, 9,656,008 pounds; zinc, 111,580,544; 1916, gold, \$4,550,494; lead, 13,595,136 pounds; zinc, 229,259,075; 1918, gold, \$3,104,764; lead, 37,135,875 pounds; zinc, 209,258,148; 1921, gold, \$1,480,763; lead, 20,366,917 pounds; zinc, 23,275,966; 1922, gold, \$1,656,757; lead, 29,767,479 pounds; zinc, 11,069,818. A considerable amount of petroleum is also produced in the State, the output increasing from 340,000 barrels in 1920 to 1,509,000 barrels in 1921, and 2,449,000 barrels in 1922. In addition to the minerals noted above, quantities of graphite, iron ore, and stone are also produced. The total value of the mineral production in 1921 was \$30,161,734, compared with \$85,885,403 in 1920; \$73,630,824 in 1919; \$139,331,507 in 1918; and \$54,244,899 in 1914.

**Manufactures.** Montana is not one of the important manufacturing States. See UNITED STATES, *Manufactures*.

**Education.** Montana has been one of the most efficient States in the conduct of its educational system; the Russell Sage Foundation in 1920 placed the Montana school system first among those of the United States. The public school fund, which was greatly increased during the decade 1913-23 by the sale of school lands and by grants of the State, amounted to more than \$20,000,000 and contributed an annual revenue, together with the amount received from leases of school lands, of more than \$1,000,000. The Legislature was liberal in the enactment of laws relating to schools. Development in vocational education was marked; the Smith-Hughes Law, providing Federal aid to

States, was accepted by the Legislature in 1917, and provisions were made for the cooperation of State and local boards of education in vocational training. The boards of trustees of the school districts of the States were authorized to establish and maintain Americanization schools for all mentally normal persons over the age of 16. One phase of the development is indicated by the increase in enrollment; in the public schools in 1914, 85,728 were enrolled; in 1922, 122,380 (elementary schools, 99,011). In the high schools of the State, in 1921-22, the enrollment was 18,514. The total disbursement for schools in 1922 was \$8,646,758. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 2.8 in 1920. In the native-born population it remained for both periods at 0.4 per cent; among the foreign-born white population it decreased from 9.2 per cent to 6; in the negro population it decreased from 12.6 to 8 per cent.

**Finance.** For finances, see STATE FINANCES.

**Political and Other Events.** The political control of Montana in the decade 1914-24 fluctuated between the Republican and Democratic parties, with the latter ahead for a larger portion of the time. An election held in 1914 for representative-at-large was carried by the Democrats. At this election a prohibition amendment was carried. On Sept. 6, 1914, Mayor Lewis J. Duncan of Butte was removed from office after trial in the district court for neglect of duty in connection with miners' strikes. The elections of 1916 were notable in that Jeannette Rankin was chosen the first woman member of the House of Representatives. The Democrats elected their candidate for governor, S. V. Stewart; Henry L. Myers, Democrat, was re-elected to the Senate. In the presidential voting, President Wilson received 101,063 votes; Charles E. Hughes, 66,750. In 1917 there were many industrial disturbances in the mines of the State, and on August 2 of that year, Frank Little, organizer and agitator of the Industrial Workers of the World, was lynched in Butte for attempts to organize a strike in the metal mines and for denouncing the army and the Federal government. The State was on the point of persecuting him for these utterances and attempts when he was seized at night and hanged. In the elections of 1918 Miss Rankin was defeated for reelection to the House of Representatives by Carl Riddick. Senator T. J. Walsh was re-elected to the Senate. The Republicans came into power in 1920 and elected Joseph M. Dixon governor, together with other State officers. In the presidential voting of this year, Warren G. Harding received 109,430 votes; James M. Cox, 57,372. In 1922 elections were held for United States Senator; Burton K. Wheeler, the Democratic candidate, was elected. In this election two constitutional amendments were adopted. One permitted the consolidation of city, county, and town governments; the other created a State Board of Equalization. The voters also approved a referendum measure of the soldiers' bonus. This was afterward declared unconstitutional by the Supreme Court, and the Assembly voted to submit to the people in 1924 the question of amending the constitution so as to permit the granting of such a bonus.

In 1924 both Senators from Montana were much in the public eye on account of their prominence in investigations held by the Senate.

Senator Walsh practically conducted the investigation into the alleged frauds and the leasing of oil reserves, while Senator Wheeler was responsible for and took a prominent part in the investigation of the administration of H. M. Daugherty, Attorney-General of the United States. Senator Wheeler was indicted in Montana for alleged infraction of the law which prohibits members of Congress from taking part in litigation in which the government is concerned. An investigation held by a Senate committee headed by Senator Borah exonerated Senator Wheeler.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1915 passed a measure providing for the submission of the question of prohibition to the people by referendum, to be voted for in 1916. This was carried. The Legislature of 1917 amended the laws relating to the administration of justice in the courts. It also authorized cities to adopt a commission form of government and amended the prohibition laws. On July 30, 1919, the Legislature ratified the woman suffrage amendment. At this session of the Legislature a law was passed providing for a State budget. In 1921 the Legislature revised the tax laws and imposed new taxes on the production of oil, gas, minerals, etc. In 1920 measures were passed preventing the holding of land by aliens. A measure was also enacted granting a modified old-age pension. Laws were passed putting into effect constitutional amendments passed in 1922.

**MONTANA, STATE UNIVERSITY OF.** A co-educational institution at Missoula, founded in 1895; a part of the University of Montana which comprises the State University at Missoula, the State College at Bozeman, the State Normal College at Dillon, and the State School of Mines at Butte. The student enrollment of the State University rose from 220 in 1910 to 1595 in the year 1922-23, with 515 in the summer of 1923. In 1923-24, the faculty had 84 members, the library contained 100,000 volumes, and the income was \$470,000. Six new buildings were completed in 1923, including a library, gymnasium, forestry building, two residence halls, and a central heating plant, bringing the total number of buildings to 20, and the investment in buildings, equipment, and grounds, to \$2,250,000. E. O. Sisson was president from 1917 to 1920 and was succeeded by Charles H. Clapp, Ph.D., in 1920.

**MONTEMEZZI, ITALO** (1875- ). An Italian composer, born at Verona. He received his musical education at the Conservatory of Milan. Next to Puccini he is the most talented of living Italian composers. In 1919 he visited the United States, conducting the American première of his opera *La Nave* (Chicago Opera Association, Nov. 18), which had its world première in Milan (1918). His other works include the operas, *Giovanni Gallurese* (Turin, 1905), *Hellera* (ib., 1909), *L'Amore dei Tre Rè* (Milan, 1913; New York, 1914), and *La Principessa Lontana* (not yet produced); and a cantata, *Il Cantico dei Cantici*.

**MONTENEGRO.** The history of this state during the War was obscure, both because of its military unimportance, and more largely, because of its doubtful loyalties. From 1914 to 1918 a division of sentiment ever widened the breach between the partisans of the ruling family and the growing group that looked to Serbia for

the fulfillment of racial and nationalistic aspirations. On Aug. 8, 1914, Montenegro declared war on Austria-Hungary. The fear on the part of King Nicholas and his sons that victory for the Allies would mean the submergence of their dynasty led in 1915 and 1916 to a series of intrigues with Austria whose purpose was interpreted by Slav patriots as an endeavor to erect a Slav state in the South, ruled by one of Nicholas's sons and virtually under Austrian domination. Montenegro was overrun by the Austrian army early in 1916; in the same year, having failed to gain over the Central Powers, Nicholas abandoned his country and retired to France. This absence strengthened the hand of the Slav nationalists. In 1917, Montenegrins met with Serbs, Croats, and Slovenes at Corfu, where the pact setting forth their common principles was issued. On Nov. 26, 1918, the stamp of popular approval was put on this declaration when a National Assembly repudiated the dynasty and declared the union of Montenegro with the other southern Slav peoples. The court party, supported by Italians who sought to drive a wedge into Slav unity by encouraging Montenegrin independence, maintained that the Assembly had been elected under unfair conditions, with Serbian troops occupying the country. The course of events made even these few opponents confess defeat; Nicholas died in March, 1921; the Crown Prince Danilo abdicated in favor of a young nephew; France and England withdrew diplomatic recognition. When, in 1921, it was evident that Montenegrin delegates to the Jugo-Slav Constituent Assembly were unalterably in favor of union, it became clear that the history of Montenegro as an independent state was closed. See JUGO-SLAVIA, *History*.

**MONTEUX, PIERRE** (1875- ). A French conductor, born in Paris. He studied at the Paris Conservatoire under Berthelier (violin; first prize), Lavignac (harmony), and Lenepveu (fugue). For some years he played the viola, first in Colonne's orchestra, then at the Opéra Comique, and during this period appeared with various ensemble organizations. In 1904 he began his career as conductor with the Concerts Monteux in Paris, at which he produced chiefly new works of impressionist composers. In 1911 he became conductor for Diaghilev's Ballet Russe in Paris and subsequently made four European tours with that organization, with which he also came to the United States in 1916. During the summer of 1917 he gave a series of concerts with the Civic Orchestra in New York, and from 1917 to 1919 he was conductor of the French operas at the Metropolitan Opera House. From 1919 to 1924 he was conductor of the Boston Symphony Orchestra. When he assumed the leadership, the once famous orchestra was almost completely demoralized (see MUSIC, *Orchestras*), but he succeeded in bringing the organization back to its former high level of excellence.

**MONFORT, EUGÈNE** (1877- ). A French novelist. He was the editor of the literary review, *Les Marges*. In his novels he showed a predilection for the sea, particularly for the picturesque Mediterranean and the port of Marseilles. In several of his novels he showed himself a master of description and psychological analysis. His works include: *Les Cœurs Malades* (1904); *Le Chalet dans la Montagne* (1905); *La Maîtresse Américaine* (1906); *La Turquie* (1912); *Les Noces Folles*

(1913); *La Belle Enfant, ou l'Amour à Quarante Ans*; *Mon Brigadier Triboulère* (1918); *Un Cœur Vierge* (1920); *La Soirée Perdue* (1921); *Brelan Marin* (1922).

**MONTGOMERY, ROBERT HIESTER** (1872- ). An American lawyer and accountant, born at Mahanoy City, Pa., and educated in the public schools. For many years he was an accountant in New York City. In 1902 he was admitted to the bar. He served as instructor in economics and assistant professor of law at Columbia University from 1912 to 1919, and in the latter year he was appointed professor of accounting there. He served in the Spanish-American War, and during the War in Europe he was attached to the General Staff in Washington. He also served on the War Industries Board and in several other important capacities. He was a member of many legal and economic societies and author of *Income Tax Procedure* (1917-22); *Excess Profits Tax Procedure* (1920); and *Auditing Theory and Practice* (1921).

**MOON, PARKER THOMAS** (1892- ). An American educator, born in New York City, and educated at Columbia University. In 1913-14 he was William Mitchell fellow at Columbia and was Gilder fellow in 1914-15. In the latter year he was appointed instructor in history, and in 1919 assistant professor, at Columbia. In 1921 he became managing editor of the *Political Science Quarterly*. He was a member of the staff of the American Commission to Negotiate Peace in 1918-19. He is a member of several economic societies, and author of *A Syllabus of Imperialism and World Politics* (1919); and *The Labor Problem and the Social Catholic Movement in France* (1921). He also contributed to periodicals and year books.

**MOORE, CLARENCE LEMUEL ELISHA** (1876- ). An American mathematician born in Ross County, Ohio, and educated at Ohio University and Cornell. He was assistant in mathematics at Ohio and held a similar appointment at Cornell. In 1904 he was called to the Massachusetts Institute of Technology, where in 1920 he became professor. Among the subjects in which he has made special investigations are geometry of the sphere, geometry of the circle in space, and the differential geometry of hyperspace.

**MOORE, GEORGE EDWARD** (1873- ). A British philosopher. He was educated at Trinity College at Cambridge and was appointed Lecturer on Moral Science at that university in 1911. He became one of the leaders of the realistic group of philosophers, constituted around the scientific researches of which Cambridge was the centre. His volume on *Principia Ethica* (1903) was an attempt to apply the method of scientific realism to the field of morality and value judgments, but the attempt was only partially successful. Among his other works are a popular exposition of ethical theory (*Ethics*, 1912) and a volume of collected *Philosophical Studies* (1922). In 1920 Professor Moore became the editor of the British philosophical periodical, *Mind*.

**MOORE, HARRY TUNIS** (1874- ). An American bishop, born at Delavan, Wis., and educated at Hobart College and the Western Theological Seminary. In the same year he was ordained priest in the Protestant Episcopal Church and served as rector in several cities of Nebraska, Texas, Illinois, and other States. He

was rector of St. Matthew's Cathedral in Dallas, Texas, 1907-17, and in the latter year was appointed coadjutor bishop of the Diocese of Dallas.

**MOORE, HENRY LUDWELL** (1869- ). An American economist, born in Charles County, Md. He studied at Randolph-Macon College, in Vienna, and at Johns Hopkins University, where during 1896-97 he was instructor of political economy. In 1897 he became professor of political economy at Smith College (Northampton, Mass.). From this position he resigned in 1902 to accept a similar chair at Columbia University. In addition to many articles on the statistical aspects of his specialty, he is the author of *Laus of Wages* (1911); *Economic Cycles, Their Law and Cause* (1914); and *Forecasting the Yield and Price of Cotton* (1917).

**MOORE, HENRY THOMAS** (1886- ). An American psychologist, born at Ansonville, N.C., and educated at Yale and Harvard Universities. He taught at Simmons College and after 1915 at Dartmouth. He is the author of *The Genetic Aspect of Consonance and Dissonance* (1914); *Pain and Pleasure* (1917); and *Modern Psychology for the Beginner* (1922).

**MOORE, HUGH KELSEA** (1872- ). An American chemist, born at Andover, Mass., and educated at the Massachusetts Institute of Technology. He began his professional work as a chemist with the Electro-Chemical Company in Rumford Falls, Me., in 1897. Three years later he became connected with the American Electrolytic Company and with the Burgess Sulphite Fibre Company (1903-10). On the consolidation of several sulphite paper pulp mills as the Brown Company, he became its chief chemical engineer. His original investigations were chiefly concerned with various processes in paper pulp making and its bleaching, on which he obtained many patents. He invented a continuous process for the hydrogenation of oils, and in 1897, the unsubmerged cathode cell. In recognition of "the best contributions to applied science since 1913" he received the gold medal of the American Institute of Chemical Engineers, of which he became a vice president. During the War he was a member of the Council of National Defense and also a member of the division of chemistry of the National Research Council. In addition to many chemical papers he is the author of *The Human Elements in the Mill* (1918) and *Why the Church Fails to Interest People Enough to Attend* (1918).

**MOORE, JOHN BASSETT** (1860- ). An American jurist and diplomat (see VOL. XVI). He served as delegate to the Pan-American Financial Congress in 1915 and was vice president of the International High Commissions organized by that conference. In 1921 he was appointed judge of the Permanent Court of International Justice. His later works on politics and diplomacy included *Principles of American Diplomacy* (1918).

**MOORE, JOHN MONROE** (1867- ). An American bishop, born at Morgantown, Ky., and educated at Lebanon College and Yale and in Germany. He was ordained as a preacher in the Methodist Episcopal Church and filled pastorates in St. Louis, San Antonio, and Dallas, Texas. For several years he was managing editor of *The Christian Advocate* and secretary of home missions of the Methodist Episcopal Church, South, from 1910 to 1918. In the lat-

ter year he was elected bishop and given charge of work in Brazil. He was a member of several important church societies and was the author of *Etchings of the East* (1909); *The South To-day* (1916); *Brazil—An Introductory Study* (1920), and *Essential Objectives in Missionary Endeavor* (1922).

**MOORE, RICHARD BISHOP** (1871- ). An American chemist, born at Cincinnati, Ohio, and educated in England and France and at Chicago University. He was instructor in chemistry at Missouri; and during 1905-11, professor of chemistry at Butler College; and thereafter physicist at the Bureau of Soils of the Department of Agriculture. In 1912 he became connected with the United States Bureau of Mines, whose chief chemist he became in 1919. His original investigations were largely concerned with the properties of rare gases in the atmosphere, and the metallurgy of rare metals, especially tungsten, uranium, and vanadium, and more recently the metallurgy of radium, on which he wrote valuable papers. He is the author of *A Laboratory Chemistry* (1904).

**MOORE, UNDERHILL** (1879- ). An American lawyer and educator, born in New York City, and educated at Columbia University. From 1892 until 1907 he practiced law in New York City. After service on the faculty of the Universities of Kansas and Wisconsin, he was appointed professor of law at Columbia University in 1916. He served in the Spanish-American War. He wrote several books on legal subjects and contributed to the *Columbia Law Review* and other law publications.

**MORAND, PAUL** (1888- ). A French novelist, born in Paris of a French father and a Russian mother, and educated at the Sorbonne. He entered the French diplomatic service and was attached to the embassies at London, Rome, and Madrid. As a man of letters he rose to prominence with his novels, *Ouvert la Nuit* and *Tendres Stocks*, descriptions of cosmopolitan Paris after the War. His other works include *Lampes à Arc*, *Feuilles de Température*, *Fermé la Nuit*, and *Lewis et Irène*.

**MORAVIA.** See CZECHO-SLOVAKIA.

**MORAVIAN CHURCH, THE** (UNITAS FRATRUM). This denomination, tracing its origin to the followers of John Huss and Jerome of Prague, was first organized in Bohemia in 1457. Its members found their way into Pennsylvania in 1740. Its two chief centres in the United States were Bethlehem, Pa., and Winston-Salem, N. C. The denomination had no formal statement of creed peculiar to itself; it is evangelical in belief, in harmony with other Protestants. One explanation of its smallness is that it refrained on principle from seeking proselytes at the expense of other Christian bodies. Its polity was a modified episcopacy; its ritual, liturgical. After the beginning of the War, the administration of the foreign missions was decentralized; the American branch of the church had special responsibility for those in Nicaragua and for the Eskimo and Indian work in Alaska and California. It also rendered aid during the 10 years to other missions of the Moravian Church in Labrador, the West Indies, Dutch Guiana, the Cape Province of South Africa, Tanganyika Territory, and among the Tibetan-speaking peoples of the Western Himalayas and the lepers of Jerusalem. It also supported a college and seminary at Bethlehem, Pa., and several board-

ing schools, throughout the period. In 1913 the communicant membership in the United States and Canada was 19,463; in 1923 it was 23,723. The number of churches increased from 122 to 128; the number of ministers, from 142 to 147. Of these, 33 were either released for temporary service elsewhere or were in partial or complete retirement on account of age or ill health, etc.

**MORESNET.** See EUPEN, MALMÉDY, AND MORESNET.

**MOREY, CHARLES RUFUS** (1877- ). An American educator and author, born at Hastings, Mich., and educated at the University of Michigan. From 1900 to 1903 he was a fellow of the American School at Rome. In 1903-04 he was a fellow at Princeton University, and in 1906 he became head of the Princeton summer school. He was appointed professor of art and archaeology there in 1918. A member of many learned societies, he was the author of *East Christian Paintings in the Freer Collection* (1914); *Lost Mosaics and Frescoes of Rome* (1915), and *Romanesque Sculpture* (1920).

**MORGAN, EDMUND MORRIS, JR.** (1878- ). An American jurist and educator, born at Mineral Range, Ohio, and educated at Harvard University. In 1905 he began practice in Duluth, Minn., remained there until his appointment as professor of law at the University of Minnesota in 1912. From 1917 he was professor of law at Yale University. He was several times city attorney of Duluth. In the War he served in the judge advocate-general's department with the rank of lieutenant-colonel. He was the author of *Introduction to the Study of Law* (1917) and *Cases of Common Law Pleading*.

**MORGAN, JOHN PIERPONT** (1867- ). An American financier (see VOL. XVI). He took a prominent part in the financial aspects of the War and following its outbreak made the first loan of \$12,000,000 to Russia. His firm was appointed commercial agent of the British government in the United States in 1915 and conducted purchases of all munitions and supplies in the United States. In the same year a loan was made of \$50,000,000 to the French government, and he organized a syndicate of about 2200 banks and floated a loan of \$500,000,000 to the Allies. After the War he was frequently called on to advise the American and foreign governments in financial matters and made several trips to Europe to investigate and report on financial conditions there.

**MORGENTHAU, HENRY** (1856- ). An American diplomat (see VOL. XVI). In 1913 he was appointed ambassador to Turkey and served until 1916. From 1914 he was also in charge of the interests of Great Britain, France, Italy, Russia, Serbia, and other countries in Turkey. In 1919 he was a member of the commission appointed by President Wilson to investigate conditions in Poland. He was appointed ambassador to Mexico in 1920, but owing to the severance of relations between the United States and that country, he did not serve. He was vice president of the Near East Relief from 1919 to 1921. He wrote *Ambassador Morgenthau's Story* (1918) and *All In a Lifetime* (1919). Decorations were conferred on him by various countries for his services during the War.

**MORINI, ERIKA** (1906- ). An Austrian violinist, born in Vienna. She received her first instruction from her father, who was the director of his own music school in Vienna, and

completed her studies under Otakar Sevcik. Hers is a case of remarkable precocity, for when she made her début in Berlin, under Nikisch, in 1917, the critics made no allowance for her youth, but spoke of her work as the equal of that of the most famous of the younger generation of violinists. Her American début at New York (Jan. 26, 1921) was one of the musical sensations of the year, and since then she has been heard in the United States every season, both in recital and with the foremost orchestras. She made her first visit to London in 1923.

**MORISON, SAMUEL ELIOT** (1887- ). An American historian, born in Boston, Mass., and educated at Harvard and in Paris. After serving a year as instructor in history at the University of California, he was instructor and lecturer in history at Harvard from 1915 to 1922, when he became Harold Vyvyan Harmsworth professor of American history at the University of Oxford. He served as a private in the United States Army in the War and was attached to the Russian division of the American Commission to Negotiate Peace in 1919. He was a member of many learned societies and wrote *Life of Harrison Gray Otis* (1913); *History of the Constitution of Massachusetts* (1917), and *Maritime History of Massachusetts* (1921).

**MORLEY, CHRISTOPHER** (DARLINGTON) (1890- ). An American editor and writer, born in Haverford, Pa. He graduated from Haverford College in 1910 and from that year to 1913 was a Rhodes scholar at Oxford. He served on the editorial staff of several publications and journals and from 1920 to 1924 conducted a column in the *New York Evening Post*. In the latter year he joined the staff of the *Saturday Review of Literature*. His books in prose and verse include *The Eighth Sin* (1912); *Songs for a Little House* (1917); *The Rocking Horse* (1919); *Travels in Philadelphia* (1920); *Pipefuls* (1920); *Tales from a Rolltop Desk* (1921); *Chimney-smoke* (1921); *Where the Blue Begins* (1922); *The Powder of Sympathy* (1923); *Inward Ho!* (1923); and *Parson's Pleasure* (1923).

**MORLEY OF BLACKBURN** (JOHN MORLEY), 1ST VISCOUNT (1838-1923). A British public official and man of letters (see VOL. XVI). From 1910 to 1914 he served as Lord President of the Council but resigned in the latter year after the declaration of war with Germany, which he opposed. He retired to his country home and devoted himself to the writing of a volume of recollections, which was published in 1917. In 1914 he published notes on politics. A complete edition of his works was brought out in 1921.

**MORNINGSIDE COLLEGE.** An institution at Sioux City, Iowa, founded in 1889. The student enrollment grew steadily from 584 in 1913-14 to 1300 in 1923-24, and the budget increased in the same period from \$60,000 to \$150,000. A chair of religious education, departments of economics and sociology, and a complete course in public school music were established, and additional faculty members attached to several other departments. Three fireproof buildings, Main Hall, a conservatory and a gymnasium, and a temporary science hall were built. An athletic bowl and bleachers was constructed. President, Frank E. Mossman, A.M., D.D.

**MOROCCO.** The largest of the Barbary states, in northeastern Africa. Since 1912

about 95 per cent of its area has been a French protectorate; the rest, except for the free zone around Tangier (q.v.), was under the protection of Spain. Total area, 231,500 square miles. The Spanish zone included 8280 square miles in the North. However, Spanish claims also took in the 9500 square miles in the Cape Juby region (southern zone) and the 580 square miles of Ifni on the west coast. By 1921 the French had effectively occupied 92,664 square miles. An official French census in 1921 gave the population for the French zone as totaling 5,400,000; urban population, 537,071. Of these, 399,979 were Mussulmans, 65,510 Jewish natives, and 66,875 Europeans (1025 British, 41,028 French, 14,114 Spanish, 9155 Italian). The largest cities in the French zone, with populations for 1921, were: Casablanca, 101,690 (35,283 Europeans); Marakesh, 139,874 (1956 Europeans); Fez, 70,540 (2217 Europeans); Rabat, 30,953 (9226 Europeans); Meknes, 36,592 (2622 Europeans). For the Spanish zone (northern), the population was estimated at 550,000; for Tangiers, at 50,000 (12,000 Europeans). Tetuan, in the Spanish zone, had 30,000 inhabitants. Immigration, which had languished during the War, became considerable again after 1918. In that year, 22,139 immigrants arrived; in 1919, 31,797 (14,929 French); in 1920, 27,797 (14,721 French). See TANGIER CONTROVERSY.

**Industry.** Agricultural and pastoral pursuits occupied four-fifths of the native population. Of the 25,000,000 acres in the French zone capable of cultivation, only 6,000,000 acres were being tilled. Barley and wheat received the most attention; other crops were beans, oats, maize, and millet. In the regions of Fez, Mequinez, Rabat, and Donkkala, 14,247 acres of vineyards were cultivated by natives; European vineyards covered 3715 acres (1921). Fruit trees, notably the olive, orange, lemon, palm, and almond, were beginning to play an important part. Stocks in 1921 in the French zone comprised 6,733,022 sheep, 2,040,304 goats, 1,517,117 cattle, 115,036 pigs, 420,232 asses, 202,006 horses and mules, 98,252 camels. Minerals included phosphates (80,583 tons exported in 1922), iron ore (115,489 tons exported in 1921 from the Spanish zone), and copper, lead, petroleum, and manganese. In the French zone in 1921 were to be found 268 industrial establishments with 4060 employees and a total invested capital of 173,298,090 francs; the capital invested in 1918 had been only 35,246,000 francs. As a result of European occupation, steady advances were made. The construction of roads, harbors, and sanitary measures were the particular concern of the French. The harbor of Casablanca received particular attention. The Spanish concerned themselves with irrigation projects as well as the expansion of the port facilities of Ceuta and Larache.

**Commerce and Communications.** The trade of the French zone increased regularly. In 1913 imports and exports had been 181,426,000 francs and 40,180,000 francs; by 1921 they had increased to 909,164,220 and 306,446,857. The 1921 imports originated in the following proportions: France and Algeria, 50 per cent; Algeria (land frontier), 20.7 per cent; United Kingdom, 16 per cent; United States, 9 per cent. The following, in order, received French Morocco's exports: France and Algeria, Spain, the United Kingdom, Italy. Imports from the United States were valued at \$214,460 in 1913

and at \$5,725,000 in 1921. The chief exports in 1921 were barley, eggs, beans, linseed, wool, and almonds. The following indicates the quantity, by quintals, of animal products exported for 1913 and 1920: cowhides, 15,544 and 5065; sheepskins, 18,730 and 12,878; goatskins, 16,815 and 18,407; wool, 38,897 and 15,633; eggs, 23,465 and 42,240; wax, 1141 and 1586. That the increase in trade was real, in spite of the inflation of the franc, may be seen by the fact that 2,921,000 tons of shipping entered French Moroccan ports in 1912 and 4,516,592 tons in 1921. The trade of the Spanish zone was as follows: imports and exports for 1913 were 25,335,000 and 2,876,000 pesetas; for 1921, 72,552,340 and 6,431,000 pesetas. The trade for Tangier was as follows: imports and exports for 1913 were 24,455,000 and 3,408,000 francs; for 1921, 59,379,252 and 4,522,460. Under the French administration, road building went on rapidly so that by 1922 2590 miles were open for use. As part of the same general plan for the opening up of the protectorate, military lines of 2 foot gauge were converted into standard gauge lines. There were 820 miles of such roads in 1922. The principal lines were the Fez-Oudja (223 miles), Fez-Casablanca (210 miles), Casablanca-Marrakesh (171 miles). In the Spanish zone a meter gauge line ran from Ceuta to Tetuan, and another from Rio Martin to Tetuan. Telephone and telegraph communications were widely extended, and wireless stations were erected at Fez, Marrakesh, Mogador, Tangier.

**Government.** In the French zone, as a result of increased activity, administrative costs mounted steadily. Expenditures in 1916-17 were 45,389,000 francs; in 1922, 261,171,495. Revenues continued in excess during the whole period with the result that the debt service carried annually was conspicuous. Of the 1922 budget, 44,730,154 francs were applied to the public debt, which in that year totaled 705,624,000 francs, of which 300,000,000 francs had been floated in 1922 as the first section of an authorized loan of 700,000,000 francs. The scheme encompassed a great series of public works, including the development of harbors, roads, water power resources, phosphate works, posts, telegraphs and telephones, health service, forestry, public instruction, etc. The budget for the Spanish zone in 1922-23 balanced at 17,097,268 pesetas. Education, under the foreign influence, made great advances. In 1912, the French zone had only 37 schools; by 1921, it had 192 with 25,159 pupils in attendance.

**History.** The partial withdrawal of French troops on the outbreak of the War, and the ever-present anti-European feeling which German agitators continually fostered, aggravated the unruliness long chronic in Morocco. As the War continued, French occupation was extended; the Tafilalet region was subdued by 1917, and an uprising of the Ait Atta there was put down, after desultory fighting, by 1919. France's policy of continuing public works and of befriending native chieftains stood her in good stead, for many of the powerful native leaders remained consistently friendly. In 1919 and 1920, as a result of trouble in the Sifru region and the Gharb, the French were able to push further into the interior, so that by 1923 most of the country, with the exception of the Middle Atlas, was effectively occupied. An exceptionally able administrator, Marshal Lyautey, occupied the post of President-General during the whole

period; and under his energetic direction remarkable progress was made in sanitation, road construction, railway-building, and education.

The Spanish problem in Morocco was less easily solved. Because of the tardy development of the Spanish zone and the difficulties of communication, the native independent temper was less easy of subjugation. Brigandage continued the rule; the Rif and Jebala tribes were particular offenders. Most of the dissident spirits gathered around Raisuli, one of the important chieftains. From 1916 to 1919 all attempts to eject him from the Tangier-Tetuan road which he held were unavailing; when he finally evacuated the country he merely moved to another centre of operations. The upshot was that by 1920 the Spanish were abandoning one interior post after another. In 1921, the fighting broke out with greater fierceness. Under the Rif attacks, Spanish forces lost Nador, Zeluan, Mt. A-ruit, Sheshuan, Tefer, and even Penon de Valez, an island east of Ceuta. In September and October of the same year, strong Spanish forces carried the war into the Rif country and after many engagements retook Nador and Zeluan and cleaned out the heights around Melilla. Desultory fighting continued throughout 1922. That the country was not pacified and could not be so long as the inefficient Spanish military juntas continued to exert a preponderant influence in Morocco, was indicated when the Rif tribes once more took up arms in 1923 and occupied the Tetuan-Sheshuan line. The action indicated how universal disaffection was, for it followed the pledge of loyalty given the Spanish occupation by Raisuli, about whom, heretofore, most of the rebellious forces had gathered. The influence of this succession of reverses on the local situation was momentous. (See SPAIN.) In July, 1922, the Spanish High Commissioner-General, Berenguer, was forced to resign; his successor, Gen. Ricardo Burguete, found it necessary to retire in December; and in September, 1923, because of the unsatisfactory handling of the whole situation, the Spanish government was seized in a coup d'état and a military dictatorship under General Rivera was created. In spite of the lofty pretensions of the Directorate, Morocco remained unconquerable, the continued impertinences of the tribesmen only revealing the impotence of Spain the more clearly. Rivera had announced in the beginning his intention to accomplish the extrication of his country from her Moroccan entanglement. But no party favored such a move, and it was doubtful whether Rivera could take the step even if he would. The result was repeated Rif victories. In 1924 engagements were reported in which a Spanish Foreign Legion column was lost, several Spanish airplanes brought down, and a Spanish cruiser openly shelled. Early in 1924, 80,000 tribesmen were marching on Melilla; among the Spanish troops gathered to oppose them, a mutinous spirit was plainly visible. To July, 1923, the cost of pacification since 1909 was put at 2,494,000,000 pesetas, and the end, evidently, was not yet in sight. For the Tangier controversy, see TANGIER. See also SPAIN and WAR IN EUROPE.

**MORRIS, JAMES CRAIK** (1870- ). An American bishop, born at Louisville, Ky., and educated at the University of the South, the Louisville Law School, and the General Theological Seminary. He became a priest in the

Protestant Episcopal Church in 1896 and was the curate of churches in Texas and New York. From 1901 to 1916 he was dean of St. Mary's Cathedral in Memphis, Tenn., and from 1916 to 1919, rector of Grace Church in Madison, Wis. In 1920 he was consecrated bishop of the Panama Canal zone and parts adjacent.

**MORRIS, ROBERT TUTTLE** (1857- ). An American surgeon, born in Seymour, Conn., and educated at Columbia University. He settled at first in Albany. After removing to New York, he became a professor of surgery at the New York Post-graduate Medical School in 1895. He is the author of many books, including *How We Treat Wounds To-day* (1886); *Lectures on Appendicitis* (1895); *Dawn of the Fourth Era of Surgery* (1910); *Microbes and Men* (1918); *A Surgeon's Philosophy* (1918); *Doctors vs. Folks* (1918); *The Way Out of the War* (1918); *Nut-growing* (1921). As the titles imply, some of these books are semipopular and others non-medical in scope.

**MORROW, DWIGHT WHITNEY** (1873- ). An American lawyer, born at Huntington, W. Va., and educated at Amherst College and Columbia Law School. In 1899 he began the practice of law in New York City as a member of the firm of Simpson, Thatcher, and Bartlett. In 1914 he became a member of the firm of J. P. Morgan and Company. He took an active part in civic matters in New York City and in New Jersey. He was director of the War Savings Committee of New Jersey (1918). During the War he served with the Military Board of Allied Supply and received the Distinguished Service Medal.

**MORTAR, TRENCH.** See TRENCH WARFARE MATERIAL.

**MOSELEY, GEORGE VAN HORN** (1874- ). An American soldier, born in Evanston, Ill. He graduated from the United States Military Academy in 1889 and was commissioned 2d lieutenant in the cavalry in the same year. He rose to the rank of major in 1916 and in 1917 was appointed colonel in the National Army, with the command of the 5th Field Artillery. He was appointed chief of the 4th Section of the General Staff at General Headquarters in 1918 and had general charge of the strategic supply, transportation, construction, and evacuation of the American Army in France. He was a member of several important commissions, including the Harbord Commission to the Near East, where, after commanding the 2d Field Artillery Brigade, he was assigned as assistant to General Dawes in 1921. He was awarded the Distinguished Service Medal and was given decorations by the Belgian, British, French, and Italian Governments.

**MOSUL.** See MESOPATAMIA.

**MOTHERS' PENSIONS.** "Mothers' pension" laws, or laws providing for public aid to dependent children in their own homes, are intended to conserve family life by preventing the break-up of homes after the death, desertion, or disability of the father. The first State-wide mothers' aid law was passed in 1911, two years after the White House Conference on the Care of Dependent Children, called by President Roosevelt, had declared as its fundamental proposition that children should not be deprived of home care except for urgent and compelling reasons, and that "children of parents of worthy character . . . and children of reasonably efficient and deserving mothers who are without

support of the normal breadwinner, should, as a rule, be kept with their parents, such aid being given as may be necessary to maintain suitable homes for the rearing of children." The "mothers' pension" movement became an effective answer to the arguments of opponents of child labor legislation that children of widowed mothers would be helpless if they were not permitted to work. By the close of 1913, 19 States had State-wide mothers' pension or aid-to-mothers laws, and Missouri had provided for such aid in Kansas City and St. Louis. By 1924 such laws were in effect in 42 States, Alaska, and Hawaii.

At first the aid was usually limited to widows, but the conception of this method of provision for children has gradually widened, until by 1924 only four States of the 42 in which laws were in operation limited the grant to children of widows, though all the States included widows directly or by implication. The Colorado act included a parent, or other person designated by the court, who because of poverty was unable to provide properly for a dependent child. Children of widowed or deserted mothers, and of mothers whose husbands were serving penitentiary sentences or were physically or mentally incapacitated, were commonly included. The ages under which children were eligible for aid ranged from 14 to 17 years and one State (Ohio) mentioned no age limit; in many States the upper age limit had been made to correspond with the upper age limit of the child labor law, so that aid might be continued until the child was legally permitted to go to work. In the majority of States maximum amounts were specified, ranging from \$8.66 to \$35 a month for one child, with additional amounts (usually smaller) for each additional child. Frequently the maximum amount for a family of any size was specified in sums ranging from \$40 to \$60, but in many States there was no such limitation. The amount of aid granted to each family can be adjusted to the actual needs of the family only if the maximum amount authorized by law is sufficiently high or if no limit is specified. The administration of the aid-to-mothers law was vested either in a court having juvenile jurisdiction, a county or town board granting poor relief, a county board of public welfare, a special county board, or a State board. There was some form of State supervision in 23 States in addition to those in which definite administrative authority was lodged in a State board.

Survivors' insurance under governmental auspices, providing pensions for both widows and orphans, existed in Germany, France, Holland, and Austria, by 1924. In Great Britain, in that year, a measure to establish a mothers' pension system was in preparation. Canada, Denmark, and New Zealand also had made public provision for mothers with young children to support.

**MOTOR SHIP.** See SHIPBUILDING AND NAVAL ARCHITECTURE; SHIPPING.

**MOTOR VEHICLES.** Despite the marked advances in the design and production of all forms of motor vehicles during the decade 1914-24, it is believed by those familiar with automotive engineering that so far as designs are concerned there is still room for improvement. The most apparent improvement was in simplifying

and strengthening the mechanism so that cars of all types were reliable in action and capable of running thousands of miles without mechanical failure and of serving their owners for two or three years without overhauling and with only the most cursory repairs and attention. Of the three well-known forms of motive power, steam, electricity, and the internal-combustion motor, the last reigned almost supreme; by far the greatest number of motor vehicles in use depended on it for propulsive power.

**Electric Automobile.** Electric automobiles were still used in fair numbers. Storage batteries were increased in capacity without a proportionate increase in weight, by more careful design and construction, and were installed, especially on vehicles intended for commercial use, in shock-insulated containers which were readily accessible for examination and easily changed for fully charged batteries as replacements. This was valuable in cases where it was not always possible to lay up the vehicle for the time necessary to recharge the battery if exhausted in service.

**Gas-electric Trucks.** Combination gas-electric trucks have been designed and put to practical use. In these, an internal-combustion motor drives a generator, which in turn keeps a charge of electricity in the battery. The wheels are driven by electric motors; in some cases, there is a separate motor in each rear wheel. In special applications, such as fire apparatus of the heavier types, there may be a motor in each of the front wheels and none in the rear. There are other forms which have a driving motor in each of the four wheels, all of which may be moved at an angle from the normal direction of vehicle movement to make steering easier. There is still another system in which a small engine is operated at constant speed while the vehicle is in motion, regardless of the vehicle speed; the generator supplies current to a driving motor, and the storage battery, which is smaller than that ordinarily used in an electric automobile, is "floated on the line" so that it absorbs excess current when power requirements are less than that supplied by the engine-generator combination, and it gives out electricity to the power motor when conditions of road or gradient are such that more than the normal energy output is required. Such combinations are cumbersome and relatively inefficient and have not won much recognition.

In order to increase the cruising radius per charge, some makers of electric vehicles use as motive power a motor which can be turned into a generator by a simple control lever movement when coasting down hills; advantage can be taken of the conversion of mechanical power due to vehicle momentum produced by gravity into electrical energy which is "stored" in the storage battery of the vehicle. Tests made by competent drivers have shown an increase per charge in cruising radius of from 10 to 15 per cent when the driving motor may be used as a dynamo under favorable conditions.

**Trackless Trolleys.** Still another form of motor vehicle using electric motors for power is a hybrid between the usual form of electric rail car and the self-propelled motor vehicle; it is built just like an electric automobile as far as chassis and body construction go, as well as in the placing of the driving motor and the character of control and power transmission ele-

ments. No storage battery is provided in some cases, but a trolley pole taking current from a pair of conductors overhead is used. In other forms, a battery of limited capacity is supplied to take care of cross-overs or to permit the vehicle to change from one line to another at points where the current conveying conductors themselves do not change. Owing to the use of rubber tires, these trackless trolleys, as such vehicles are called, cannot use rails as a return; so the current must enter the vehicle circuit by one trolley wheel, and after it has done its work, it passes back into the return conductor of the line through the trolley wheel which is electrically insulated from the other. The overhead conductors must also be carefully separated from each other. The vehicle is steered from one side of the road to the other just as the more conventional automobile is and it can thus pass around slower traffic that might retard a car running on rails. The expense of operation is reduced over the form needing rails to run on because no roadbed need be provided other than the highway used by all vehicular traffic.

**Steam Automobiles.** Steam automobiles are rapidly decreasing in number in the United States, where their application in the past has been mostly for passenger use; but they are still used to some extent in England for commercial purposes. Several marked improvements have been made in steam automobiles and some of the objections formerly advanced against them are no longer tenable. One of these was the frequent refilling of the water-supply tank, which in the case of the earlier Stanley steamers was necessary every 25 or 30 miles. This was because the steam was exhausted directly into the air after it had passed through the engine. The modern steam automobile exhausts the steam into a condenser mounted at the front of the chassis just as the radiator or water cooler is in vehicles propelled by internal-combustion motors. The steam condenses, and the cylinder oil is separated from it; the resulting water obtained by cooling the steam is pumped back into the tank and used again as boiler-feed water. The cruising radius on one tank of water is increased from 6 to 10 times what would be possible without the condenser.

The other big improvement has been the use of the Doble combustion system, in which the usual form of Bunsen or Argand burner flame or "fire" is replaced by a more intense blow torch or blast flame, which burns in a closed combustion chamber, under the boiler, lined with refractory material. This reduces the fire risk incidental to the use of the older form of Bunsen burner. Not only is a hotter fire obtained, but it is more easily started. The older form of burner was started from a "pilot" or small auxiliary burner which was started initially by preheating with a plumber's blow torch. It took 15 to 20 minutes to start the generation of steam with the fire-tube boiler and old burner combination before enough steam had been generated to supply the engine. In the new combustion system, an electrically driven air blower supplies the blast and vaporizes the fuel sprayed into the air stream thoroughly. So completely are the two mixed that the resulting vapor may be ignited almost instantaneously by an electric spark plug such as used in internal-combustion motors; as a flash boiler is used, steam generation starts almost as soon as the combustion chamber is filled with burning gas. A generator driven from the

steam engine while the vehicle is in motion keeps the storage battery charged. The battery supplies the blower motor with current and furnishes the igniting spark for the electric "pilot" and current for the usual complement of lamps used in night driving. The engine used in either case is the simple, two-cylinder double-acting type, directly geared to the rear-axle differential-drive gear. Much better results are obtained with kerosene or fuel oil in the blast combustion system, and the burner cannot clog so easily as when a Bunsen burner is used with fuels of other than high volatility, when imperfect combustion causes carbonization of the numerous fine fuel vapor spray orifices.

**Internal-combustion Motors.** The most notable change between 1914 and 1924 in automobiles utilizing internal-combustion motors for propulsion was in the power plant. No passenger automobile worthy of the name is built with less than four cylinders, and while the majority of motorists use four-cylinder cars because these are produced in such large quantities, the six-cylinder type is also very popular and is favored by most builders of passenger cars. Eight-cylinder engines are used to a limited extent, the V-type being favored in some quarters and the eight-in-line or straight-eight by other makers. There is no "best" type; each fills a real demand. For the low- and medium-priced car and commercial vehicles, it will be difficult to replace the economical, simple, and easy-to-maintain four-cylinder engine. For 1924, 120 chassis models of passenger cars were produced by 95 manufacturers. About 70 per cent of these were equipped with six-cylinder engines; this form is thus favored by most designers. The four-cylinder type, which is used on about 80 per cent of the automobiles manufactured, was found on about 20 per cent of the models, while the eight-cylinder was used on only 10 per cent of the models. Racing engines have demonstrated that by the use of more costly construction, such as a counterbalanced crankshaft, a four-cylinder may be run with very little vibration. The increase in cost might be just as well employed in building six-cylinder engines as in improving the four-cylinder, because no four-cylinder can give the overlapping explosions or power impulses of the six-cylinder engine. This explains why designers favor the six-cylinder form. Designers of "luxury" cars provide eight-cylinder engines, because the power impulses occur with such frequency that an almost continuous power application to the driving wheels is secured, and the resulting smooth action is reflected in the riding qualities.

The efforts of designers of internal-combustion motors for vehicle use seem to have had two main objectives; first, to secure maximum efficiency; secondly, to secure quiet operation and freedom from vibration. As a quiet engine is usually efficient, improvements in engine construction to attain one object often effect the other. The automobile engine of 1924 differed from that of 1914 in numerous respects. It was smaller; that is, its cubic capacity was less; yet the power developed was greater. Higher compression pressures are used, which mean greater power to the explosion. Marked improvements in lubrication systems, lighter reciprocating and rotating parts, and improved materials permit of higher speeds. Of valve materials available, a silicon-chromium steel alloy will withstand a white heat repeatedly and also repeated cooling

VIEWS OF HAYNES SIX-CYLINDER UNIT POWER PLANT

without warping or scaling. Aluminum alloy pistons of the split skirt type may be as closely fitted to the cylinders as cast-iron pistons weighing two or three times as much; with no loss of reliability or endurance, they permit the engine to run at much higher speeds because the inertia forces are reduced. Connecting-rods are being made of duralumin, an aluminum-magnesium alloy which has the strength of steel and may be heat-treated after forging as steel is and yet weighs only one-third as much. Pressure-feed oiling systems are generally used, even on low- and moderate-priced cars. Systems of this type have positive oil supply to the various main bearings, and passages drilled in the crankshaft supply the connecting-rod big ends. As the pressure produced by the positive acting mechanical pump may run as high as 80 or 90 pounds per square inch, it will be evident that an oil film may be maintained on all important bearings even at high engine speeds.

**Improved Fuel.** Not only the physicist and mechanical engineer are concerned with improving engine efficiency; the chemist has also helped.

A large and prominent company, the General Motors Corporation, has developed in its research laboratories a treatment for gasoline that will permit engineers to obtain double the mileage possible with untreated fuel. In brief, it was determined that the knocking noticed in the average engine when climbing a hill with gas throttle wide open could be eliminated by adding about one-tenth of 1 per cent by volume of a liquid called tetras-ethyl-lead to the gasoline. While such a discovery increases the efficiency of the present types of engine and adds to the comfort of the driver, its greatest importance lies in the fact that engines can be built in the future to use this fuel with twice the amount of compression of present-day engines. When this is done, without any decrease in engine dimensions or sacrifice of speed and hill-climbing power, twice the present mileage per gallon of fuel will be obtained.

Even in engines of the eight-cylinder type, every care is taken to secure balanced operation. In the 1924 Packard, a type of crankshaft is used marking a departure from usual straight-

eight practice. Four crankpin throws, two at each end of the shaft, are set at right angles to the centre four throws. This makes possible an interlocking firing order which cancels both the primary and secondary forces and eliminates vibration completely. The secondary unbalanced forces are completely neutralized or "cancelled out" because in any engine employing reciprocating and rotating masses in balance at all times, no vibration will be transmitted throughout the car at certain critical engine speeds. Inherent balance is secured in the Cadillac V-type, eight-cylinder engine by a new arrangement of the crank throws, and compensators or counterweights are added. The four cranks are in two planes at right angles to each other, instead of in one plane as in previous V-eight practice. This type of engine, which is really a twin four, —formerly used a short, compact crankshaft similar to that employed in a four-cylinder engine. The new arrangement may be easily understood; if the crankpin at the forward end of the shaft be considered to correspond with the figure XII on the clock dial, the second crankpin would fall at III, the third crankpin at IX, and the fourth pin at VI.

**Engine Refinements.** Having greatly reduced vibration by lightening and balancing reciprocating as well as rotating parts, the next effect to secure is quiet engine operation. The thorough enclosure of all working parts formerly left in the open, as valve springs and valve lifting tappets or push rods and rocker arms, has made it possible to lubricate these parts and reduce noise by the reduction of mechanical depreciation and resulting lost motion or rattle, as well as by the deadening effect enclosure has on minor sounds. Sleeve valve motors of the Knight design are much more extensively used both in Europe and the United States than formerly, and of course the sliding sleeves work without the clatter found in poppet valve engines after they have been used for a time. The valve operating camshaft drive has also been improved. Where a gear train is used, the gears have angularly placed teeth, and one or more gears of the train are made of some sound-absorbing material, such as treated, compressed cotton or phenol condensite. A very popular method of driving the camshaft and auxiliaries is by silent chains of the link-belt form; automatic tightening devices are provided to take care of the stretching of the chains in service.

**Ignition Systems.** Ignition systems have been greatly improved, and nearly all passenger cars use a single coil-distributor battery system. Air-cooling is also receiving practical application; the leading exponent of this form of engine for automobiles, the Franklin Company, developed a type of engine in which a blower rotor member on the crankshaft supplies an air blast through jackets which confine it to the cylinder walls and other parts to cool the engine directly, without the use of water as an intermediary heat-absorbing medium. Such a cooling system is independent of climate, as it cannot freeze at extremely low temperatures or boil away at high temperatures.

**Starting and Lighting Systems.** The electric starting and lighting systems have been simplified and are now practically meddle-proof. The Bendix drive or automatically engaging drive pinion has greatly simplified the mechanism necessary to put the engine in motion.

GENERATOR AND STARTING MOTOR USED ON SOME MODELS OF CHEVROLET AUTOMOBILES

The upper figure shows the generator which has important components of ignition system, such as induction coil and timer distributor, mounted thereon. Below is the starting motor, having the Bendix automatic starting pinion shift. When the motor is started by the switch, the armature rotation automatically engages pinion with gear teeth cut on flywheel.

There is no need of shifting gears or clutches in the modern starting system. A pressure of the foot on the starting switch button or pedal starts the electric motor turning. A pinion having a spiral thread cut in its bore is mounted on the motor armature shaft so that the rotation of that member causes the pinion or small gear to move laterally as well as to rotate until it meshes with and turns the flywheel, which has corresponding teeth cut around its outer periphery. Sufficient reduction is secured so that the electric motor rotates the crankshaft of the automobile power plant and starts the engine on its cycle of operations. As soon as the engine starts, the electric motor is disconnected from the battery and the pinion automatically moves on the spirally threaded armature shaft until it is out of engagement with the flywheel.

**Generators.** The generator has also been greatly simplified. The most popular forms employ the third brush system of current output regulation instead of the centrifugal governors, slip clutches, separate resistances, etc., of the older systems. A simple form of automatic current cut-out prevents the battery from discharging back through the generator when it is not turning fast enough to generate charging current. The single wire system is also a step forward in simplifying the layout. Instead of using two wires for each circuit, only one insulated wire is used; the metal frame of the car is used for a return or ground, and one

pole of each appliance, such as lamp bulbs, horn, etc., is grounded to the frame or some metal part in good electrical contact with it. The wire is carried in a metal sheath to prevent chafing the insulation, and every precaution is taken to make all connections in such a way that no trouble will be experienced. Such a system is known as a two-unit system when separate starting motors and generators are used, but the Delco one-unit system is also deservedly popular. In this, a single motor-generator suffices. Two commutators are provided on the armature shaft; one of these is used when the machine is used as a starting motor, and the other commutator and set of brushes come into action automatically when the engine has started and is running fast enough to turn the armature shaft by an automatic driving clutch.

**Carburetors.** There was considerable change, during the period 1914-24, in the form of carburetor; and devices using automatic air valves,

which were formerly very popular, were used less than the compensating jet type as exemplified in the Zenith carburetor. The automatic air-valve type was apt to be noisy on account of "fluttering" of the valve, and the moving parts sometimes gave trouble by premature wearing or loss of adjustment. There are no rapidly moving parts in modern carburetors, only the float feed control mechanism, which is very simple and not apt to get out of order. The Zenith carburetor has two jets, one inside the other, projecting into the venturi of a plain-tube mixing chamber. No adjustment is provided at the spray nozzles, and by utilizing an ingenious hydraulic-pneumatic principle, compensation is provided automatically, as the throttle is opened and mixture proportions best suited for various operating conditions provided. Another popular carburetor is known as the metering-pin type. In this, an automatic air valve carries a needle or pin which regulates the opening of the spray nozzle; as more air is admitted to the mixture by the lift of the valve, the metering pin also lifts and permits an increased flow of liquid fuel. A very practical modern device is

THE ZENITH CARBURETOR

This fuel vaporizing device gives automatic mixture compensation without air valves.

Packard Fuelizer applied to twin-six engine provides warm fog or vapor to mixture so as to make easier starting of engine in cold weather.

the "fuelizer" in its various forms. This makes starting easy at low temperatures when vaporization of fuel by ordinary methods would be

difficult. The Packard fuelizer, which may be considered representative of devices of this character, consists of a chamber which is an auxiliary to the carburetor in which the vapor may be ignited by an electric spark passing between the electrodes of a spark plug. The combustion is not complete, because the air supply is limited; but a warm fog is produced which heats the rest of the mixture so that it ignites readily in the engine cylinders even in zero weather. Another carburetor auxiliary is an air filter or cleaner. Chemical analysis has disclosed that the carbon deposit in the combustion chambers of automobile engines is composed largely of road dust sucked in on the aspiration stroke through the carburetor. Various forms of filters and separators are provided through which all air passing into the carburetor must first go in order to cleanse it of dust particles. Considerable depreciation of engine parts has also been attributed to the abrading action of the non-combustible mineral matter drawn into the engine with the fuel mixture. The simplest and most compact device operates on the centrifugal separator principle. A rapidly revolving fan wheel throws the dust particles aside as the entering air-stream passes through the device and clean air enters the engine.

**Fuel Supply.** The gravity feed of fuel to the carburetor has been perfected by the use of a small auxiliary container known as a "vacuum" tank which draws its supply of fuel from the main tank, which may be placed at any desired point on the chassis, by utilizing engine

method of securing gravity feed by placing the tank under the front seat. The Ford car is the

THE STEWART VACUUM TANK

Almost universally used as a means of fuel supply, is placed near the carburetor, which it supplies. It draws gasoline from a tank at rear of chassis.

A—Suction valve for opening and closing the connection to engine intake manifold.

B—Atmospheric valve permitting or preventing an atmospheric pressure condition in upper chamber.

C—Pipe connecting tank to engine intake manifold.

D—Pipe connecting vacuum tank to main gasoline supply tank.

E—Lever to which two coil springs S are attached. This lever is operated by movement of the float G.

F—Short lever operated by the lever E and in turn operating valves A and B.

G—Float.

H—Flapper valve in the outlet T, closed by suction whenever the valve A is open, but opening when the float valve has closed suction valve A and opened atmospheric valve B.

K—Line to carburetor extended on inside of tank to form pocket for trapping water and sediment.

L—Channel space between inner and outer shells connecting with air vent R.

R—Air vent over atmospheric valve for preventing an overflow of gasoline in case the position of vehicle should ever be such as to raise the gasoline supply tank higher than the vacuum tank.

T—Outlet at bottom of float reservoir, in which is the flapper valve H.

W—Plug for temporary removal while driving to service station in case of trouble due to leaky float and for giving access to tank for wetting valves with gasoline when dry and for washing dirt or sediment from flapper valve H.

U—Guide for stem of float G.

TYPICAL MODERN FUEL SUPPLY SYSTEM

A vacuum tank is interposed between main fuel container and carbureting device.

suction. Its mechanism is so simple and its action so positive that most of the automobiles built at the present time have this method of fuel supply incorporated in their construction. The suction chamber is connected to the intake manifold of the engine by a short tube and with the fuel tank at the rear of the chassis by a length of tubing. A simple float mechanism is used to shut off the fuel flow when the float chamber is full. This trips a lever carrying two valves, one of them shutting off the suction pipe, the other opening an air-valve which admits air from outside. A flap valve opens at the bottom of the float chamber and permits the fuel to flow into the supply chamber connected with the carburetor by suitable piping. When the upper chamber empties itself, the float falls, and the suction valve unseats to let the engine create a partial vacuum in the float chamber. The pressure of the air on the liquid fuel in the main tank raises it to the auxiliary tank in the engine compartment. Pressure feed by engine-driven air pump and auxiliary hand-operated air pump is found only on a few high-priced cars. Very little use is made of the cowl tank or the

only passenger automobile using the latter location. The Overland uses a cowl tank. Some motor trucks of the speed wagon type have the fuel tank carried on the dash or bulkhead separating the engine from the driver's compartment.

Formerly, several types of clutches received almost equal application; the cone clutch was very popular, and the multiple-disc clutch ran it a close second. Single-plate clutches were in

the minority. In 1924, on the basis of the number of models of cars produced rather than the number of any one model in use as a gauge of popularity, the cone clutch was used on only 3 per cent of the models, the multiple-disc clutch on 43 per cent, and the single plate clutch on 54 per cent. The all-metal plate clutch was seldom used; designers favoring the multiple-disc system used plates faced with Raybestos friction material, alternately with metal plates. The most popular single-plate clutch design has a driven member of cast iron engaging "floating" discs or rings of woven asbestos friction material interposed between it and the two driving faces, also of cast iron.

**Gearsets.** Considering change speed gearing, practically all passenger cars with the exception of the Ford employ the sliding gear system. The conventional gearbox operates on the selective principle, which means that it is possible to engage any desired set of gears directly from neutral without first passing through lower ratios, as was necessary with the progres-

sive system. The flexible control possible with the modern engine, even the four-cylinder form, has made the use of more than three forward speeds and one reverse unnecessary except on the heavy passenger cars and commercial vehicles which use four speed gearsets. In fact, several motor trucks are equipped with "two range" gearsets. By the use of two sets of constant mesh gears between main and counter shafts, either of which may be used at will, it is possible to have a high speed range for all favorable conditions and a low speed range when loads are heavy or roads are poor. By this construction it is possible to convert the usual three-speed selective gearset into one giving six forward speeds and two reverse. Numerous motor-

truck designers now provide what is known as a "power take-off" on the gearset, this being a short shaft driven by the gearing so that engine power may be delivered to a screw hoist mechanism to operate a dump body or to a winch or windlass carried by the chassis for hoisting. Some passenger car gearsets have a power take-off, so that an engine-driven tire pump may be attached to the gearset. The 1914 disharmony of opinion regarding gearbox placing resolved to that form of unit power plant in which the change speed gears are mounted in a case forming an extension of the clutch housing member which is bolted to the engine. All parts are thus maintained in line and the alignment cannot be influenced by chassis frame deflection or distortion. The unit power plant construction was found in 1924 on 85 per cent of passenger cars and most trucks not of long wheelbase. The amidship location was found on only 13 per cent of passenger-car models. Whereas 20 per cent of 1912 models had the gearset attached to the rear axle, in 1924 only one make of car used this construction. One make had the gearbox mounted at the front end of the torque tube.

The full-floating axle was found in 1914 on more than 60 per cent of the models, but it lost ground steadily, and in 1924 was used on only 16 per cent. The semi-floating axle, which was considered suitable only for cheap and light cars in 1914, and as a result of this belief was found on only 20 per cent of the models, gained ground and occupied the same position in 1924 that the full-floating type did 10 years previously, as it had come to be used on 60 per cent of the models. Improvements in axle steels and housing construction, as well as the use of a smaller number of bearings and simpler construction, all contributed to the popularity of the semi-floating design. In an endeavor to combine the good features of both semi-floating and full-floating types, an intermediate design known as the three-quarter floating was evolved and was found on about 20 per cent of the models. Practically all axles used in passenger-car construction were of the bevel gear drive type, but straight-tooth bevels were found only on the Ford; all other automobiles were driven by spiral bevel gears because of their greater quietness. Worm-drive axles were found only on electric passenger cars but were very popular in motor-truck construction. The bevel pinion type of differential mechanism is universally used, and while various forms of positive differentials were devised in an attempt to prevent loss of traction of the wheel that has the poorest adhesion to the ground, few of these were applied as standard equipment except in motor trucks.

TYPICAL THREE FORWARD-SPEED AND ONE REVERSE SELECTIVE SLIDING GEARSET

Brakes. Two of the most discussed innovations in the 1924 automobiles were four-wheel brakes and balloon tires. There is no question but that four-wheel brakes have many advantages, but there is also much to be said against them. Some makers furnished them as standard equipment; others supplied them optionally. The principle of operation of front-wheel brakes is the same as that of the members on the rear wheels, and no argument is possible against any motor vehicle's stopping quicker if all four wheels are retarded than if only the traction members are stopped. Provision must be made, however, to prevent locking of the front wheels

when the brakes are applied, on account of the danger which attends the stopping of a rapidly moving vehicle when the front wheels are displaced by the steering mechanism in rounding curves. As long as the ability to steer a car depends on the rolling motion of the front wheels, stopping this must make the car more difficult to control. The wear on the brakes will be less when four are used to stop the car than when only two are employed. It is stated that half the pressure of the foot on the brake pedal will stop the car in the same distance as with two wheel brakes and that the same exertion will stop it in half the distance. Engineers who favor four-wheel brakes do not all agree on the type of brake or on the method of operation. Some favor internal expanding bands or spreading shoes; others favor external constricting bands. While in most cars the brakes are actuated by mechanical linkage and equalizers, some makes have hydraulic operation. In the last-named system a master cylinder is mounted on the transmission case; the brake pedal is attached to a piston rod which forces oil out of the cylinder through pipes running to the brake and operating cylinders at the wheels. This method provides for compensation or equalization to make sure that all brakes are applied equally without mechanical linkage. To show how rapidly four-wheel brakes were gaining in favor: in 1923 only one American model furnished them as standard equipment, 20 per cent of the models had the emergency brake on the drive shaft and service brakes on the rear wheels, and 76 per cent had both sets of brakes on the rear wheels only. In 1924 about 14 per cent of the models had four-wheel brakes as standard equipment, 29 per cent had one of the braking effects on the drive shaft, and 57 per cent of the models had both brakes acting on the rear wheels. Nearly 20 per cent of the models have four-wheel brakes optional at extra cost.

**Tires.** No discussion of recent features of motor vehicles would be complete without brief mention of low-pressure, oversize, light-walled tires known as "balloon" tires. The essential feature is the cushioning effect obtained from a low-pressure tire on rough roads. Of equal im-

portance with the increased comfort to passengers is the effect on the mechanism and the car body. So far, no way has presented itself of making deliberate comparisons between high-pressure and low-pressure tires in preventing a

car from developing rattles, creaks, and mechanical depreciation, because balloon tires are of such recent derivation. In 1924 there were three types of balloon tires ranging from oversize cords through semiballoon tires intended to fit the same rims as for high-pressure tires to the true balloon tires, which have great width and which require special small-diameter wheels and wider rims. That a marked improvement in riding comfort will be obtained from a tire having an internal pressure of 30 pounds over one carrying the same load on a lesser volume of air at 70 to 80 pounds' pressure is obvious. The side walls of a true balloon tire are lighter and more flexible than those of a high-pressure tire, because the tire is supposed to yield to minor obstacles, such as stones in the road, instead of riding over them. Experiments have shown that balloon tires, when properly selected, should be as enduring and give as long life as the high-pressure tires they replace. It is also stated that they are not liable to puncture any quicker than tires having heavier side walls and treads, because they yield and throw aside a puncturing object which would penetrate a more rigid tire.

Most motor vehicles are sold with a very complete equipment. Stock cars are furnished with bumpers, luggage carriers, rear stop signals, windshield cleaners, shock absorbers, thermostatic water-circulation regulators, disc wheels, and numerous other devices. Bodies were greatly improved in appearance, and even those fitted to low-price chassis were complete in appointments and graceful in outline. The demand was increasing for closed cars of the sedan and coupé type, and the majority of people purchasing new cars were ordering the all-year, all-weather closed bodies instead of the open models. A new process of body painting greatly increased the life of the finish over the process which, developed in carriage shops, was formerly almost exclusively used for motor vehicles. Instead of being applied with a brush, the new material, a modified pyroxilin lacquer, is sprayed on the body; when it hardens it gives a celluloid-like coating which cannot be scratched by dust, affected by road tar, cracked by extremes of heat and cold, or deteriorated by exposure to weather. The high finish obtained by the use of gloss varnish is lacking, but a practical finish is secured which does not soon lose its lustre.

**Commercial Vehicles.** In the field of commercial vehicles, the most marked development of the decade 1914-24 was in motor busses for transportation as a public utility. Busses came to be operated with much success in city services as auxiliaries to the electric street railways, as well as traction line feeders, on inter-city lines, for de luxe tours, for schools, and for sightseeing. They have become a very definite part of the United States' transportation system. Just as motor trucks successfully proved their economy and dependability as independent freight

carriers, the motor bus was fast becoming a vital factor in passenger transportation. Special chassis designs were evolved for carrying bus bodies. By dropping front axles, underslinging the front and rear springs, and in some instances having the frame side members dropped between the springs, busses were evolved which were easy of access and had a low centre of gravity. When a bus body is mounted on the usual type of commercial automobile chassis, it is apt to sway in turning corners, to skid on slippery streets, and to be uncomfortable for passengers. In order to secure easy riding, special spring suspensions and giant pneumatic tires are employed.

Very heavy loads are now carried on large cord tires, and even freight trucks are carried by the more resilient instead of the solid rubber tires. Truck tires are made 8 to 10 inches in width and 40 to 42 inches in diameter, with extra-heavy treads and side walls so that internal pressures from 120 to 130 pounds may be safely withstood. Bus bodies are sometimes carried by special resilient supports, either in the form of rubber pads or metal spring members attached to the chassis frame. One marked improvement was the use of rubber shock absorbers or insulators at the spring ends to replace metal shackles, which soon wear. It is stated that a life of 100,000 miles is not uncommon with the rubber insulators, which act to reduce vibration. The rubber blocks are molded in suitable shapes to carry the spring leaf ends and permit the spring leaves to flatten out under load and to move as the spring deflects under the influence of varying highway surface contour. The blocks of rubber are carried in malleable iron housings forming part of the chassis and are easily renewed when worn.

**Motor Rail Cars.** Many railroad lines have lost so much of their freight and passenger traffic because of the greatly increasing use of motor vehicles that they have found it unprofitable to operate the usual steam train on short lines. The modification of the motor vehicle known as the rail car has come to the rescue, and motor-truck engineering is followed in many respects. In some cases, the rubber-tired wheels are replaced with flanged metal wheels adapted to run on rails; no other change is made in the chassis. The use of antifriction bearings of the ball and roller type, alloy steels, and aluminum and pressed-steel sections assures heavy-duty qualifications with the economy of light weight. The power plant, change speed gearing, clutch, and power transmission are modified from motor-truck types. The engines are truck engines and usually of the four-cylinder type. Between the engine and the main transmission an auxiliary reverse transmission is installed which serves to change the direction of main drive shaft rotation when it is desired to reverse the car, and as many reverse speeds as there are forward drive ratios are thus provided. Small rail cars with a passenger capacity of 30

persons may be operated for \$.30 per car mile, and as the rate on short line work may be from \$.04 to \$.05 per mile per passenger, such cars can show a profit even if the car does not carry its full capacity on all trips. These cars climb grades well and are controlled much like a motor truck; the engine speed is varied by spark and throttle control; gear shift is made by lever, and the clutch is actuated by pedal control. Of course, the operator is relieved of steering; when a wheel is provided, it is used to operate one set of brakes. Most rail cars are provided with air brakes.

**Unit Containers.** In freight transportation, containers usually thought of as individual boxes, which can be loaded and sealed by the shipper and transported to the consignee on motor-truck chassis, freight car, boat, or all three, without disturbing the contents, offer great possibilities in the coordination of all transportation facilities and the expediting of freight movement. Some motor-truck manufacturers supply special chassis for handling unit containers, in which mechanism actuated by the engine to facilitate moving them is incorporated in the truck chassis. The demountable body in its various forms was in some use in many parts of the country. It is probably more adaptable for general purposes of motor cartage than the unit goods container.

**American Motor Vehicle Industry.** The magnitude of the motor vehicle industry can be grasped by considering a few production figures for 1923. It is stated that in the United States over 3,636,500 passenger cars were produced; of this number 80 per cent of the output were cars selling at less than \$1000. Of all these cars, 33 per cent were closed models. Over 300,000 motor trucks were built, and 45,000 motorcycles were delivered. The growing use of the tractor is reflected by a production of 125,000. The number of cars in use can be realized by the production of tires; 40,000,000 shoes and tubes were needed to supply the demand. That the United States was very much in the lead in producing motor vehicles is evident from a comparison of its production with that of Europe. France produced 125,000 passenger cars and trucks; England, 78,000; and Germany, 35,000 motor vehicles. One American manufacturer, Ford, produced more automotive vehicles in a month than the 80 manufacturers of France did in a year, with the English production thrown in for good measure; over 200,000 cars and trucks have been turned out of the Ford shops in 30 days.

In 1912, 356,000 passenger cars were built, with a total value of \$335,000,000. In 1923, the 3,636,500 passenger cars had a value of \$2,250,000,000 in round numbers. In 1912, 22,000 motor trucks valued at \$43,000,000 were made. In 1923, 376,257 trucks valued at \$267,500,000 were produced. It was stated by *Automotive Industries* in its statistical number for 1924 that 18,241,477 cars and trucks were in use in the world, and of this number over 15,000,000 were in use in the United States. A few figures will be of interest in showing how the automotive industry helps other industries. In 1923, 41,400,000 square feet of plate glass was built into automobile bodies and windshields. Of leather and imitation leather, 246,840,000 square feet was used; upholstery cloth consumption was 18,585,600 yards. The industry used 32,089,200 square feet of top material.

The automotive consumption of steel in its

various forms was 11 per cent of the total tonnage and 16 per cent of the total output value. It is stated that 3,470,000 tons of steel, valued at \$300,038,000, were used. Each of the States of California, New York, Ohio, and Pennsylvania has over 1,000,000 cars and trucks registered; New York leads with 1,214,642 registrations, and California follows closely with 1,100,283. In spite of these staggering figures, the saturation point did not appear to have been reached by 1924. Reckoning the life of the average motor vehicle at five years, the industry would have to produce over 3,000,000 motor vehicles every year just to replace those worn out in service. Over 2,750,000 persons are employed in the motor vehicle industry and closely allied lines. The gasoline consumption for 1923 was 5,404,184,000 gallons. To keep the vast number of automotive vehicles in repair there are over 70,000 service stations and repair shops. Nearly 50,000 car and truck dealers supply the demand for vehicles, and 66,000 supply stores take care of the demand for accessories. Nearly every suburban home of persons in moderate circumstances now has either a one- or two-car garage, and over 50,000 large public garages are needed in the United States to provide storage facilities for people living in congested areas. See INTERNAL-COMBUSTION ENGINES; ARTILLERY.

**MOULTON, ARTHUR WHELOCK (1873- )**. An American bishop, born at Worcester, Mass., and educated at Hobart College, the General Theological Seminary, and the Episcopal Theological School. He was ordained a priest in the Protestant Episcopal Church in 1901. From 1900 to 1918 he was curate and rector of Grace Church, Lawrence, Mass. He served in the War as a chaplain in the field artillery and at a base hospital in France. In 1920 he was consecrated bishop of Utah. He wrote *Memoir of Augustine H. Amory* (1909), and *It Came to Pass* (1916).

**MT. EVEREST.** See EXPLORATION, *Asia*.

**MT. HOLYOKE COLLEGE.** A college for women at South Hadley, Mass., founded as a seminary in 1837 and given the college charter in 1888. The enrollment increased from 796 in 1914 to 864 in 1918, dropped to about 800 for each of the succeeding years until 1923-24, when it rose to 946. The faculty increased from 114 to 134 members during the decade. The library grew from 64,000 volumes in 1916 to 82,852 in 1924. A \$3,000,000 endowment fund was nearly achieved. The student-alumnæ hall, containing an auditorium, banquet rooms, committee rooms, etc., was built in 1916; Williston Hall, the biological building burned in 1917, was replaced by a temporary building in the next year and by a new permanent building in process of construction in 1923-24. Two new dormitories were built in the latter year, one to replace Rockefeller Hall, which was destroyed by fire in December, 1922. In 1919 an alternative method of matriculation by comprehensive examinations as well as by examination in individual subjects was instituted, and the former method of matriculation by certificate from approved schools was discarded. In 1923, a general examination in the senior year on work in the major subject was made a prerequisite of graduation. President, Mary Emma Woolley, A.M., LL.D., Litt.D., L.H.D.

**MOVING PICTURES.** The 10 years from 1914 to 1924 witnessed an extraordinary de-

velopment of the moving pictures, as an art, as an industry, and as an educational medium. Before 1914, the moving picture was regarded as a "freakish fad" which would enjoy its temporary period of popularity and would vanish; since then, the moving picture became firmly established as the only truly universal form of entertainment in the world. There is a steady increase in the number of theatres and of patrons, and in the number of schools, colleges, churches, and industrial corporations using the moving picture for educational purposes. There were in 1924 approximately 18,000 film theatres in the United States, with an average daily attendance of 12,000,000. In 10 days, the paid admissions at film theatres equal the total population of the country. The same figures, of course, do not apply to other countries, as the United States was actually the birthplace of the moving picture, and was furnishing in 1924 over 90 per cent of the world's supply of films. But in Europe, and particularly in Great Britain, France, and Italy, the popularity of the cinema was incredibly great. The gradual rehabilitation of Germany was resulting in increasing interest in moving-picture exhibition and production. South America and Japan were both enormous fields for the distribution of pictures. In Australia, it was estimated that half the total population attended the film theatres every week, a higher average, unquestionably, than in any country outside the United States.

The centre of moving-picture production was established in Los Angeles, Cal., in 1914, and that city, together with its suburbs, notably Hollywood and Culver City, attracted most of the large producing units. New York City, always the financial centre of the industry, was second to Los Angeles in point of production, although in later years there was a marked tendency to move the studios nearer to the source of capital. The number of producing units outside these two localities was negligible.

There are six stages in the preparation of a moving picture. First, its story is purchased from the author; secondly, it is adapted to the screen by a continuity writer; thirdly, the director and the cast are chosen; fourthly, it is actually photographed in the studio and at suitable exterior locations; fifthly, it is assembled in crude form and equipped with "subtitles" or "captions"; sixthly, it is edited and cut down to the required length. The unit of moving-picture measurement is the "reel," which contains about 980 feet of film. Pictures may be of any length, from 1 reel to 12, although 5, 6, or 7 reels is the average for so-called "feature pictures." The running time for one reel through a projection machine is approximately 12 minutes. The film itself is manufactured of a standard size and material so as to be available for use in projection machines in all countries of the world. After the completion of a moving picture, it goes through three stages: exploitation, distribution, and exhibition. For purposes of distribution, the United States is divided into exchange districts. Copies of the pictures are delivered to the exchanges and are rented through them to the theatre owners for purposes of exhibition. This service is given at various fixed rates to the exhibitor, the rate depending on the assumed value of each picture and depreciating as time goes on and the picture assumes wider circulation. "First-run houses," theatres which show pictures which

have not been exhibited in their district before, sometimes pay as much as \$20,000 for the rental of a picture for one week. So high are the running expenses of such theatres that it is often necessary for them to take in \$25,000 a week at the box-office before they can declare a profit.

The amazing progress of the moving picture has depended almost entirely on the development of the photoplay as a medium of entertainment. It is through this form that the moving picture achieves its widest popular appeal. The original photographs are made not only in the large moving-picture studios that have become so common, but it is often desirable to transport a company of actors long distances to make even one reel under the exact natural surroundings called for by the story to give it a proper historical setting. Thus, some films have been made in the desert of Sahara, in the South Seas, or in the most inaccessible portions of the Alps. Examples of pictures thus produced were *If Winter Comes* (England), *Ben Hur* (Italy), *The Arab* (Tunis), *The White Sister* (Italy) and *The Bright Shawl* (Cuba). All these were made by American producing companies, with American actors and American technical staffs. The first photoplays were one or two reels in length, but with the production in 1912 of *Queen Elizabeth* and *The Prisoner of Zenda*, the vogue of the "feature film" commenced. From then on, it became necessary to protract all photoplay stories to five reels, or about 5000 linear feet of film, whether the conditions warranted it or not. Victor Hugo's *Les Misérables* and Rudyard Kipling's *A Man There Was* had to be shortened and lengthened, respectively, until they approached a common size. In 1915, however, David Wark Griffith revolutionized all the theories of motion-picture production with *The Birth of a Nation*, which was the first multiple-reel photoplay. He proved that one picture could provide an entire evening's entertainment, and that the public would pay as much to see it as they would pay to see a play on the speaking stage. Consequently, *The Birth of a Nation* paved the way for a great flood of 8-, 10- and 12-reel pictures. Another type of photoplay, the serial, came into popular favor at this time. The serial is presented in episodic form, two reels at a time, and is usually melodramatic in nature, so that the suspense will be carried over from week to week. Most serials average 30 reels in total length, although several have materially exceeded that number.

The development of the photoplay has rested with a few genuine artists and a host of imitators. Griffith, in *The Birth of a Nation*, introduced the first battle scenes, and his pictures of the Civil War served as models for all the war pictures made between 1914 and 1919. Mary Pickford's popularity inspired countless golden-haired ingenues, just as Charlie Chaplin caused all film comedians to adopt black mustaches and grotesque shoes. William S. Hart was responsible for the Wild West cowboy melodramas, and Douglas Fairbanks for the acrobatic-hero farce-comedies. When George Loane Tucker produced *The Miracle Man*, he promoted a wave of religious enthusiasm in the films. The success of Theda Bara in *A Fool There Was* started the "vampire" craze which lasted for several years. In the same way, the demand for "mother-love" themes originated with *Humoresque* and for symbolism with Griffith's *Intolerance*. The Richard Barthelmess picture, *Tolable*

*David*, created a vogue for rugged mountaineer dramas; Rex Ingram's production, *The Four Horsemen of the Apocalypse*, inspired many imitators to dwell on the terrible ravages of war; and *The Covered Wagon* promoted a revival of interest in the pioneer days when the West was first settled. After the War the screen reflected the general trend toward realism, and so-called "costume dramas" in historical settings fell into popular disfavor. But then, for the first time in seven years, films were imported from Germany, and they tended to reverse the situation. The first of these, *Passion*, was based on the story of Madam DuBarry and the French Revolution, and it was followed by a number of others, including *Deception*, *Gypsy Blood* and *The Loves of Pharaoh*—all costume dramas. Not all of these German pictures were successful financially, but they inspired many American producers to attempt photoplays of a historical nature. Examples of films that demonstrate this influence are Douglas Fairbanks's *The Three Musketeers* and *Robin Hood*, and Griffith's *Orphans of the Storm* and *America*.

The Germans also introduced a distinct innovation, the futuristic photoplay, as exemplified by *The Cabinet of Dr. Caligari* and *The Golem*. These two pictures proved that the effect of a supernatural story may be vastly increased by the use of weird, impressionistic settings. They disclosed a fourth dimension on the screen. The great possibilities of the screen as a medium for the development of fantasy were demonstrated with startling effect by Douglas Fairbanks in *The Thief of Bagdad*. It was also proved in a number of notable productions that a moving-picture camera could photograph the subtler emotions, and that screen drama could be derived from the minutest details as successfully as from the most stupendous pictorial effects. A whole new school of moving-picture direction arose as a result, and its products were increasingly in evidence. In this way, the moving picture again invaded the particular province of the stage. *The Dramatic Life of Abraham Lincoln* represented the first attempt at a biography on the screen. It told the story of Lincoln's life with no superficial fictional frills added, and its success attested the popularity which this sort of narrative might achieve. It will be seen that the photoplay is rapidly emerging from its early limitations. It no longer depends on swift-moving melodrama, violent action, and expansive scenic investiture; it is relying more and more on delicacy and subtlety; it is delving deeper into the profundities of human emotion.

While the photoplay has effected substantial progress, other moving-picture forms have not stood still. The number of non-dramatic films produced each year is increasing at an enormous rate. Several companies are devoted exclusively to the production of travel pictures, which form a regular feature of almost every programme. One of these, *Nanook of the North*, was released as a regular "feature" and achieved considerable popularity. Showing the life of the Eskimo, it possessed anthropological as well as geographic value, and served to concentrate interest on the possibilities of this type of film. Yale University produced an inclusive history of the United States, in short installments, picturing all the major events from the landing of Columbus to the present; the educational value of such a work is obvious. The story of the Bible

has been similarly set forth on the screen. Moving pictures have been used widely by the various "Safety First" movements, by the Boy Scouts, by charitable institutions, by boards of trade, by anti-tuberculosis crusaders, by the Young Men's Christian Association, and by departments of the United States government for purposes of propaganda or public instruction. They are exhibited regularly in many prisons for the entertainment and diversion of the inmates. The most important field for moving pictures, aside from the photoplay, is the recording of news events. Every theatre includes a "news reel" on every bill, and the preparation of these pictures entails great expense and much work in all parts of the world. A fairly complete record of the War was made by the thousands of cameramen who followed the armies and navies and will remain as a historical document of vast importance. Four weeks after the Japanese earthquake, in September, 1923, pictures of the devastation caused by it and of the subsequent relief work were being shown all over the United States. During the War aeroplane photography was developed extensively because of its obvious military value. The moving picture was used to record the effects of shell fire, enemy operations, and strategic positions. Similar strides were made in submarine photography. By placing a camera in a water-tight compartment, which is lowered into the water, pictures of submarine life were made at great depths.

Since the invention of the moving picture and the realization of its practicability, scientists and engineers have concentrated on two developments: color photography and the synchronization of pictures and sound. Both of these problems have proved extremely difficult of solution, and neither has as yet approached perfection in its solution. Many color processes are in use, but none of them is really adequate, and all are expensive. The necessity of employing only two primary colors, on either side of the film, has placed a distinct limitation on this form of photography, and while certain colors, notably reds, may stand out effectively, others, notably natural greens, will present a false and washed-out appearance. Hand coloring has been employed at various times, but this process is slow, arduous and prohibitively costly. At the coronation of King George V, and the subsequent Durbar in India, Charles Urban made moving pictures with the Kinemacolor process; but these were crude and productive of considerable eye strain. Following this, color was used only in travel pictures and in the photography of rare flowers, birds, or precious stones. The first full-length photoplay to be made entirely in color was *The Glorious Adventure*, a costume drama of the Restoration period in England, which failed of substantial success. With the development of the Technicolor process, color photography made a distinct advance, and this has been used successfully in several pictures, notably *Toll of the Sea*, *the Ten Commandments*, and *Wanderer of the Wasteland*. Considerably less progress was made in the perfection of talking-moving pictures. Edison's kinetophone, (q.v.), first put before the public in 1912, was an almost total failure, as were the devices developed by Gaumont and Clermont-Huet in Europe at the same time. All these processes attempted to achieve synchronization between pictures and sound by means of a phonograph at-

tached to the controlling current of the projection machine. More recently Dr. Lee De Forest made successful experiments in photographing the human voice, converting sound waves into light waves, and so reproducing them on film. This discovery led him to the development of the Phonofilm, on which are photographed both the pictures and the sound at the same time. When run through the projection machine, the light waves are converted back into sound waves and transmitted through a microphone, so that the synchronization is necessarily perfect. No attempt has been made to produce a full-length picture with this process, but it has been used successfully in transcribing short speeches and in reproducing musical scores. Dr. De Forrest made a complete record of the musical score of *The Covered Wagon* and reproduced it on the film itself, so that the picture might be shown with its own orchestral accompaniment.

In 1909 the National Board of Censorship was organized for the purpose of regulating the moral tone of photoplays. This was a voluntary, unofficial group, with no legal standing, and was formed by the moving-picture producers themselves. With the advent of official State and municipal censorship, the National Board was rendered obsolete; local governments took its work into their own hands. Seven States enacted moving-picture censorship laws (Pennsylvania, Ohio, Kansas, Maryland, Florida, Virginia, New York), and similar measures were adopted in numerous cities and towns. Censorship became a formidable menace, in view of the fact that different standards obtained in different localities. There have been cases of the total rejection of a picture in one State and its approval, unchanged, in another. Often pictures are so materially cut by censor boards as to make them utterly unintelligible. Thus, photoplays must frequently undergo radical revision every time they pass a State line. This situation, of course, has worked great havoc on the moving-picture industry, and determined efforts have been made to defeat censorship bills wherever they have been proposed. With this idea in mind, the Motion Picture Producers' and Distributors' Association was formed in 1922, with Will H. Hays as its president. Since then, moving-picture censorship has gained no ground. It was decisively defeated by popular referendum in Massachusetts in 1922 and has been effectually kept out of the statute books in 14 other States since then. In the meantime, the Hays organization coöperated extensively with women's clubs and civic organizations in an effort to censor moving pictures from within.

The moving-picture play as a distinct artistic form grew out of the moving picture in much the same way as the regular drama developed from the crude mimicry of early times. The process of evolution in the one case, however, occupied only a few years, while in the other it extended over centuries. Just as the most primitive forms of drama were probably no more than rude attempts to portray or caricature actual events in the lives of persons and animals, so the first moving pictures were mere photographic transcripts from life, with little or no attempt at artistic arrangement.

But when the public had once become accustomed to the novelty of the moving picture there was a natural falling off in attendance at the places of exhibition, and it became necessary to invent some further means of entertainment.

The exhibitors hit upon the obvious device of telling a story by means of the pictures. At first the attempts were confined largely to broad comedy or farce of the slap-stick variety; but the popular success of these crude efforts opened the eyes of both public and producers to the artistic possibilities of the new form of entertainment, and photographic dramatizations of popular stories and plays began to appear.

These attempts at story-telling were decided improvements over the original pictures. They were far from satisfactory, however, because the producers had not yet realized that a new technique was necessary and were trying merely to duplicate the effects of the legitimate stage. It was only after long experiment that the advantages and limitations of the art as a distinct form revealed themselves and the moving-picture play as we know it to-day was evolved.

Technically the new form is perhaps more closely related to pantomime than to drama. There is this essential difference, however: in pantomime we accept the convention that there is a race of beings whose natural language is gesture and who are therefore capable of expressing all their thoughts and emotions without the assistance of words, while in the motion picture we imagine the characters to be speaking as in ordinary life though, by convention, we are unable to hear them.

It is this convention of silence which has imposed the chief limitations on the moving-picture play as an artistic form. So long as the characters in the moving-picture play can express nothing that cannot be conveyed by means of gesture or facial expression the moving-picture playwright would naturally be limited in the choice and treatment of his theme to the more elemental emotions. The moving-picture play does not, as a rule, therefore, attempt to deal in psychological subtleties or nice shades of character, but relies for its effect mainly on plot, as does the pantomime. It has an advantage over pantomime, though, in its use of captions or leaders. These are printed matter—inscriptions, letters, dialogue, headings, etc.—thrown on the screen to explain a scene or sequence of scenes that would not be intelligible from the acting alone; but the tendency, however, is to dispense with these devices wherever possible and allow the story to unfold itself in action. Nevertheless, as noted above, there were signs in the latter part of the decade under review that the motion picture could enter further into the psychological domain than had been supposed, and there were a number of film productions in 1923 and 1924 which by the skillful use of suggestive detail and by a more confident appeal to the imagination of the audience vied with the best of the stage plays in expressing the subtler emotions.

In structure the moving-picture play follows the Elizabethan rather than the modern tradition. Change of scene is frequent, and there is no obligation on the part of the playwright to arrange the events of his story so as to fall into the ordinary divisions of time and space which is obligatory to the contemporary legitimate dramatist. If in the course of the play some of the characters move from Europe to America, the spectators may take passage with them and witness the events on the journey; if the hero and heroine steal into the garden for five minutes, they may follow and see precisely what

happens instead of trusting their report when they return to the drawing room. This flexibility of form lends an impression of greater continuity in action and makes possible a wealth of detail and added air of veracity that renders the moving-picture play a dangerous rival to the type of regular drama in which character and psychology are subordinate to plot. Already there is a tendency on the part of writers of melodrama to imitate the dramaturgy of the moving-picture play.

It is in connection with the representation of dramatic scenes in the form of so-called photoplays that the moving-picture industry finds its widest application. Depicting current events in this way of course aroused interest, but this does not bulk large in connection with the portrayal of successive scenes from some new or standard play in which the action follows along rapidly and emphasizes the dramatic succession of incidents. This involves the reduction of a play to a simple scenario or story, or it may be the construction of a scenario or outline from new and original ideas. Once this is done the work of staging and photographing the scenes must be started. This involves large expense and considerable time, as many of the situations may be modified as the work proceeds, to give them proper dramatic value and effect. For production on the large scale that is now necessary, when moving-picture plays as regards not only elaboration but even in prices charged for admission and seats are in some cases put on a level with actual stage productions, extensive workshops and large studios are increasingly common. Several photoplays may be in process of production simultaneously, and a large force of costume makers, scene painters and other assistants are employed, together with the necessary workshops for developing and finishing the films as rapidly as possible. The expense for the duplication of a film, once it is made, is not large proportionately, and as soon as films are released for rental the profits, according to the popularity of the subjects, are very large. When a film has been made and found satisfactory for exhibition it is imprinted with the name of the manufacturer and copyrighted. A film may be run about 500 times in the hands of a careful operator before its condition renders its projection unsatisfactory by reason of streaks and spots that appear greatly magnified upon the screen; in addition to which there is a certain increased fire danger from the frayed and split condition of the edges when exposed to the intense heat in front of the lantern.

**MOWRER, PAUL SCOTT** (1887- ). An American newspaper correspondent, born in Bloomington, Ill. He studied at the University of Michigan and began his newspaper career as a reporter in Chicago, in 1905. He was a correspondent at the front in the 1st Balkan War and again in the War in Europe from 1914 to 1918. In 1921 he acted as special correspondent of the Disarmament Conference. He wrote *Hours of France*, poems (1918), and *Balkanized Europe—a Study in Political Analysis and Reconstruction* (1921). He also contributed many articles to magazines on world politics.

**MOZAMBIQUE.** See PORTUGUESE EAST AFRICA.

**MUDANIA, ARMISTICE OF.** See PEACE CONFERENCE AND TREATIES; SMYRNA; TURKEY.

**MÜLLER, GEORG ELIAS** (1850- ). A German psychologist. He completed his analysis of memory (*Analyse der Gedächtnis Stätigkeit*) in 1917. As representative of the associationistic school, he opposed the relativistic notions of the proponents of the *Gestaltpsychologie* (see PSYCHOLOGY, Perception). His book on *Complextheorie und Gestalttheorie, ein Beitrag zur Wahrnehmungs Psychologie* (1923), is a defense of associationism against its critics.

**MÜLLER, HANS** (1882- ). An Austrian writer and dramatist, born at Brunn, and educated at the University of Vienna. He traveled extensively in Germany, Austria, Italy, France, Belgium, Holland, and England. He is the author of *Dämmer* (1900); *Die Lockende Geige* (1903); *Der Garten des Lebens*, a Biblical epic (1904); and *Die Rosenlaube* (1909), all verse. He also wrote several volumes of fiction, among them *Buch der Abenteuer* (1905), *Geheimnissland* (1909), and *Träume und Schäume* (1911), besides a volume of sketches, *Die Kunst Sich zu Freuen* (1917). His reputation rests chiefly on his plays, which include: *Das Wunder des Beatus* (1910); *Gesinnung* (1912); *Der Reizende Adrian* (1913); *Die Blaue Küste* (1914); *Könige* (1915); *Violante* (1916); *Der Schöpfer* (1918); and *Die Sterne* and *Die Flamme* (1920).

**MÜLLER-FREIENFELS, RICHARD** (1882- ). A German writer, born at Ems, and educated at the universities of Munich, Berlin, Geneva, Tübingen, Paris, London, and Zurich. He traveled in Europe, Asia, and Africa. His works include: *Psychologie der Kunst* (1912); *Deutsche Denker und die Phantasie* (1916); *Persönlichkeit und Weltanschauung* (1918); *Psychologie der Religion* (1920); *Philosophie des Individualismus* (1920); *Psychologie des Deutschen Möglichen* (1921); *Bildungsideen und Erziehungsmöglichkeiten* (1921); and *Irrationalismus* (1922).

**MÜLLER-URY, ADOLFO** (1864- ). A Swiss-American portrait painter (see VOL. XVI). He painted a portrait of Mrs. Woodrow Wilson (1916); of President Wilson delivering his "war speech" before Congress on Apr. 3, 1917; of Cardinal Mercier, during his visit to the United States, for the Catholic University at Washington; of Pope Pius XI in 1922, and many others.

**MUNDELEIN, GEORGE WILLIAM** (1872- ). An American cardinal, born in New York City, and educated at Manhattan College, St. Vincent Seminary, and in Rome. He was ordained priest in 1895 and served as associate secretary to the bishop and as pastor in Williamsburg, Pa., from 1895 to 1897. From the latter year until 1909 he was chancellor of this diocese. In 1903 he was appointed censor of the Liturgical Academy, the only American holding that office. In 1906 he received the appointment of domestic prelate and in 1909 was appointed titular bishop of Loryma and auxiliary bishop of Brooklyn, N. Y. He held this office until 1916, when he was made archbishop of Chicago. In 1924 he was elevated to the rank of cardinal.

## MUNICIPAL GOVERNMENT.

The outstanding feature in municipal government from 1914 to 1924 was the rapid advance of the commission-manager plan, which was only fairly well started at the beginning of 1914. A rapid increase was made in numbers and population of incorporated places in the United States; their services, rendered at public expense, were continually augmented; and there was a consequent increase in municipal expenditures, indebtedness, and tax rates. All three increases were accelerated by the War and post-war conditions during the 10 years. No true picture of these increases can be gained without taking into account the diminished purchasing power of the dollar and the greatly increased commodity and construction cost index. Besides the movement of cities toward the adoption of the commission-manager city charter, other changes were made, to effect more efficient municipal government and at the same time to make it more responsive to the wishes of the people. Where the commission or the commission-manager plan, with its small governing body, had not been adopted, there were many changes to councils of much smaller size than formerly, with abolition also of the bicameral or two-chamber city council where that was still in existence. The most notable example was the substitution at Philadelphia on Jan. 1, 1920, of a single council of 21 members for the old double-chambered council of 144.

The census of 1920 showed that the 50 largest cities of the country had a population of nearly 38,000,000. The 50 largest cities of the United States in 1870 had a total population of 5,773,000, or only 153,000 more than the population of New York in 1920. In 1870 the United States had only 14 cities of 100,000 population or more, compared with 68 in 1920. Up to and including the census of 1870 the dividing line between urban and rural population was 8000. By 1880 urban life had become so much more intense that the urban classification was extended to embrace all incorporated places of 2500 population and over, and all towns of that size, in certain New England States. On this basis the urban population of the United States on Jan. 1, 1920, totaled 54,300,000, or 51.4 per cent of the entire population of the country; these people lived in 2787 places. Smaller in-

corporated places, each functioning municipally to a greater or less degree, numbered 12,905 in 1920 and had a population about 9,000,000. For 1924 it is safe to assume some 16,000 incorporated places with a total population of about 65,000,000, or nearly 60 per cent that of the entire country. A preliminary statement by the Bureau of the Census reporting taxes collected in 1922 and 1912 shows that incorporated places of more than 2500 population collected a total of \$1,532,000,000 taxes in 1922 against \$850,000,000 in 1912, an increase of 80 per cent. The corresponding figures for taxes levied by counties are \$745,000,000 and \$308,000,000, an increase of 142 per cent. The net debt of cities (gross-debt sinking-fund assets) for all incorporated places in the United States was \$4,709,000,000 or \$70.80 per capita in 1922, against \$2,885,000,000 or \$54.07 per capita in 1912.

**Charters and Municipal Home Rule.** One by one the various State Legislatures of the Union have given up the early and long-prevailing practice of enacting separate charters for individual cities. In some places it is still within the power of a Legislature to do this, although the power is rarely exercised. A number of State constitutions prohibit all legislation applying to one city only. Some years ago New York State made such legislation subject to local veto by the mayor or in smaller places by the local legislative body. New York in 1914 and Massachusetts in 1915 passed optional charter acts under which municipalities can by popular vote choose between six types of charter in New York and four types in Massachusetts. The three main types in each State are the federal or mayor-and-council type, with varying degree of separation between legislative and executive functions; the commission plan, and the commission-manager plan. In 1915 the voters of New York State defeated municipal home-rule amendments to the State constitution which had been drawn by a constitutional convention. After persisting in an attempt to the same end, New York State in 1924 became the thirteenth in the Union to grant more or less extensive home-rule powers to its municipalities. The New York home-rule constitutional amendment was adopted by a popular majority of 426,000 at the November election in 1923. The necessary enabling act specifying the details of home-rule powers and methods of exercising them was passed by the Legislature of 1924 and ap-

proved by Governor Smith on April 24. The amendment added several sections to Article XII of the New York State constitution, which makes it the duty of the Legislature to provide for the government of municipalities.

The Enabling Act (Chapter 363, Laws of 1924) extends broadly to all kinds of strictly local legislation, including the making and amending of municipal charters, but leaves unaltered the power of the Legislature to pass certain kinds of laws applicable to all municipalities. The amendment also authorizes the Legis-

lature to pass special legislation by a two-thirds concurrent vote of each house, on receipt of an emergency message from the Governor. Every city is granted constitutional "power to adopt and amend local laws not inconsistent with the constitution and laws of the State." These laws may relate to a wide range of subjects. The amendment makes it the duty of the Legislature to provide by general law for putting the amendment into effect. The Enabling Act authorizes any local legislative body to pass local acts superseding existing State legislation applying to the municipality in question alone. The act makes compulsory a referendum vote on certain charter changes and local ordinances such as those changing the veto power of the Mayor, creating a new executive office, abolishing a branch of the legislative body, or alienating city property. Other kinds of local acts are subject to referendum on petition. Provision is made for local drafting of new charters. The municipal assembly is prohibited by the Enabling Act from passing any law removing or raising debt or tax limits and various other matters retained under State control. In the case of New York City and in recognition of the large legislative powers vested in the Board of Estimate and Apportionment, the Enabling Act gives the power to enact local laws to a bicameral body known as the Municipal Assembly, consisting of the Board of Estimate and Apportionment and the Board of Aldermen. Before they are approved by the Mayor, he must give a hearing on all local laws passed by the Assembly. The Mayor's veto of such laws may be reconsidered by the Municipal Assembly and passed over the veto by a two-thirds vote. On reconsideration the Mayor is not allowed to vote. The New Jersey Legislature of 1923 granted to any municipality in that State the right to adopt the commission-manager form of city charter. A plain commission plan enabling act was passed some years earlier and had been widely

adopted in the State, but repeated efforts to secure the manager plan were defeated.

**Rapid Progress of City-Manager Plan.** Up to 1914 the city-manager plan had been adopted by only 23 municipalities; the first of these was Staunton, Va., which created the office of business manager by ordinance in 1908. From 1915 on, there was first slow and steady and then more rapid progress in the adoption of the manager plan. The official *Year Book of the City Managers' Association* for 1924, revised to March 15, showed that 319 municipalities in the United States and Canada and 7 in foreign countries had adopted the manager plan. Of the 319 cities, 246 had adopted the plan by charter and 73 by ordinance. The charter method is considered the better of the two because it is more stable and rests on the referendum vote.

The population of cities operating under the city-manager plan in 1924 was nearly 5,000,000 in the United States, 130,000 in Canada and 470,000 in other countries. The largest American city under the plan was Cleveland, Ohio, with a 1920 population of 797,000. Other American manager cities with populations in excess of 100,000 in 1920 were: Norfolk, Va., 159,000; Dayton, Ohio, 153,000; Grand Rapids, Mich., 137,000. By far the larger number of manager cities are relatively small. The largest foreign city listed in the *Year Book* already mentioned is Leeds, England, with a population about 430,000. The total number of manager cities given does not include those that have abandoned the plan. Of these, there are altogether 76 that were reported as having adopted the plan, but of that number the reports were unfounded in many cases. Of the 76 cities, 72 either never really adopted the plan or else adopted and abandoned it under ordinance. The plan has been abandoned by only 4 cities that adopted it under charter. The largest of these was Akron, Ohio, which adopted a manager plan not wholly as standard in 1920 and gave it up four years later. The other charter cities which abandoned the manager plan are Waltham, Mass., Hot Springs, Ark., and Lawton, Okla.

Promotions of city managers have been common, with 72 instances. Up to Mar. 15, 1924, the *Year Book* already cited states that 259 managers were serving in their first cities, 30 in their second, 5 in their third, 5 in their fourth, and one in his fifth. The other 13 of the 72 promotions were of men not now following the profession of city manager. The leading managers command high salaries, not always proportioned to the population of the city. There were, however, many managers giving good service at modest salaries. In 14 cities the salaries paid to managers were \$10,000 or over. Cleveland, Ohio, where the plan went into effect Jan. 1, 1924, pays \$25,000 a year. Norfolk, Va., and Stockton, Cal., pay \$20,000; their respective populations in 1920 were 159,000 and 40,000. In the \$15,000 class were Knoxville, Tenn., with a population of 78,000, and Sacramento, Cal., with a population of 66,000. Pasadena, Cal., and Lynchburg, Va., pay \$12,000 a year. The cities in the \$10,000 class were Long Beach, Cal.; Miami, Fla.; Dubuque, Iowa; Portland, Me.; Beaumont, Texas; Petersburg, Va.; and Bluefield, W. Va. The last named had the smallest population of any in the \$10,000 class—16,000.

See CITY PLANNING, GARBAGE, MUNICIPAL OWNERSHIP, SEWERAGE, WATERWORKS.

#### CITY MANAGER CITIES

(From *The City Manager Magazine*, April, 1924.)

The following represents the growth of the manager plan by years:

| Put in effect | By charter | By ord. | Total |
|---------------|------------|---------|-------|
| 1908 .....    | 0          | 1       | 1     |
| 1912 .....    | 1          | 2       | 3     |
| 1913 .....    | 8          | 3       | 11    |
| 1914 .....    | 15         | 6       | 21    |
| 1915 .....    | 13         | 7       | 20    |
| 1916 .....    | 15         | 5       | 20    |
| 1917 .....    | 13         | 5       | 18    |
| 1918 .....    | 20         | 8       | 28    |
| 1919 .....    | 20         | 11      | 31    |
| 1920 .....    | 23         | 12      | 35    |
| 1921 .....    | 41         | 7       | 48    |

| 1923 .....    | 40         | 8       | 48    |
| 1924 .....    | 6          | 1       | 7     |
| 1925 .....    | 1          | 0       | 1     |
| 1926 .....    | 1          | 0       | 1     |
| Totals .....  | 245        | 86      | 331   |

lature to pass special legislation by a two-thirds concurrent vote of each house, on receipt of an emergency message from the Governor. Every city is granted constitutional "power to adopt and amend local laws not inconsistent with the constitution and laws of the State." These laws may relate to a wide range of subjects. The amendment makes it the duty of the Legislature to provide by general law for putting the amendment into effect. The Enabling Act authorizes any local legislative body to pass local acts superseding existing State legislation applying to the municipality in question alone. The act makes compulsory a referendum vote on certain charter changes and local ordinances such as those changing the veto power of the Mayor, creating a new executive office, abolishing a branch of the legislative body, or alienating city property. Other kinds of local acts are subject to referendum on petition. Provision is made for local drafting of new charters. The municipal assembly is prohibited by the Enabling Act from passing any law removing or raising debt or tax limits and various other matters retained under State control. In the case of New York City and in recognition of the large legislative powers vested in the Board of Estimate and Apportionment, the Enabling Act gives the power to enact local laws to a bicameral body known as the Municipal Assembly, consisting of the Board of Estimate and Apportionment and the Board of Aldermen. Before they are approved by the Mayor, he must give a hearing on all local laws passed by the Assembly. The Mayor's veto of such laws may be reconsidered by the Municipal Assembly and passed over the veto by a two-thirds vote. On reconsideration the Mayor is not allowed to vote. The New Jersey Legislature of 1923 granted to any municipality in that State the right to adopt the commission-manager form of city charter. A plain commission plan enabling act was passed some years earlier and had been widely

**MUNICIPAL LEAGUE, NATIONAL.** An organization founded in 1894 for the study of municipal problems and the dissemination of information on the subjects relating to them. The society was active in the decade 1914-1924. Annual meetings are held in different cities. The twenty-first meeting was held in Dayton, Ohio, in 1915. During this year several important volumes were published, including *Lower Living Costs in Cities*, by Clyde L. King; *The City Manager*, by H. A. Toulmin, Jr. In 1916 the meeting was held in Springfield, Ohio. There was an important discussion on the influence of politics in city government. Lawson Purdy succeeded W. W. Foulke as president. The meeting in 1917 discussed many other subjects, including the experience of American and Canadian cities during war time. A survey commission to examine different phases of municipal government was appointed, as was also a Conference of State Leagues of Municipalities to act as a separate organization. Lawson Purdy was reelected president. In this year the society published many other volumes, including *Municipal Functions*, by H. G. James. The session of 1918, held in New York City, gave the major part of its time to the discussion of various phases of Bolshevism. In November of the same year, a conference on reconstruction was held under the auspices of the society, in Rochester. In 1919 the meeting at Cleveland took the form of a moot constitutional convention, at which sundry questions on constitutional reform were discussed at length. Clinton Rogers Woodruff retired as secretary after twenty-five years of service. He was appointed honorary secretary. Hon. Charles E. Hughes was elected president at this meeting. In Indianapolis, in 1920, the society discussed the report of a commission on State government. President Hughes delivered an address on the fate of the direct primary. At this meeting the society voted to unite with the American Civic Association. H. W. Waite was elected president. A feature of the meeting in Philadelphia in 1922 was an address delivered by Albert Shaw on the history of the work of the society, entitled *A Thirty Years' View*. A committee on electoral reform was appointed at this session. At the meeting in Washington, in 1923, many phases of municipal government were discussed. Through its committee on State government it has prepared a Model State Constitution which was debated and accepted at three successive annual conventions. The constitution is published in pamphlet form with explanatory articles. The League has also prepared a number of pamphlets designed for classes in high schools, and many others on technical subjects. Its official organ is *The National Municipal Review*, monthly. The secretary is H. W. Dodds.

**MUNICIPAL OWNERSHIP.** Waterworks lead public utilities in percentage of plants under municipal ownership and even more markedly in percentage of population supplied. All of the 10 largest cities of the United States own their works. In the second group of 10 all but San Francisco and Indianapolis, and every one in the third group of ten, have them under public ownership. In cities ranging from thirty-first to fiftieth in population, all but six have municipally owned works. There are only nine examples of private ownership in the 50 largest cities of the country. In the second

group of 50 cities, only six have them under private ownership. Out of the 100 largest cities, 15 had private-owned works. No figures for the whole country have been compiled since those given in the *McGraw Waterworks Directory* for 1915. Of 4400 works there listed for the United States, a number probably too small to include all works then built, 3045, or nearly 70 per cent, were municipally owned. For Canada, figures published by the Canadian Conservation Commission in 1915 showed that of 528 waterworks, 396, or about 75 per cent, were under municipal ownership. In some of the provinces, all of the works were publicly owned. Denver, Colo., after many years of effort and agitation to that end, acquired its waterworks from private owners in 1918. San Francisco, which had also been struggling for municipal ownership for a long time, had not succeeded up to 1924 in taking over the distribution system, but had completed what was formerly known as the Hetch Hetchy Dam and now called the O'Shaughnessy Dam, to form a large impounding reservoir on the Tuolumne River. It also had well under way the construction of a large aqueduct from the reservoir to the city. (See **AQUEDUCTS AND DAMS**.) Extensive hydroelectric power development is a part of the project, and this is also true of the water supply brought to Los Angeles by a notable aqueduct. A notable event in 1923 was the transfer on December 15 to the city of Morristown, N. J., of the waterworks originally built in 1799 by the proprietors of the Morris Aqueduct. By this transfer there passed to municipal ownership the last of 15 privately owned waterworks in the United States built up to the close of the year 1800. On the date last named there was in existence only one municipally owned waterworks in the United States, at Winchester, Va.

Next to waterworks in public ownership in the United States stand electric light and power stations. A summary published in the *Electrical World* of Aug. 11, 1923, based on the 1923 edition of the *McGraw Central Station Directory*, shows that on Oct. 1, 1922, there were in the United States 5974 central station systems; of this number 2019, or 33.7 per cent, were municipally operated. The largest number of municipal central stations was reported from the west north central States, in which of 1460 stations, 693 were municipally operated.

Gas works in the United States make a very small showing for municipal ownership. According to figures compiled by the American Gas Association, based on the 1923 edition of Brown's *Directory of American Gas Companies*, of 966 gas works in the United States in 1923 only 51, or 5 per cent, were municipally owned, and the plants under municipal ownership supplied only 1.6 per cent of the total output of gas for the year to less than 2 per cent of the entire population supplied by gas; 662,000 population were supplied by municipally owned works out of a total of 45,000,000 people served. The 51 municipally owned gas works were located in 21 States, with six in Minnesota, five in Virginia, and four each in Georgia, Iowa, and Massachusetts. The largest of these was that supplying the Omaha metropolitan district in Nebraska; this was taken over by the district in 1920. The two next largest were at Richmond, Va., and Duluth, Minn.

Street railways are but rarely under municipi-

pal ownership in the United States, but more commonly in Canada, and still more generally in Great Britain. In point of magnitude of works and capital investment, the subways and other railways forming part of the rapid transit system of New York City lead the country. These, however, are privately operated, and so are the municipally owned subways and elevated lines of Boston and Philadelphia. Important extensions to the New York and the Philadelphia rapid transit systems were still under way and projected in 1924. Within the preceding decade, San Francisco, Seattle, and Detroit went extensively into municipal ownership of street railways. San Francisco had either built or acquired by purchase over 60 miles of single track up to June 30, 1923. Seattle on Mar. 1, 1919, took over by purchase from the Puget Sound Traction Light and Power Company 203 miles of railway track at a purchase price of \$15,000,000; this had been authorized by a popular vote of 4 to 1 in November, 1918. Detroit acquired an extensive street railway system.

In Canada, 15 municipalities have gone into municipal ownership of street railways. The entire street railway system of Toronto was under municipal ownership early in 1924 and some suburban lines also, although the latter were operated by the Ontario Hydro-electric Commission. Sewerage systems, though not usually regarded as a public utility, i.e. subject to private franchise and operation for private property, are owned by a few cities in the United States, the chief of which is Atlantic City; they are similarly owned in some foreign countries, as in the city of Valparaiso, Chile. The Public Ownership League of America, with national headquarters in Chicago, is devoted to the promotion of public ownership and democratic control of public utilities and natural resources and issues various bulletins on the subject.

**MUNICIPAL TAXATION.** See TAXATION IN THE UNITED STATES.

**MUNITIONS OF WAR.** See ORDNANCE.

**MUNSEY, FRANK ANDREW (1854- )**. An American publisher (see Vol. XVI). During the decade 1914-24 he was especially active in the newspaper field and established and acquired by purchase several newspapers, including the *Washington Times*, *Baltimore News*, *New York Sun*, *New York Globe*, *New York Mail*, *New York Evening Telegram*, and *New York Herald*. The last he sold in 1924 to Ogden Reid, who consolidated it with the *New York Tribune*.

**MURDOCK, VICTOR (1871- )**. An American legislator (see Vol. XVI). In 1917 he was appointed a member of the Federal Trade Commission. He was reappointed for the term expiring 1925. During the War he served as a member of the meat commission of the United States government. From 1914 to 1916 he was chairman of the Progressive national committee. He wrote *China, the Mysterious and Marvelous* (1920), and *Folks* (1921).

**MURMANSK COAST EXPEDITION.** See RUSSIA, *History*.

**MURRAY, (GEORGE) GILBERT (AIMÉ) (1866- )**. A noted English philologist (see Vol. XVI). He has published since 1914 *Stoic Philosophy* (1915); *Faith, War and Policy* (1918); *Euripides and His Age* (1918); *Satanism and the World Orders* (1920), and *Problems of Foreign Policy* (1921).

**MUSCLE SHOALS.** A location on the Ten-

nessee River 2.7 miles above the railway bridge at Florence, Ala., and a few miles from Sheffield. During the War the United States put under way a notable development there for the manufacture of nitrates for use in military explosives and also a large power plant involving the construction of a hundred-foot dam across the river. (See DAMS, *Wilson Dam*.) Under the terms of the National Defense Act of 1916 the site for the dam at this point was acquired, and in the following year United States Nitrate Plants No. 1 and No. 2 were planned, the latter directly at Muscle Shoals. This was done in order to secure an adequate supply of nitrate for the manufacture of munitions in case the United States should be cut off from the material imported from Chile. The reason for locating such plants at Muscle Shoals was the great power to be obtained from the Tennessee River, the fourth in size of the rivers of the United States, having a flow of 8000 to 500,000 cubic feet per second and in this vicinity a fall of over 134 feet in 37 miles. The Tennessee River is navigable from its mouth to the foot of Muscle Shoals, and the completion of the No. 2 or Wilson Dam at this point with its lock and the construction of No. 1 Dam, a small dam for navigation only two miles below the Wilson Dam, would extend navigation for a distance of 15 miles. The building of the proposed Dam No. 3, 50 feet high, would extend navigation 65 miles further and supply additional power. Up to 1924 navigation of the river had been slight, but much interest centred in the development of power, particularly at Dam No. 2, the Wilson Dam. Here for 12 months in the year there would be available 87,300 horse power and for 97 per cent of the time 100,000 horse power, while for 2½ months the available power would increase up to 600,000 horse power. The United States No. 2 Nitrate Plant at Muscle Shoals was completed so that operation could begin on Oct. 27, 1918, and it continued for a sufficient time after the Armistice to show that it could be run successfully. It had a capacity of 220,000 tons of cyanamid or 110,000 tons of ammonium nitrate per annum. This plant was of course operated by steam power; there is a 60,000 kilowatt steam-power plant at Muscle Shoals. Electricity was supplied over a 90-mile transmission line from a 30,000 kilowatt steam plant on the Warrior River. The plant at Muscle Shoals cost approximately \$70,000,000 and the Warrior River plant and transmission line about \$5,000,000 additional. The raw materials required for nitrogen fixation were coke from the Birmingham district or eastern Tennessee, limestone from the Waco quarry, 30 miles distant, and nitrogen from the air. The principal item was the cost of power; 85,000 kilowatts was required, and the steam plants were used pending the completion of the large dam across the river. The No. 2 plant could supply the nitrogen for 12 infantry divisions at the rate it was used in the War, or more than one-third of the inorganic nitrogen used in the production of fertilizers in the United States at this time. Consequently in the latter connection after the end of the War the farmers became interested in the utilization of the plant as an agency to increase the supply and decrease the cost of fertilizer. Accordingly after the War the future of this great power and manufacturing development became a matter of considerable debate. After a curtailment of construction

work on the Wilson Dam in 1921, it was decided to proceed vigorously with its completion, but no decision was reached as to the method of utilizing the power that would be developed, up to the autumn of 1924. Offers were made by Henry Ford, the Combined Power Companies, in which the Alabama Power Company was a leading interest, a Mr. Hooker, and the Union Carbide Company, all of whom submitted to the government detailed proposals of plans for the utilization of the present and future power resources, the manufacturing of fertilizer, and the conditions under which it would be sold. The Ford proposal for a while attracted much public attention, but it was not altogether favorable to the government according to many engineers. The various schemes were all under discussion in 1923 and 1924, but the question of disposing of the government-owned property at Muscle Shoals was not definitely decided at the session of Congress ending June 7, 1924, although at that time the sentiment was rather in favor of the government's retaining and operating the property than of turning it over to Henry Ford to operate. There also were changes in the aspect of preparedness in this field as well as in the production and cost of fertilizer materials so that the conditions seemed to indicate that the power consideration might be preëminent over other considerations.

**MUSIC.** At the outbreak of the War, futurism was just making its appearance, and the majority of musicians, as well as music-lovers, then regarded the new movement as an aberration of taste not worthy of serious consideration. The decade 1914-24, however, witnessed such a rapid and general spread of the new cult that futurism was no longer to be ignored. To understand the situation at the close of this period it is necessary to distinguish between impressionism and futurism. Impressionism began as a reaction against the all-pervading influence of Wagner. For the fundamental principle of thematic development the impressionists substituted the mere statement of themes, which followed one another in kaleidoscopic succession, without systematic repetition or development. But the necessity of themes as basic material was still recognized. The conscious employment of the higher overtones, while extending the possibilities of harmonic combinations and progressions for the attainment of special effects, was carried to excess from the very beginning, with the result that impressionistic music rests not on the foundation of consonance, which was formerly the foundation of all music, but on dissonance. Around Debussy as their leader, a group of younger composers sprang up who soon made a caricature of impressionism and whose tendencies were dubbed futurism. These innovators, dispensing altogether with thematic invention, employed mere rhythmical figures. Regularly defined rhythm was soon scorned as monotonous, and constant variation of rhythm was adopted as a fundamental principle. Different instruments played different rhythms simultaneously, so that each instrumental part was entirely independent of all the others. This brought with it the complete and intentional disregard of the harmonic relations of sounds. The preponderant use of dissonance by the impressionists had already obliterated the dividing line between euphony and cacophony, and now the futurists denied the essential difference between consonance and dis-

sonance, proclaiming a system of "free harmony" which permitted the combination and juxtaposition of all sounds, irrespective of relationship. This system frankly adopted cacophony as its basic principle. As compositions were no longer written in a recognizable tonality, key signatures disappeared and each accidental was marked individually, with the result that the printed page is as bewildering to the eye as the actual sounds to the ear. This method of writing soon became known as atonalism. However, some futurists insist on a distinction between atonalism, the negation of the diatonic scale and the triad, and polytonalism, the superposition or interlocking of various tonalities. Thus, in a string quartet by Casella the first violin plays in E $\flat$  minor, the second violin in B $\flat$  major, the viola in F $\sharp$  minor, and the 'cello in D minor. The constant change of rhythm quite naturally led to the abolition of time signatures and bar lines. The next step was the introduction of quarter-tones; the scores of Alois Hába were actually published in the new quarter-tone notation. The craze for novel effects also led to an abnormal augmentation of the mechanical means of sound-production. Orchestral instruments were exploited in unusual registers and in still more unusual combinations. As an extreme example of overloaded orchestration may be cited Schönberg's *Gurrelieder*, scored for 6 solo voices, 2 choruses of eight and 12 parts respectively, and 114 different orchestral parts—altogether 140 distinct parts! In the employment of this huge apparatus, Schönberg defeats his very purpose and produces less startling and grotesque effects than Stravinsky does in his *Histoire du Soldat*, scored for an absurdly inadequate orchestra of one violin, one clarinet, one bassoon, one cornet, one trombone, and several drums.

The outbreak of the War created conditions exceedingly favorable to the spread of futurism, especially in Europe. It happened that impressionism had already made great headway in Russia, England, and the Latin countries, whereas in Germany and Austria the traditions of the classic and romantic masters had proved an effective check against the new influence. With German music banished, or at least considerably curtailed, in all countries politically arrayed against Germany, the impressionists assumed undisputed leadership, and in their wake the futurists developed such an active campaign that in a very short time they succeeded to the dominating position. Debussy, who until the beginning of the War had been the acknowledged leader of the radicals or ultramodernists, was deposed as too conservative, and his place taken by the futurists Scriabin and Stravinsky. The futurists now became the ultramodernists, while the impressionists were relegated to the rank of mere modernists. In Germany and Austria the new gospel began to spread, and Schönberg, whose partisans before the War had made some futile attempts at recognition, suddenly found himself elevated to a place by the side of Scriabin and Stravinsky. As early as 1915 an Italian, Pratella, formulated the new futuristic creed: "Young composers, revolt against the tyranny of the publishers, the stupid presumption of the public, and the insipid gossip of critics all more or less bought. . . . Let us attack the prejudice for music that is well made, and despise that popular phrase, 'We must go back to older music.' . . . Let us destroy the

popular taste for old operas, whose exhumation encumbers the progress of new musicians. Let us compel the public, by assiduous propaganda, to be interested in all that teems with originality and revolution in music. . . . We hear on every side that we are fools. It is from the window of a glorious madhouse that we proclaim as an essential principle of our futuristic revolution that counterpoint and fugue, foolishly considered one of the most important branches of musical instruction, are no more in our sight than the ruins of the old science of polyphony that extends from the Flemish masters to Bach. . . . We declare, moreover, the values of consonance and dissonance as absolutely inconsistent. From innumerable combinations and from the diverse relations that result from them will arise the great futuristic melody. This melody will be simply the synthesis of harmony and in a way will resemble the ideal line formed by the continuous expanding of a thousand sea waves with irregular crests. . . . We have liked for a long time the enharmonic intervals produced by an orchestra that sounds out of tune in playing on diverse tonalities and that we hear in popular songs intoned without any knowledge of art. The rhythm of the dance will have to renounce the domain of polyphony for a free polyrhythmic manner. . . . The æsthetic intuition of the creative artist will be sufficient to balance the succession and alternation of all tempi and of all possible rhythms. . . . The musician ought to listen only to his soul singing in synthetic explanation of his musical ideas. . . . The purely symphonic composer writes at the pleasure of his fantasy, neglecting all principles and laws, to obey only the futuristic equilibrium. . . . We must be careful not to consider as absolute symphonic forms the traditional schemes of the symphony used to-day, which are decayed and surpassed. . . . We must express the musical soul of the multitude, of the great industrial factories, of trains, transatlantic steamers, warships, automobiles, and aeroplanes. We must add to the great dominant motifs of the musical poem the glorification of the machine and the victorious kingdom of electricity. . . . All this will become possible when conservatories, lyceums, and academies of music will finally be deserted and closed, and when the study of music will have taken the character of absolute liberty." This programme was accepted by most futurists, irrespective of nationality.

After the War the new movement continued throughout Europe with unabated vigor. A host of writers now appeared who effectively aided the composers, and in almost every country were established periodicals devoted exclusively to the cause of futurism. Through these persistent and systematic efforts a new public was recruited, sufficiently numerous to insure the success of a futuristic festival held in Salzburg in August, 1922. The immediate result of this festival was the formation of the International Society for Contemporary Music (I. S. C. M.), with headquarters in London, for the purpose of spreading the new cult by means of annual festivals. At the first official festival, which took place according to schedule at Salzburg in August, 1923, 35 composers of 14 different nationalities were represented on the programme.

On the older composers whose reputation had

been firmly established early in the century, the War seems to have had a blighting effect. Strauss, Puccini, Elgar, and Sibelius were not silent, but they produced in the decade 1914-24 not a single work even remotely approaching the best of their earlier efforts. In fact, the beginning of their decadence antedated the outbreak of the War by several years. Different is the case of Rachmaninov, by all odds the greatest of living Russian composers, who suddenly, without having given any indication of declining power, deserted the career of the creative artist for that of the virtuoso. If these men of pronounced individuality, whose earlier works have permanently enriched the literature of music, were unable to stem the rising tide of futurism, it is vain to hope for any counteracting influence from men of lesser ability, who almost without exception exhibit some phase or other of futurism.

In the musical development of the United States during the decade futurism played a secondary rôle. Futuristic tendencies, it must be admitted, were quite noticeable among the younger American composers; but as yet, with the exception of Leo Ornstein, these manifestations avoided the furthest extremes and could still be regarded as advanced Impressionism. The chief reason why the influence of these composers on the public taste was negligible is the conservative attitude of the general public and of our great musical institutions, whose programmes, in the main, were still drawn from the works of recognized masters. While impressionists had frequent hearings, futurists were represented but sparingly, and only very rarely by extreme works. Of the musical centres, New York, the most important, is also the most conservative. Bach, Beethoven, Schubert, Brahms, Wagner, and Tchaikovsky still held undisputed sway, and despite determined efforts on the part of certain conductors, the New York public had not yet become convinced of the merits of Bruckner, Mahler, or Reger. This state of affairs led a small group of futurists to establish, in 1921, the International Composers' Guild for the purpose of producing exclusively works of extreme tendencies, because "the standard symphony orchestras present only the most timid and anæmic of contemporary productions, leaving absolutely unheard the composers who represent the true spirit of our time." In spite of very active and noisy propaganda this group made few converts, and the works produced at their special concerts did not find their way to the programmes of our recognized institutions. Although since the beginning of the century there had arisen in all parts of the United States numerous composers whose efforts had been duly recognized and encouraged by the leading orchestras and choral societies, they had not succeeded in reaching their common goal, the creation of a national school of music that should be recognized as typically American. Numerous and earnest attempts to force such a consummation by means of prizes, competitions, and special organizations producing exclusively works of native composers had not yielded the expected results. Nevertheless, the efforts put forth by this generation of composers were by no means futile; they were preparing the soil from which, at some future day, will spring the longed-for national art. Until the outbreak of the War, Berlin had been the centre of the world's musical

activity. American artists seldom risked appearances in their own country unless they had met with approval in a Berlin debut. In this respect a complete change took place within the decade, so that a New York debut had come to be a passport not only for American artists, but also for many a European aspirant. As a natural consequence of the War a vast number of the world's most famous interpretative artists sought and found success in extended tours of the United States. The presence of so many celebrities at the same time compelled managers to extend the field of operation, so that even smaller towns were visited, with the result that interest was stimulated throughout the country. Tangible proof of this new interest is found in the large number of newly established musical organizations of all kinds in towns which had formerly never considered such institutions a necessity.

**Chamber Music.** The widespread interest in chamber music throughout the United States during the decade furnishes conclusive evidence of the steadily growing appreciation of the best music. In all parts of the country numerous new organizations not only had been formed but also successfully maintained themselves. The most notable event was the establishment of the annual Berkshire Festival, which was inaugurated Sept. 16-18, 1918. During the summer of 1917 Mrs. F. S. Coolidge began the erection on South Mountain, near Pittsfield, Mass., of the Temple of Music, a small concert-hall with a seating capacity of 500, to be devoted exclusively to the performance of chamber music. At the same time she offered a prize of \$1000 for the best string quartet to be performed at the inaugural festival. Not less than 82 manuscripts, many from European composers, were submitted. After the success of the first festival the \$1000 prize was made a regular feature. The programmes of the festivals are given by famous chamber music organizations from all parts of the Union. On two occasions European quartets participated, the London String Quartet (1920) and the Stuttgarter Streichquartett (1922). The programmes offered were remarkable for variety and catholicity of taste, favoring no nation and no period, and ranging from Bach to the moderns of the day. At the conclusion of the festival of 1922 announcement was made that the cash prize thereafter would be awarded biennially, in the even years. In the odd years new works were to be commissioned from prominent composers. The first composers to be honored with such commissions were Eugene Goossens (string sextet) and Rebecca Clarke (*Rhapsody* for 'cello and piano), both performed at the festival of 1923. The list of prize winners was as follows: 1918, Tadeus Iarecki, string quartet; 1919, Ernest Bloch, suite for viola and piano; 1920, Francesco Malipiero, string quartet; 1921, H. Waldo Warner, piano trio; 1922, Leo Weiner, string quartet; 1924, Wallingford Riegger, *La Belle Dame Sans Merci*, for vocal quartet and chamber orchestra. An event that should not pass unrecorded is the dissolution of the famous Kneisel Quartet, which played its last concerts at Boston (Mar. 13, 1917) and New York (April 3). Founded in 1886, with Franz Kneisel, Otto Roth, Louis Svecenski, and Fritz Giese as its original members, it played 32 consecutive seasons in Boston and 25 in New York, besides making numerous tours of the

United States and two of Europe. Its influence in practically creating and then cultivating taste for chamber music in America can scarcely be overestimated. For many years it had enjoyed the reputation of one of the finest quartets in the world.

**Community Music.** Community music, at least as the term had come to be understood, was a direct result of the War. Previously there had existed, especially in Philadelphia and Chicago, isolated associations of factory workers organized into choral societies, some of which had attained sufficient proficiency to appear in public concerts. During the War the soldiers, under regular leaders, were trained in choral singing, and this practice developed a genuine liking for music. Many ex-soldiers, after return to civil life, communicated the enthusiasm aroused in them by the camp songs to their fellow workers, with the result that in an incredibly short time employees of the larger companies in many industrial centres banded together for the cultivation of singing. Community choruses sprang up even in the smaller towns and villages throughout the country. The interest in music was not confined to singing; it immediately embraced the field of instrumental music, and numerous amateur orchestras and bands were established. By the end of 1920 the Bethlehem steel workers had recruited from among their own numbers not only a large chorus but also a complete symphony orchestra of almost 100 players. In the same year the employees of the Federal Reserve Bank in New York gave a complete stage performance of *The Bohemian Girl* without the assistance of an outsider even in the principal rôles or orchestra. In some of the larger cities, where musical appreciation naturally had been spread before the War, the new movement led to the establishment of community opera (Washington, Philadelphia, St. Louis, Cincinnati). In 1920 New York celebrated its first Music Week (February 1-7), when all musical organizations, churches, hotels, theatres, and many individuals combined to bring music in some form or other home to everybody. At the Grand Central Palace an exhibition of musical instruments was held throughout the entire week, with lectures and recitals. The interest aroused was so general that Music Week was made a regular annual institution, and a permanent committee of eminent musicians was appointed. The example was followed immediately by almost all neighboring communities, who had their Music Week before the end of the year. Within three years the idea had been adopted by the entire country. This widespread interest in music induced several municipalities to appropriate public funds for furthering various musical projects. Baltimore established a special department of Municipal Music, St. Louis a municipally subventioned summer opera, Chicago and Philadelphia municipal symphony orchestras, etc. In New York a movement was on foot in 1924 for the erection of a municipal conservatory, and the Musical Alliance of the United States had launched a movement for the establishment of a ministry of fine arts and a national conservatory in Washington.

**Festivals.** After the sudden interruption of the performances in the summer of 1914, the theatre dedicated to Wagner in Bayreuth remained closed for 10 years. During 1923 Sieg-

fried Wagner gave concerts in many German cities, raising funds for the restoration of the theatre and the resumption of the performances. For the same purpose he made a concert tour of the United States early in 1924. In the summer of 1924 the festival was resumed (July 22-August 20) with performances of the *Ring* dramas, *Meistersinger*, and *Parsifal*. After 1914 the chorus of the Bethlehem (Pa.) Bach Festivals was gradually augmented, until in 1924 it numbered 250. Up to 1920 the programmes had been selected exclusively from the choral works of Bach, but in that year instrumental works were included. The innovation was received with favor and was adopted as a fixed policy. In 1917 the chorus participated in a Bach-Beethoven festival in New York arranged by the Philharmonic Society, and in the following year in a Bach-Wagner festival of the Symphony Society.

Albert A. Stanley, conductor of the Ann Arbor festivals since their inception (1893), resigned in 1921 and was succeeded by Earle V. Moore. An annual festival lasting four days was founded in Newark in 1915 by Mortimer C. Wiske and conducted by him thereafter. At the North Shore Festival in Evanston, Ill., a prize of \$1000 was established in 1921. It was to be awarded annually for the best orchestral score submitted by an American composer, the successful work to have its first performance at the festival and then to be included in one of the regular concerts of the Chicago Symphony Orchestra during the following winter. The winners were Camille Zeckwer with *Jade Butterflies* (1922), Felix Borowski with *Youth* (1923), and Charles M. Loeffler with *Memories of Childhood* (1924). For the first time in its history, the annual festival at Worcester, Mass., was omitted in 1918, on account of an epidemic of influenza that swept the eastern States in the fall of that year. There was no festival in 1922, because the time was permanently changed from September to April. Arthur Mees resigned as conductor in 1919, and was succeeded by Nelson P. Coffin, who died shortly before the festival of 1923. The latter was under the direction of Arthur J. Bassett and J. Vernon Butler. In 1924 Henry Hadley was elected regular conductor.

**Mechanical Reproduction of Music.** There is not the least doubt of the fact that the introduction and rapid perfection of the player-piano and phonograph contributed in a large measure to the development of the public taste for better music. The former had been brought practically to perfection even before the War. This is true of the Welte-Mignon Duo-Art and Ampico reproducing pianos, which differ from player-pianos in that they faithfully reproduce that subtle quality termed the individuality of the artist. On Dec. 10, 1918, the Chicago Symphony Orchestra performed Saint-Saëns's concerto in G minor for piano and orchestra with Harold Bauer as soloist. The latter, however, was not actually present, but was represented by his Duo-Art record. At a concert of the New York Philharmonic Society (Apr. 23, 1919), the soloist, Leo Ornstein, sat motionless on the stage listening to his own reproduction of the first movement of Mendelssohn's Concerto in G minor, after which he took his seat at the instrument and played the remaining movements in person. In records for the phonograph, the decade witnessed a tremendous

improvement. It may be said that up to 1914 satisfactory records had been made only of solo voices or solo instruments. The accompaniment, whether for piano or orchestra, left much to be desired in regard to clearness and proper balance with the solo part. Reproductions of choruses sounded blurred, while orchestral records failed to reproduce the timbre of the different instruments. Especially wonderful was the progress made since then in the reproduction of orchestral masses, so that in the best records a practiced ear can detect such subtle differences in timbre as between an oboe and an English horn. Almost all the great symphony orchestras had played for the recording companies. One great problem, however, still remained for the manufacturers to solve. So far no one had succeeded in reproducing the real, resonant tone of the piano; even the best records sounded as if the artists were playing on a harpsichord or a harp.

Almost from the day of its inception broadcasting by radio became an important factor in the dissemination of good music. The first concert heard over the radio was broadcast by Station KDKA in Pittsburgh, on Nov. 3, 1920, and soon stations all over the country were broadcasting music. The beginning was made with dance music and popular songs of the day, but before long, in response to numerous requests, symphony concerts and entire operatic performances were broadcast. The demand for the better music rapidly assumed such proportions that managers, especially those of famous artists, fearing a decrease of attendance at concerts, inserted a clause in all contracts restraining their artists from giving their services gratis. Composers and publishers also began to demand payment of the usual fees on all works controlled by them. These demands the radio companies declared themselves unable to meet, as they derived no income whatever from the host of listeners. The result was that during the last months of 1923 there was a decided dearth of good music transmitted by radio. However, frequent conferences of representatives of the American Telephone and Telegraph Company (Station WEA, New York) and of managers and musicians finally resulted in the appointment of a committee who issued a general appeal for voluntary contributions from interested listeners. The public responded quickly and generously. With a considerable fund at hand a plan was worked out for the broadcasting of concerts of famous stars, beginning with the opening of the concert season in the fall of 1924.

**Opera.** The history of opera during the decade is a record of almost feverish activity barren of any artistic results. Of the enormous number of new works produced in all the opera houses of the world, especially after the Armistice, not one achieved an emphatic and general success promising an addition to what may be termed the standard operatic repertoire. The vast majority of these novelties did not even outlive the year of their original production. Of the two foremost living dramatic composers, Puccini brought out *La Rondine* (1917) and the triptych *Il Tabarro*, *Suor Angelica*, *Gianni Schicchi* (1918); Strauss, a revised version of *Ariadne auf Naxos* (1916) and *Die Frau ohne Schatten* (1919), winning in each case only a *succès d'estime*. To the already formidable list of his failures Mascagni added *Lodoletta* (1917)

and *Il Piccolo Marat* (1921). The more prominent among the composers whose works survived for several seasons and were heard in more than one city were d'Albert, with *Die Toten Augen* (1916; in the United States, 1923), *Die Revolutionshochzeit* (1919), *Sirocco* (1921), and *Marieken von Nymwegen* (1923); Pfitzner, *Palestrina* (1917); Schillings, *Mona Lisa* (1915; in the United States, 1923), Zandonai, *La Via della Finestra* (1919) and *Giulietta e Romeo* (1922). On May 1, 1924, the much heralded and long delayed première of Boito's *Nerone* actually took place at La Scala, in Milan. What had excited international interest in this event was the fact that for the last 25 years there had been constant reports of all kinds regarding this work, of which no one, not even the composer's intimate friends, had seen or heard a note. Expectation had been raised so high that nothing less than a masterpiece of Wagnerian power could have survived the ordeal. The consensus of critical opinion was that the première was a "magnificent failure." In spite of the fact that in the United States opera received a large share of public attention, New York and Chicago were still the only cities supporting a permanent operatic institution. Other cities were dependent on short visits from traveling companies, some of which, especially the San Carlo Opera Company and the Society of American Singers, were notable for the excellence of their ensemble. The taste of the general public showed a decided preference for the standard works, so that the production of novelties was left almost exclusively to the two permanent organizations. Neither of these institutions was fortunate with new works; not one of their novelties maintained itself in the repertoire. The fiasco of the only futuristic opera attempted so far, Prokofiev's *Love for Three Oranges*, by the Chicago company (1921), was such as to deter American managers from further experiments in this line, at least in the immediate future.

*Chicago Opera Association.* After the death of the general manager, Cleofonte Campanini (1919), his duties were divided between H. M. Johnson and Gino Marinuzzi, as executive and artistic director respectively. Complications arising from this dual directorship led, early in 1921, to the appointment of Mary Garden as sole director. Under her management the friction became even more acute, and a deficit of \$800,000 at the end of the season brought about the dissolution of the company (1922), after 12 years of splendid artistic achievement. Immediately the Chicago Civic Opera Company, with Samuel Insull as president, was organized and acquired all the properties and practically the entire personnel of its predecessor. While there was no change in regard to artistic policies, a radical departure in administration was inaugurated by vesting the executive power in the finance committee rather than in a single individual. Giorgio Polacco was made artistic director.

During the War the works of Wagner had been excluded from the repertoire. In 1920 *Lohengrin* was restored, in an English version, and was followed by *Die Walküre* (1921). After that, these and other works were sung again in the original German. During 1918-22 the regular season included a four weeks' visit to New York. The year 1922 is memorable for a transcontinental tour (January-April), which

was as brilliant artistically as it proved disastrous financially. Three operas by foreign composers had their world première in Chicago: Lazzari's *Le Sauteriot* (1918), Février's *Gismonda* (1919), and Prokofiev's *Love for Three Oranges* (1921). Native composers were encouraged by the production of Buchhalter's *A Lover's Knot* (1916), Hadley's *Azora* (1917), Nevin's *The Daughter of the Forest* (1918), De Koven's *Rip Van Winkle* (1920), and Stearns's *The Snow Bird* (1923). Two ballets by American composers were given in 1919, Borowski's *Boudour* and Carpenter's *The Birthday of the Infanta*. The following foreign works were given for the first time in the United States: Gnecci's *Cassandra* (1914); Saint-Saëns's *Déjanire* (1915); Massenet's *Cléopâtre* (1916); Gunsbourg's *Le Veil Aigle* (1917); Catalini's *Loreley* and Montemezzi's *La Nave* (1919); Ravel's *L'Heure Espagnole*, Messager's *Madame Chrysanthème*, Erlanger's *Aphrodite*, Marinuzzi's *Jacquerie* and Leoncavallo's *Edipo Rè* (1920).

*Metropolitan Opera House* (New York). The decade at the Metropolitan Opera House, under Giulio Gatti-Casazza as general manager, was a period of unexampled prosperity. There was no annual deficit to be met. Year by year the number of subscribers increased. No promises were made that were not strictly fulfilled. During the period of the War the works of Wagner and Strauss were temporarily withdrawn, but, beginning in 1920, they were restored, one after the other, to the repertoire. The policy of producing every season a work by an American composer, inaugurated in 1910, was maintained until 1920, except for the years 1915 and 1916. Thus the following operas were brought out: De Koven, *The Canterbury Pilgrims* (1917); Cadman, *Shanewis* (1918); Breil, *The Legend*, and Hugo, *The Temple Dancer* (1919); Hadley, *Cleopatra's Night* (1920). A ballet by an American, Gilbert's *The Dance in Place Congo*, was performed in 1918. Four world premières of works by foreign composers are to be recorded: Giordano, *Madame Sans Gêne* (1915); Granados, *Goyescas* (1916); Puccini, *Il Tabarro*, *Suor Angelica*, and *Gianni Schicchi* (1918); Wolff, *L'Oiseau Bleu* (1919). Following are the foreign operas given their American premières: Montemezzi's *L'Amore dei tre Rè*, Charpentier's *Julien*, and Wolf-Ferrari's *L'Amore Medico* (1914); Leonini's *L'Oracolo* and Borodin's *Prince Igor* (1915); Bizet's *Les Pêcheurs des Perles*, Gluck's *Iphigénie auf Tauris*, and Zandonai's *Francesca da Rimini* (1916); Rabaud's *Marouf* (1917); Liszt's *The Legend of St. Elizabeth* and Mascagni's *Lodoletta* (1918); Leroux's *La Reine Fiammette* (1919); Leoncavallo's *Zaza* and Tchaikovsky's *Eugen Oniegin* (1920); Weiss's *The Polish Jew* and Korngold's *Die tote Stadt* (1921); Mozart's *Così Fan Tutte* (1922); Vitadini's *Anima Allegra* and Schillings's *Mona Lisa* (1923); Riccitelli's *Compagnacci* (1924). The following operas, produced by other organizations than the Chicago and Metropolitan companies, complete the list of American premières during the decade: 1914, Mozart's *Bastien et Bastienne* (New York); 1915, Parker's *Fairyland* (Los Angeles); 1916, Moniuszko's *Verbum Nobile* (Philadelphia) and Mozart's *The Impresario* (New York); 1917, Donizetti's *Campanella di Notte*, Pergolesi's *La Serva Padrona*, Gounod's *Le Médecin malgré Lui* (all in New

York); 1918, Hadley's *Bianca* (New York); 1919, Vives's *Maruxa* and *Los Bohemios* and Messenger's *Monsieur Beaucaire* (both in New York); 1922, Dargomyzhsky's *Russalka* and Rimsky-Korsakov's *Tsarskaya Nevista* (San Francisco); 1923, Moniuszko's *Halka*, d'Alberty's *Die Toten Augen*, and Kienzl's *Der Evangelmann* (all in Chicago).

**Oratorio.** The steady decline of public interest in oratoria, which began long before the close of the last century, went on unchecked after 1914, with the result that the few works written in this form were produced by serious musicians mostly little known to the public. Even the masterpieces of Händel, Haydn, and Mendelssohn were heard less and less frequently.

**Orchestras.** While in the United States the opera formerly engaged the principal interest of the general public, the decade 1914-24 wrought a change in favor of orchestral music. All the older organizations vastly increased the number of their concerts, so that the orchestral season extended from October to May. In 1914 the Boston Symphony Orchestra had no rival in this country. Even then it was no secret that the perfection of its ensemble was due to daily rehearsing. Unfortunately no other orchestra at that time had a patron like Colonel Higginson who would bear the enormous expense involved. The longer musical season provided the natural solution of the problem, so that in 1924 we could boast not one but several premier orchestras unsurpassed anywhere in the world. Daily rehearsals had produced the identical result in all cases. Visits of orchestras to other cities and exchange of conductors had engendered a spirit of rivalry which makes for supreme efficiency. The soloist, formerly an indispensable attraction at every symphony concert, had come to occupy a secondary position. In 1912 the Boston Symphony Orchestra, under Dr. Muck, made the first successful experiment in giving concerts without the aid of soloists. From that time the practice became so common, that in 1924 soloists were engaged for perhaps not more than half the season's concerts. This widespread and intelligent interest in the music itself, rather than in the executant, had created a new, collective method of subventioning orchestras. The cost of maintaining a first-class organization is so heavy that the income from admissions is in every case insufficient to meet expenses. The burden of the inevitable annual deficit, formerly borne by some wealthy patron especially interested (e.g., Higginson, Carnegie, Flagler), was being assumed by several guarantors, each contributing a relatively small amount. In the latter years more than one of our premier orchestras was threatened with dissolution because of inability to meet the high cost of maintenance. In every case a sufficient number of public-spirited citizens came forward to avert a serious loss to the community. And when one considers that from the conclusion of the War every year new symphony orchestras were established throughout the country, he cannot but be impressed with the development of public taste during the decade.

**Boston Symphony Orchestra.** The refusal of Dr. Muck, in the fall of 1917, to play the national anthem before the concert, was the beginning of a period of storm and stress. He resigned at the end of the season. At the same time Colonel Higginson severed his relations

with the orchestra, delegating his powers and responsibilities to a board of nine directors. More than 20 German players, who had failed to take out naturalization papers, were dismissed. In 1918-19 Henri Rabaud was the conductor; under him the orchestra rapidly deteriorated. When Pierre Monteux, in the fall of 1919, assumed control he found a demoralized body of men, many of whom rebelled and deserted before the end of the season, so that out of a total of 100 performers only 67 remained for the final concerts. In addition, a deficit of \$131,000 brought the organization to the verge of dissolution (April, 1920). An appeal by the directors secured not only this amount but also a guarantee fund, pledged by 200 contributors, for five years. With a thoroughly reorganized and practically new orchestra Monteux began the difficult task of regaining the lost prestige. When Sergei Kusevitsky became conductor, in 1924, he found that his predecessor's efforts had been crowned with success.

**Chicago Symphony Orchestra.** In 1914 a pension fund was established through the gift of \$100,000 by Mrs. E. S. Coolidge, who donated the same amount also the next year. In 1923 Clyde M. Carr bequeathed to the organization \$1,000,000 to be used at the discretion of the trustees. In the spring of 1923 a number of music lovers saved the orchestra from disbanding by assuming responsibility for a considerable increase in the salary of the men demanded by the musical union.

**Cincinnati Symphony Orchestra.** After the internment of the conductor, Dr. Kunwald (January, 1918), the remaining concerts of the season were given under guest conductors. In 1918-22 Eugène Ysaÿe was conductor. His successor was Fritz Reiner.

**Minneapolis Symphony Orchestra.** In 1922 Max Oberhoffer resigned and was succeeded by Henri Verbruggen. At the same time the orchestra widened its field of activity by adding a series of 16 concerts in St. Paul, a series of 25 popular Sunday concerts and 5 educational concerts for young people.

**National Symphony Orchestra.** This organization was founded in New York in 1919 as the New Symphony Orchestra, under Edgar Varèse, for the exclusive production of futuristic works. The complete failure of the first concert (April 11) so alarmed the guarantors that they dismissed Varèse and engaged Bodanzky, who played only standard works at the remaining concerts. His success led to the incorporation of the orchestra as the National Symphony Orchestra, beginning its career in October, 1919. In the summer of 1920 it was engaged for the series of open-air concerts at the Stadium of the College of the City of New York, under Walter Rothwell as guest conductor. As Bodanzky's duties at the Metropolitan Opera House did not allow him sufficient time, the directors engaged Mengelberg for the second half of the season (January-March, 1921). He made a sensational success and remained with the organization after its amalgamation with the Philharmonic Society.

**New York Philharmonic Society.** The amalgamation of the society with the National Symphony Orchestra in 1921 led to a complete reorganization. Many of the older men were retired on pension, the personnel was increased to 125 performers, and a new schedule for in-

tensive rehearsals was adopted. Mengelberg was engaged as coördinate conductor with Stransky, the former directing the last half of the season, the latter the first half. In 1923 Stransky resigned and was succeeded by Willem Van Hoogstraten. From 1916-20 William Humiston was associate conductor; after those years the position was filled by Henry Hadley. During the summer of 1922 the entire orchestra was engaged for the open-air concerts at the Stadium; the first half of the series was led by Hadley; the second, by Van Hoogstraten. In 1923 Van Hoogstraten was conductor of the entire series. With the proceeds of two festival concerts celebrating the eightieth anniversary of the foundation of the Society (April, 1922) a benefit fund was established for the members.

*New York Symphony Orchestra.* Under its regular conductor, Walter Damrosch, the orchestra made a most successful tour of France, Italy, Belgium, and England in May and June, 1920. In 1921 and 1922 Albert Coates directed several concerts as guest conductor. Bruno Walter appeared in the same capacity in 1923-24, and Vladimir Golschmann in 1924.

*Philadelphia Symphony Orchestra.* In 1916 Edward Bok donated to the orchestra \$250,000 and pledged himself to pay any deficit for the next five years. In 1918 a regular series of five concerts in New York was established, the number of which was increased to 10 in 1921. During the absence of Leopold Stokowski as guest conductor in Paris, in 1923, his place was taken by Georges Enesco.

*St. Louis Symphony Orchestra.* After the death of Max Zach, in 1921, the remaining concerts of the season were led by guest conductors. From the fall of 1921 Rudolf Ganz was regular conductor.

Following is a list of the more important new symphony orchestras established during the decade. 1914: Detroit S. O., Weston Gales 1914-18, then Ossip Gabrilóvitch; 1916: Baltimore S. O., Gustav Strube; 1918: Cleveland S. O., Nikolai Sokolov; 1919: Los Angeles Philh. O., Walter Rothwell; 1920: Nashville S. O., F. A. Henkel; Toledo S. O., Lewis Clement; 1921: Erie S. O., Henry Vincent; Buffalo S. O., Arnold Cornelissen; 1922: Syracuse S. O., William Berwald; Watertown S. O., Patrick Conway; Salt Lake City Philh. O., Charles Shepard; Wichita S. O., P. H. Flath; 1923: State S. O. (New York), Josef Stransky; Rochester Philh. O., Eugene Goossens and Albert Coates as guest conductors; Civic S. O. of Philadelphia, Vassili Leps; Atlantic City Philh. Soc., Louis Colmans; American National O. (New York), Howard Barlow.

**MUSSOLINI, BENITO** (1884- ). An Italian statesman, founder of the Fascisti. He was born at Predappio-Forli and educated at the Salesian College in Faenza and the University of Lausanne (Switzerland). When he began his career he was a Marxian socialist and was expelled from Switzerland and also from Austria on account of his views. He returned to his birthplace and there started *Lotta di Classe* and later became the editor of the *Avanti*. He was also a director of the Italian Communist party. At the outbreak of the War in 1914, he took the side of the Allies and urged that Italy enter the conflict against Germany. He was expelled from the Socialist party and at once started a new paper, the famous *Popolo d'Italia*. Fighting in the War as a corporal in the infantry, he was wounded, decorated, and discharged. Later he returned to his editorial desk. In 1919, when the wave of communism swept over Italy and the government at Rome seemed unable to combat the disorder prevalent in the country, Mussolini raged against the traitors who were ruining Italy; on Mar. 23, 1919, he founded the first "Fascio di Combattimento," which was later to be known collectively as the Fascisti, from the Roman *fasces*. Officers and soldiers rallied to his support, and by 1922 there were about 4,000,000 Fascisti in Italy. Civil war raged during 1922 between the Fascisti and the Communists. Mussolini's legions reopened factories, stopped strikes, and broke up trade unions. By August the power of communism was broken. In October, 1922, Mussolini declared he would take the government by force if it were not given to him willingly. On Oct. 30, 1922, the King made him prime minister. He made drastic reforms during 1923, and in the April elections of 1924 the Fascisti received 65 per cent of the votes cast. See FASCISM and ITALY.

**MUTATION THEORY.** See ZOÖLOGY.

**MUZZEY, DAVID SAVILLE** (1870- ). An American historian and author, born at Lexington, Mass., and educated at Harvard University, Union Theological Seminary, New York and Columbia Universities, and in Berlin and Paris. After serving as tutor in mathematics at Robert College in Constantinople for one year, he became a teacher of Latin and Greek in the Ethical Culture School of New York. In 1905 he was appointed head of the department of history at Barnard College and was successively associate, associate professor, and professor; the last office he assumed in 1920. He was a member of several learned societies and wrote *Rise of the New Testament* (1900); *Spiritual Heroes* (1902); *Beginners' Latin Book* (1907); *American History* (1911); *State, Church, and School in France* (1911); *Life of Thomas Jefferson* (1918); and *The United States of America* (1922).

**MYCENÆ.** See ARCHÆOLOGY.

**NANSEN, FRIDTJOF** (1861- ). A Norwegian Arctic explorer (see Vol. XVI). He was active during the War and was chairman of the Norwegian Association for the Nations in 1918. In the following year he proposed to the Allies the formation of a central commission for the supply of food to Russia. This was rejected by the Bolshevik government, which would not agree to the Allies' conditions that hostilities should first cease. He was asked by the Council of the League of Nations in 1920 to investigate problems in connection with the repatriation of prisoners of war; on this subject he prepared an exhaustive report. From 1920 to 1923 he had general charge of the direction of relief for Russian refugees. He published *Through Siberia* in 1914.

**NAPHTHA.** See PETROLEUM.

**NASHVILLE.** The capital of Tennessee. The population rose from 110,364 in 1910 to 118,342 in 1920, and to 121,128, by estimate of the Bureau of the Census for 1923. The city changed its form of government to the commission-manager plan in 1918. A nine-hole municipal golf course was constructed in 1923. In 1924 the city, in coöperation with Davidson County and the State of Tennessee, was engaged in building, at a cost of \$2,225,000, a memorial to the soldiers in the late War, which occupied two blocks in the centre of the city and was to contain an auditorium seating 2500 persons. A temporary replica of the Parthenon which had been built some years previously, was reconstructed in more permanent form during the decade.

**NATAL PROVINCE.** See SOUTH AFRICA, UNION OF.

**NATHAN, GEORGE JEAN** (1882- ). An American author and dramatic critic, born in Fort Wayne, Ind., and educated at Cornell University and the University of Bologna, Italy. From 1905 he has been connected with various newspapers. He was dramatic critic, with Huneker, of *Puck* (1915-16), and of the *Smart Set Magazine* (1908-23). During 1914-23 he was editor of *Smart Set* with H. L. Mencken, and in 1924 he started with Mencken a new magazine, *The American Mercury*. His knowledge of the French, German, and English stage, and his keen observation, perspicacity, and discriminating sense of humor, have made him one of the leaders in criticism in the United States. Some of his books are *The Eternal Mystery* (1913); *Another Book on the Theatre* (1916); *Bottoms Up* (1917); *Mr. George Jean Nathan*

*Presents* (1917); *A Book Without a Title* (1918); *The Popular Theatre* (1918); *Comedians All* (1919); *Heliogabulus*, with H. L. Mencken (1920); *The American Credo*, with H. L. Mencken (1920); *The Theatre, the Drama, the Girls* (1921); *The Critic and the Drama* (1922).

**NATHAN, ROBERT** (1894- ). An American author, born in New York City. He was educated in private schools in the United States and Switzerland and took graduate courses at Harvard. His published writings include *Peter Kindred* (1919); *Autumn* (1920); *Youth Grows Old* (1922); and *The Puppet Master* (1923). He also composed songs and a sonata for the violin.

**NATIONAL SAFETY COUNCIL.** A co-operative, noncommercial organization established in 1913 as an outgrowth of the safety congress held under the auspices of the Association of Iron and Steel Engineers in Milwaukee. The council consists of an association of companies and individuals active in promoting safety in industrial establishments, on the streets, and in the homes. Annual meetings are held in which matters relating to this object are discussed. The meeting of 1915 was held in Philadelphia. There were present representatives from the mines, railroads, public utilities, and industrial establishments. Each of these groups held sectional meetings to discuss their technical problems. The Eighth Annual Safety Congress was held in Cleveland in October, 1919. There were meetings of the 19 sections of the Council representing the various industries of the United States. The programme for 1919 included the extension of the work into many new fields. In 1920 the *National Safety News*, organ of the Council, was enlarged from a one-

sheet bulletin to a 12-page magazine and began an active campaign for spreading safety propaganda throughout the country. The annual meeting of 1920 was held in Milwaukee. In 1920 the council continued active in safety propaganda, with great success. Extensive research was continued into the particular hazards and safety practices in the construction and management of particular equipment. The congress of the Council in 1922 was held in Detroit, Mich. Over 2000 members met to discuss their problems and to hear speakers of national reputation. Work with schools was vigorously carried on. Through a publication entitled *Education in Accident Prevention: Methods and Results*, the city superintendents in all cities of 20,000 or more population were reached, and in many cases a definite safety plan was incorporated in the curriculum. Gratifying progress was reported in the activities of the organization in 1923. Two million copies of workmen's bulletins were distributed during the year, at the rate of 36 new and different ones per month. The magazine grew to 64 pages. The 12th annual congress was held in Buffalo in October. Over 3500 delegates were in attendance, representing every State in the Union and every major industry in North America. The Council in this year had 23 specialized sections relating to all phases of industry. Its membership was about 4000, operating 8000 industrial plants, and employing more than 7,000,000 men. Community safety councils had by this time been organized in 60 cities to carry on public and industrial safety work in each community. Combined population of these cities where organized safety programmes are under way totaled 25,000,000 in July, 1924. L. A. DeBlois was elected president in 1923, and C. B. Auel was chosen vice president in charge of general activities. The managing director and secretary was W. H. Cameron.

**NATIONAL SYMPHONY ORCHESTRA.**  
See MUSIC, *Orchestras*.

**NATURAL GAS.** Although fears were expressed as to the ultimate exhaustion of natural gas in the years 1914-24, consumption increased, and systems of pipe lines were developed from the leading production centres, of which West Virginia, Oklahoma, Pennsylvania, Ohio, and California were perhaps the most important. In 1913 the consumption of natural gas in the United States was 581,898,239,000 cubic feet, 38 per cent of which was consumed by domestic consumers and 62 per cent by industrial consumers. The average price per 1000 cubic feet received by distributors at this time was \$.051. In 1914 the natural gas consumed was 591,867,000,000 cubic feet, and from this time it steadily increased until in 1920 the maximum consumption of 798,210,000,000 cubic feet was scored. In the following year, 1921, there was a decline in the consumption, which then amounted to 662,052,000,000 cubic feet, and the market value of the gas used was about \$175,000,000, a decrease about \$25,000,000 in the value from 1920.

At this time there were more than 2,500,000 domestic consumers of natural gas and about 21,000 industrial concerns using it as fuel. In the following year, 1922, 762,546,000,000 cubic feet were consumed in the United States, at an estimated value of \$84,873,000 at the wells and of \$221,535,000 at the points of consumption. By 1919 the cost at the point of distribution

had increased to \$.216 per 1000 cubic feet, and in 1922 it was \$.291 per 1000 cubic feet. In 1922 the average charge for domestic consumption was \$.499, an increase of more than \$.15 in the previous four years. The 1922 consumption was some 15 per cent more than that of 1921 but 4 per cent less than the amount consumed in the record year of 1920. The five leading States in production were West Virginia, Oklahoma, Pennsylvania, Louisiana, and California. The amount of production did not measure the relative consumption of the various States, as Pennsylvania in 1922 led as a consumer, followed by Ohio, Oklahoma, California, and West Virginia. There was also an increased interstate movement of natural gas, which, by 1922, had amounted to 179,000,000,000 cubic feet. West Virginia, which contributed 25 per cent of the total production and consumed only 10 per cent, contributed 66 per cent of the gas transported to other States, where the average price per 1000 cubic feet in 1913 was \$.051 at the point of distribution.

In 1924 the industry had developed to a stage where the production and transportation of natural gas was no longer characterized by wastefulness and inefficiency. Various methods were adopted to conserve this fuel, as it was realized that while it was fast disappearing it was a commercially valuable natural resource.

In addition to domestic and industrial uses as fuel, an important branch of the industry was the manufacture of gasoline from natural gas. In 1911, when the United States Geological Survey collected its statistics for gasoline from natural gas for the first time, it was reported that the year's production of gasoline thus obtained amounted to 7,425,839 gallons valued at \$531,704, or \$.0716 per gallon. This gasoline represented the output of 176 plants conducted by 132 operators, with a total daily capacity of 37,100 gallons, and employing an estimated volume of natural gas of 2,475,697,000 cubic feet, which was valued at \$176,961. The average yield of gasoline per 1000 cubic feet was 3 gallons. This industry steadily increased, so that in 1914 the amount of gasoline produced was 42,652,632 gallons valued at \$3,105,909. By 1922 the production of natural gas and gasoline amounted to 505,832,000 gallons, valued at the plants at \$72,711,063, or an average of \$.144 per gallon. To produce this gasoline, 545,000,000,000 cubic feet of natural gas were treated, or approximately 71 per cent of the total quantity consumed for the year. Gasoline from natural gas was produced by what is known as the compression process, which in 1922 accounted for 285,670,163 gallons; by the absorption process, by which were manufactured 182,209,056 gallons; by a combination process, which produced 36,035,999 gallons; and by a drip process, which produced 1,916,782 gallons. See CHEMISTRY, ORGANIC.

**Bibliography.** Besides the publications of the United States Geological Survey and the United States Bureau of Mines, which are generally available, reference may be made to L. C. Lichty, *Measurement Compression and Transmission of Natural Gas* (New York, 1924), and the chapters on natural gas in *The Handbook of the Petroleum Industry*, 2 vols., edited by D. T. Day (New York, 1922). This volume discusses the manufacture of gasoline from natural gas.

**NAVIES OF THE WORLD.** The approval in 1923 of the Five Power Naval Pact for the limitation of armaments by the Governments of France and Italy put that treaty in force, as the Governments of the United States, Great Britain, and Japan had given their assent soon after the conclusion of the Conference. While its terms only then became binding on the signatories, no one of the five powers had in any way contravened any of them since the Pact was originally signed by the diplomats at the Disarmament Conference. Not only did new work cease, but scrapping of the older vessels designated for such a fate by the Pact had to a considerable extent been carried out. Scrapping of the new vessels was proceeding at a rapid rate in 1924. The general condition of the more important navies of the world on July 1, 1924, was briefly as follows.

**Argentina.** The navy consists of 2 dreadnaught battleships of 27,600 tons (12 12-inch guns) completed in 1914; four armored cruisers of 6800 to 7100 tons, completed 1895-97; three old protected cruisers of 2750 to 4800 tons, completed 1892-97; two old monitors of 2336 tons, completed 1892-93; 8 destroyers of 1100 to 1200 tons, completed 1911; several large gunboats, river gunboats, transports, old torpedo boats, etc. It was proposed to refit the battleships in the United States and to order about 12 large destroyers.

**Austria** possessed neither navy nor sea-coast but had four armed patrol vessels on the Danube.

**Australia.** Since the close of the War, the Australian navy was steadily reduced. Late plans called for the sale of 24 out of the 34 vessels on the navy list. Those to be retained were four light cruisers of about 5500 tons, completed 1912-20; one flotilla leader of 1660 tons, completed 1917; and five destroyers of 1250 tons, 36 knots, completed 1919. At last accounts in 1924 there still remained on the list six submarines of 1820 tons, completed 1917-19; several destroyers of 700 tons, and 3 1250-ton sloops, completed 1915. These were all effective vessels and in good condition. The battle cruiser *Australia* was scrapped in accordance with the terms of the Five Power Naval Pact. From statements which appeared in the British and Australian press it appeared that Australia desired to depend for defense chiefly on the British fleet but would pay her share of the cost of defense by the Royal Navy.

**Brazil.** The Brazilian Congress authorized the construction of a training-ship, a mine transport, and a surveying ship. The Minister of Marine proposed the construction of a battleship of 35,000 tons, a cruiser of 10,000 tons, 5 destroyers, 5 submarines, an aircraft service, and some mine-layers and sweepers. The navy in 1924 consisted of 2 battleships of 19,281 tons (12 12-inch guns), completed in 1910; 2 armored coast defense vessels, 1900-01; 2 light cruisers of 3100 tons and 27 knots, 1910; 2 old cruisers; 4 river gunboats; 1 mine-layer; 2 river monitors; 10 destroyers of 550 tons, completed in 1908-10; 1 destroyer of 950 tons, 1913; 1 torpedo boat, 1907; and 3 submarines, 1914.

**Canada.** Having from motives of economy reduced her naval, military, and air establishments to almost nothing, Canada consolidated them under the new Ministry of Defense. The naval force in 1924 consisted of 2 destroyers and 4 mine-sweepers, half based at Halifax and half at Equimaunt, where they were used to train the Canadian naval reserve which was to act as a nucleus in case future naval expansion should be found necessary.

**Chile.** The navy consists of one modern battleship of 23,000 tons, 10 14-inch guns, 23 knots speed, completed in 1915; 1 old battleship of 6000 tons; 2 old armored cruisers of 7000 and 8500 tons; 5 old protected cruisers of 2000 to 4500 tons; 4 flotilla leaders of 1700 to 1850 tons, completed in 1912-14; 7 small destroyers; 3 torpedo boats; 2 submarines, 1913. It was said in 1924 that notwithstanding their age, the vessels of the Chilean navy were in serviceable condition and that the efficiency of the personnel was excellent.

**China.** The Chinese navy as a unified force no longer existed. There were many small cruisers, gunboats, destroyers, torpedo boats, etc. Some vessels were controlled by the Canton government; some by the government at Peking; others were a law unto themselves or had unknown affiliations. The natural result was a breakdown of morale and discipline as well as a deterioration of the vessels from lack of care and of means for effecting repairs and preservation.

**Denmark.** In the naval budget for 1923-24, 10,342,000 crowns were allotted for new construction, including aircraft and aviation supplies. The new construction comprised 2 submarines and 1 lighthouse tender and ice breaker. The Danish navy consisted of 5 armored coast defense vessels of 2200 to 4100 tons; 4 small cruisers of 1300 to 3000 tons; about 15 mine-layers and sweepers; and various auxiliary vessels. The personnel had a high reputation for efficiency.

**France.** After a long delay, the French government signed the Five Power Naval Pact for the limitation of naval armaments. As France and Italy were the real gainers by the carrying out of the Pact, their attitudes toward it were rather remarkable. Were it not for the Pact, the United States, Great Britain, and Japan would soon have possessed navies of such strength that those of France and Italy would have descended to relative impotence. The United States alone scrapped tonnage of six times the fighting value of existing French dreadnaughts. Instead of possessing a navy in 1925 of 10 times the power of France, the United States restricts itself to 3 times. Great Britain

and Japan made great if considerably less reductions.

The building programme under construction in France in 1924 consisted of 3 light cruisers of 8000 tons, 6 flotilla leaders of 2400 tons, 12 torpedo boats of 1450 tons, 6 submarines of 1100 tons and 6 of 680 tons; the battleship *Bearn*, only partly built, was to be transformed into an airplane carrier of about 23,000 tons. These vessels were to be completed in 1925. The second part of the naval programme, which up to the summer of 1924 had not been wholly authorized by the French Parliament, was designed to be laid down during the years 1925-28 and completed in 1930. It consisted of 6 light cruisers of 10,000 tons, 15 flotilla leaders of 2400 tons, 24 destroyers of 1450 tons, 4 submarine cruisers of 3000 tons, 30 first-class submarines of 1300 tons. The cruisers of 8000 tons were to have a speed of 34 knots and to carry 8 6.1-inch guns in 4 turrets, 4 2.95-inch anti-aircraft guns, and 4 21.7-inch torpedo tubes. Two 10,000-ton cruisers were to be laid down in 1925. The reported details were: speed, about 35 knots; battery, 8 8-inch guns and 20 anti-aircraft guns. As the weight necessary to armor the upper deck as a defense against air-bombs would reduce the possible speed, numerous anti-aircraft guns were substituted. It is expected that they will enable the ship to meet attacking airplanes with a hail of chemical projectiles. The 8-inch guns were to be mounted in gas-tight turrets to obviate danger from gas bombs and gas shells. The flotilla leaders were to be of about 2400 tons. The principal details were: length, 380.6 feet; beam, 36.3 feet; mean draft at a displacement of 2400 tons, 14.8 feet; speed, 35.5 knots; armament, 6 5.1-inch guns, 2 2.9-inch anti-aircraft guns, and 2 triple torpedo tubes for 21.7-inch torpedoes. The destroyers were to be of 1400 tons; speed, 33 knots; armament, 4 5.1-inch guns.

The French navy in 1924 consisted of 6 dreadnaught battleships of 23,100 tons, 2 carrying 10 13.4-inch guns and 4 carrying 12 12-inch guns; 3 old battleships of 18,890 tons carrying 4 12-inch and 12 9.4-inch guns; 10 old armored cruisers of 9400 to 14,100 tons but of little fighting value; 5 (ex-German) light cruisers (26 to 28.5 knots); 19 destroyers of 800 to 950 tons, 27 destroyers of 350 to 685 tons; and about 60 submarines.

Germany. The Allied Supreme Council increased the number of battleships and of cruisers which Germany was permitted to retain from 6 to 8, the additional 2 to be always in reserve without ammunition or supplies. The battleships might be replaced by new ones of not more than 10,000 tons and the cruisers by new ones of not more than 6000 tons, after 20 years from the date of completion. All will have reached that age before new ones can be built. The only vessel under construction in 1924 was a light cruiser of 5600 tons. The 8 battleships were of 13,000 tons and were to carry 4 11-inch and 14 6.7-inch or 5.9-inch guns. The 8 cruisers were small and all but 2 were over 20 years old. There were 16 destroyers and 16 torpedo boats.

Great Britain. The Naval Estimates for 1924-25 called for an expenditure of £55,800,000. The personnel of the navy, coast guard, aviation service, and marine police was fixed at 100,500, an increase of 1000 over the figures for

the previous year. The vessels under construction or to be laid down in 1924 were the battleships *Nelson* and *Rodney*, commenced early in 1923, 2 or 3 submarines, 7 to 9 light cruisers of about 10,000 tons, and the mine-layer *Adventure* of 7000 tons. The aircraft carriers *Eagle* (22,700 tons) and *Hermes* (10,400) had been under construction for many years but were not reported as completed by the middle of 1924.

The battleships *Nelson* and *Rodney* were the only vessels of their class under construction in any country in 1924. Their displacement was the maximum allowed by the Five Power Naval Pact, 35,000 standard tons. This was computed on a slightly different basis from that of existing capital ships, but they would probably be 3000 tons larger than any existing battleships except the British *Hood* and 6000 to 10,000 less than most of the capital ships scrapped under the terms of the Pact. As their design was an attempt to solve problems of naval construction which appeared to demand much greater size, it was being studied with interest by all naval authorities. The principal details available, July 1, 1924, were: length, 660 feet; beam, extreme, 106 feet; mean draft, 30 feet; speed, 23 knots; boilers, oilburning; engines, geared turbines; 3 turrets, each mounting 3 16-inch guns; all turrets on the central line, 2 on the forecastle, the after one firing over the other, the third just forward of the smokepipe; no stern fire from 16-inch guns, but the after turret could fire nearly astern with the outboard guns; 12 6-inch guns in 6 turrets, 3 on each beam; 12 4-inch anti-aircraft guns with vertical or nearly vertical fire; above-water triple torpedo tubes for 21-inch torpedoes; quarter-deck clear of all structures in order to permit the landing and despatch of airplanes; armor belt, 13 inches thick; 3 armor decks, upper deck, deck at top of belt, and curved deck extending to lower edge of belt; side heavily bulged and compartmented for antitorpedo protection; hydraulic steering and turret machinery.

The new submarine *X1*, completed in 1923, had finished her trials in 1924 and was said to have failed to realize the hopes of her designers. She was much the largest submarine ever built, having a submerged displacement of 3500 tons and a surface displacement of 2750 tons with corresponding speeds of 18 and 33 knots. The Admiralty and seagoing officers of all ranks in 1924 were fighting hard to obtain entire control of the naval aviation service. To have the most suitable designs for naval aircraft, which differ widely from those in land service, to have naval aviators who possess intimate knowledge of the details of naval affairs, and to have a continuous naval organization and control of the air forces of each fleet or other naval unit are so vital to efficiency that the slight financial gain in a consolidated air service should not be considered.

The vessels of the British navy in 1924 were: 5 battleships of 25,750 tons (8 15-inch guns, 23 knots), 5 battleships of 27,500 tons (8 15-inch guns, 25 knots), 4 battleships of 25,000 tons (10 13.5-inch guns, 21 knots), 4 battleships of 23,000 tons (10 13.5-inch guns, 22 knots), 1 battleship of 41,200 tons (8 15-inch guns, 31 knots); 1 battle cruiser of 28,500 tons (8 13.5-inch guns, 30 knots), 2 battle cruisers of 26,500 tons (6 15-inch guns, 32 knots); 35 light cruisers with a speed of 29 knots (14 of 3750 tons,

3 of 4120 tons, 10 of 4190 tons, 8 of 4750 tons), 6 light cruisers of 25.5 knots (3 of 5250 tons, 3 of 5400 tons), 3 light cruisers of 9750 tons and 30 knots, and 3 of 7550 tons and 32 knots; 17 flotilla leaders of 1610 to 1800 tons; 170 destroyers of 1040 to 1350 tons and 34 to 36 knots; 27 steam sloops of 1250 tons and 17 knots; 56 twin-screw mine-sweepers of 800 tons and 16 knots; 16 patrol boats of 573 tons and 22 knots; and 92 submarines of 500 to 3500 tons (submerged), most of them of 800 to 1100 tons.

**Greece.** The defeat of Greece by the Turks and the various political upheavals and financial disturbances interfered with the development of the navy. The fleet in 1924 consisted of 2 predreadnaught battleships (formerly the *Mississippi* and the *Idaho*) of 13,000 tons, 1 armored cruiser of 9956 tons and 24 knots; 1 light cruiser of 2600 tons and 23 knots; 11 destroyers of 350 to 980 tons; and 2 submarines of 460 tons. The dreadnaught battleship *Salamis* was ordered in Germany in 1913. At the close of the War she was still far from finished but probably would be completed in a French shipyard. As designed, the displacement was 19,500 tons; length, 570 feet; beam, 82 feet; draft, 26 feet; speed, 25 knots; battery, 8 14-inch guns, 12 6-inch guns, and some of 3-inch calibre. In addition to completing the *Salamis*, Greece ordered 4 large destroyers in England.

**Italy.** The naval budget for 1923-24 was 770,465,015 lire (1 lira=about \$.043). No new construction of any importance was in hand. A building programme was announced in 1923, the work to begin as follows: 1924-25: 2 light cruisers, 4 destroyers, 4 submarines; 1925-26: 4 destroyers, 4 submarines; 1926-27: 4 destroyers, 4 submarines; 1927-28: 1 light cruiser, 4 destroyers, 4 submarines. The Italian navy in 1924 consisted of 5 battleships of about 22,500 tons (13 12-inch guns, 23 knots), 1 battleship of 19,500 tons (12 12-inch guns, 24 knots), 4 predreadnaught battleships of 12,600 tons; 3 armored cruisers of 9956 tons and 22.5 knots; 8 light cruisers of 3200 to 4800 tons and 27 to 28 knots, 1 light cruiser of 3700 tons and 22 knots; 8 flotilla leaders or scouts of about 35 knots speed, 2 of them of 1500 tons, 2 of 1800 tons, 3 of 2158 tons, and 1 of 2500 tons; 14 destroyers of 320 to 380 tons, 42 destroyers of 650 to 850 tons, 12 destroyers of 922 to 1012 tons, 1 destroyer of 1354 tons; about 90 torpedo boats of 110 to 210 tons; 33 submarines of 300 to 460 tons, and 10 of 920 to 1000 tons. One of the battleships of 22,500 tons, the *Leonardo da Vinci*, was blown up and sunk during the War; it was later raised, but whether it would be repaired or not was uncertain.

**Japan.** The naval budget for 1924 was 238,500,000 yen (1 yen=about \$.41). Notwithstanding the damages inflicted by the earthquake, the vessels of the 1923-24 programme were to be laid down as soon as the various shipyards were free to undertake the work. This programme included: 4 light cruisers of 10,000 tons, 2 of 7100 tons; 18 destroyers of about 1500 tons; 16 submarines with submerged tonnages of 1500 to 2500 tons. All vessels of the programme were to be completed by 1928. On July 1, 1923, the following vessels were under construction: 1 light cruiser of 3100 tons, 5 of 5600 tons, 2 of 7100 tons; 7 destroyers of 1400 tons and 4 of 900 tons; 2 airplane carriers (ex-battle cruiser *Akagi* and ex-battleship

*Kaga*); 4 gunboats of 338 tons; 5 auxiliary service vessels. The number of light cruisers completed, building, or authorized since 1918 was 25; all had speeds of 33 knots or more. The navy yard at Yokosuka was damaged by the earthquake to the extent of 35,000,000 yen, and other yards, public and private, were seriously injured. One of the greatest losses was that of the great oil storage tanks which held about 3,000,000 barrels. All the earthquake damages were being rapidly repaired, and the Yokosuka yard was to be ready to undertake shipbuilding work soon after June, 1924.

The Japanese fleet, including light cruisers and smaller vessels under construction, in 1924 consisted of 2 battleships of 33,800 tons (8 16-inch guns, 23.5 knots); 2 battleships of 31,260 tons (12 14-inch guns, 23 knots), 2 battleships of 30,600 tons (12 14-inch guns, 23 knots); 4 battle cruisers of 27,500 tons (8 14-inch guns, 27.5 knots); 3 armored cruisers of 9800 tons; 4 light cruisers of 10,000 tons (35 knots), 4 of 7100 tons (35 knots), 14 of 5600 tons (35 knots), 3 of 4950 tons (26 knots), 1 of 4100 tons (23 knots), 2 of 3500 tons (31 knots), 1 of 3100 tons (34 knots); 18 destroyers of 1500 tons, 7 of 1400, 22 of 1350, 6 of 1200, 25 of 900, 1 of 955, 18 of 835, 10 of 665, and 2 of 600. The details of Japanese submarines are rarely published. There were said in 1924 to be about 80 boats including those already mentioned as belonging to the new programme of construction.

**Netherlands.** Several building programmes, including one in 1923, were submitted to the Netherlands Parliament, but all were rejected. The vessels of the navy in 1924 consisted of 5 armored coast-defense ships of 5000 to 6500 tons (1903-1910); 2 new light cruisers of 7050 tons and 30 knots, 3 or 4 old cruisers of 4000 tons; 3 armored gunboats of 540 tons, many other gunboats at home and in the Dutch East Indies; 4 new mine-layers (1922) of 750 tons, 12 other mine-layers; 4 small mine-sweepers; 1 new submarine depot ship of 2500 tons; 8 destroyers of 480 tons; 8 torpedo boats of 322 tons, 7 torpedo boats of 130 to 190 tons; 11 submarines of about 700 tons, 3 of 380 tons, 5 of 150 to 234 tons, and 1 submarine mine-layer.

**Norway.** The naval budget for 1922-23 was 21,340,160 crowns (par value \$.0268). Two submarines of 420 tons in 1924 were building in Norway. The vessels of the navy were 4 armored coast-defense ships of 3920 to 4233 tons; 1 small cruiser of 1350 tons; 9 gunboats of 190 to 620 tons; 3 destroyers of 540 tons; about 30 torpedo boats of 65 to 220 tons; 4 submarines of 255 tons, 2 submarines of 420 tons; and 3 new mining vessels of 335 to 755 tons.

**Russia.** The Russian navy by 1924 apparently was becoming less and less efficient, partly from lack of regular organization, partly from lack of intelligent control and care of vessels and equipment, and partly from lack of sufficient funds to keep the vessels and equipment in repair. One dreadnaught battleship was usually kept in commission and one in reserve; the other battleships and cruisers were unfit for service. A number of destroyers and submarines were kept in commission, but whether effective or not was unknown. Other vessels in service were mine-sweepers, mine-layers and ice breakers. Two divisions of destroyers were in commission in the Black Sea, but no large ves-

sels. Much attention was being paid to aviation, and efforts were being made to extend the service.

**Spain.** The naval budget for 1923-24 was 125,899,543 pesetas (par value=\$0.193). It provided for an enlisted force of 13,000 in the seaman branch and 2556 marines. The vessels building in 1924 were: 2 light cruisers of 4725 tons and 29 knots, and 2 of 7975 tons and 33 knots; 3 submarines of 610 tons; 3 flotilla leaders of 1650 tons and 36 knots; 3 destroyers of 1145 tons and 34 knots; 3 gunboats of 1335 tons and 18 knots. In addition to the foregoing, the vessels of the navy in 1924 were: 2 dreadnought battleships of 15,500 tons (8 12-inch guns, 19.5 knots), 1 old (1888) battleship of 9733 tons; 3 old (1898) armored cruisers of 7400 to 9900 tons; 1 old light cruiser of 5800 tons and 19.5 knots, 1 light cruiser of 5590 tons and 25 knots, 1 old light cruiser of 2100 tons and 19 knots; 5 gunboats of about 800 tons; 1 mine-layer of 1773 tons; 1 submarine salvage vessel of 2100 tons; 7 destroyers of 300 to 460 tons; 22 torpedo boats; and 10 submarines, 3 of them of 383 tons, 6 of 740 tons, and 1 of 685 tons.

**Sweden.** The navy of Sweden in 1924 consisted of 3 new armored coast-defense vessels of 7605 tons and 22 knots, 6 older ones (1901-07) of 3620 to 4700 tons and 16 to 18 knots, 7 others (1891-99) of 3400 to 3715 tons; 1 armored cruiser of 5000 tons and 22.5 knots; 1 mine cruiser of 1800 tons and 20 knots; 4 torpedo gunboats of 830 tons and 20 knots; 4 other small gunboats; 10 destroyers of 480 to 500 tons and 30 knots; 17 torpedo boats of 106 to 120 tons and 25 knots, 10 torpedo boats of 60 tons; 11 submarines of 370 tons, and 5 smaller submarines.

**Turkey.** The Treaty of Sèvres deprived Turkey of her naval force and nearly all her seacoast. The Treaty of Lausanne returned the most valuable parts of her seacoast as well as the remains of her fleet, consisting of the battle cruiser *Sultan Selim* (formerly the *Goeben*, 22,640 tons, 10 11-inch guns, 28 knots); the old battleship *Torgut Reis* (formerly the *Weissenburg*, 9900 tons, 6 11-inch guns, 17 knots); the old protected cruisers *Hamidieh* (3800 tons) and *Medjidieh* (3400 tons); 9 small torpedo boats of 100 to 200 tons; 9 gunboats of 200 to 500 tons; an armed yacht, and several motor boats. The vessels in 1924 were all in urgent need of repairs, which were to be made at the naval dockyard at Constantinople. This yard was being repaired, refitted, and improved by British shipbuilding companies.

**United States.** The only vessels under construction for the navy in 1924 were: 2 large aircraft carriers (*Lexington* and *Saratoga*, commenced as battle cruisers); 2 light cruisers of 7500 tons; 2 destroyer tenders; and 3 fleet submarines. The programme of new construction presented to Congress by the Secretary of the Navy consisted of 8 light cruisers of 10,000 tons, 6 light-draft gunboats for use on Chinese rivers, and 3 large submarines. The vessels of the navy in 1924 were: 3 battleships of 32,600 tons (8 16-inch guns, 21 knots), 2 battleships of 32,300 tons (12 14-inch guns, 21 knots), 3 battleships of 32,000 tons (12 14-inch guns, 21 knots), 2 battleships of 31,400 tons (12 14-inch guns, 21 knots), 2 battleships of 27,500 tons (10 14-inch guns, 20.5 knots), 2 battleships of 27,000 tons (10 14-inch guns, 21.5 knots), 2

battleships of 26,000 tons (12 12-inch guns, 21 knots), 2 battleships of 21,825 tons (12 12-inch guns, 21.5 knots); 3 armored cruisers of 14,500 tons, 5 of 13,680 tons, 2 of 9700 tons, 1 of 8200 tons; 10 light cruisers of 7500 tons and 34 knots, 3 of 3750 tons and 25 knots; 7 protected cruisers of 3200 to 3500 tons; 8 gunboats of 1000 to 1575 tons; 3 large mine-layers; 17 submarine and destroyer tenders; 2 aircraft carriers; 1 airship tender; 6 repair ships, 3 supply ships, 4 hospital ships, 25 fuel ships; also small gunboats, tugs, and miscellaneous vessels; 237 destroyers of about 1200 tons and 35 knots, 44 destroyers of 1000 to 1100 tons and 30 knots, 21 destroyers of 720 tons and 30 knots; and about 100 submarines.

The personnel of the navy in 1924 consisted of 7816 officers and 85,790 enlisted men. During the War there were 32,474 officers and 550,736 enlisted men. On June 30, 1923, there were 4222 officers in the Naval Reserve Force and about 11,000 men.

As regards matériel, the greatest needs of the navy in 1924 were: (a) repair of battleships; (b) more light cruisers; (c) some flotilla leaders; (d) large submarines for fleet service; (e) more aircraft. The repair of battleships includes an increased elevation of the turret guns in all except the very latest vessels, the application of thin armor to the upper deck as a protection against aircraft bombs, the application of bulges and compartmentation below water as a protection against torpedoes, and a general repair and refitting of hull and machinery, particularly the latter. In a spirit of mistaken economy, Congress and the demands of the budget cut the maintenance appropriations for the fleet until the sums allotted became wholly inadequate for the preservation of the vessels and machinery and still less adequate to secure efficiency. The deck armor, antitorpedo bulges, and the elevation of the guns were deemed necessary to place the battleships on the same plane of efficiency as the vessels of Great Britain and Japan. These repairs and changes could be effected without contravening the terms of the Five Power Naval Pact for the limitation of naval armaments. Compared with the British and Japanese navies, that of the United States in 1924 was particularly deficient in light cruisers. Of vessels of this type less than 10 years old, Great Britain had 47 of 243,240 tons and was building at least 7 more of about 10,000 tons each; Japan had 25 of 157,730 tons; and the United States had 16 of 75,000 tons. To preserve her parity with Great Britain, the United States needed 25 or more cruisers of 250,000 tons; and to hold her 5-3 ratio with Japan she needed 19 or more cruisers of 188,000 tons. Not less than 10 flotilla leaders and 10 large submarines were required. As to aircraft, the navy needed at least three times its force of 1924.

Fortunately for its efficiency, for its development along desired lines, and for its usefulness to the fleet and other naval purposes, the entire control of the naval air service was vested in the Navy Department. The Bureau of Aeronautics was established on Sept. 1, 1921. Before that date, naval aviation was divided between several different bureaus in a manner to prevent coördination of its various parts. The Bureau was carefully and thoroughly organized under its first chief, Rear-Admiral W. A. Moffett, and under his efficient guidance.

the naval air service greatly improved and continued to gain as rapidly as the insufficient appropriations permitted. As a demonstration of the efficiency of the service, United States navy fliers established, in 1923, 23 out of the 42 recognized world's records for aircraft performance. In October, 1923, the Bureau completed the *ZR1*, the first rigid airship of the Zeppelin type to be built in America. Christened the *Shenandoah*, it was subjected to many tests and trials, all but one of which it passed satisfactorily; while riding at its mooring mast a 72-mile gale drove with such force that its whole bow was torn off. The ship nevertheless weathered the storm and after 9 hours returned and was nosed into her hangar. The *Shenandoah* is 680 feet long, has a diameter of 78.7 feet, a gas capacity of 2,150,000 cubic feet, and is filled with helium. It is driven by 6 300-horse power Packard engines with a maximum speed of 75 miles per hour and a cruising speed of 65 miles. The crew consists of 9 officers and 22 men. For sectional diagram and illustration, see AERONAUTICS. Another airship of the Zeppelin type was built in Germany and was ready for delivery in 1924. It was styled the *ZR3*. It is 656 feet long, 90 feet 9 inches in diameter, and has a gas capacity of 2,475,000 cubic feet. In addition to rigid airships, the air service was equipped with nonrigid dirigibles, kite balloons, free balloons, seaplanes, airplanes of land types, torpedo-planes, etc. One of the most interesting of the seaplanes was the *MS1*, designed for use by submarines. It had an all-metal body and was of such small dimensions that with wings folded it could be stowed in a little compartment immediately below the deck of the submarine. This compartment was not water-tight, but water would not injure the plane. It could be hoisted out and made ready in a few minutes. It takes off from the water and on return descends to the surface alongside the submarine. See VESSEL, NAVAL; BOMBING OF VESSELS; WAR IN EUROPE, *Naval Operations*.

**NAVIGATION.** The art of navigation was greatly improved in the decade 1914-24 by the invention of new devices and the further development of old ones. The net result was increased safety for shipping, especially in the vicinity of land, and greater ease and economy in handling it everywhere. The most noteworthy of the devices were the radio compass, sonic sounding, the gyro-pilot, cable steering, the earth induction compass, and the auxiliary rudder.

**Radio Compass.** This is a device for the reception of the electromagnetic waves used in radio telegraphy and for determining the direction of their source. Its operation is based on the fact that radio waves have most effect on an antenna or loop when its plane is in the direction of the propagation of the waves. If the waves are not deflected by intervening land or other objects, the plane will point toward the source. Great care is taken to prevent such deflection, but some always exists. This is eliminated from the final result in well-placed and carefully screened stations by determining a curve of error which gives the proper correction to apply to each observed bearing. The compass itself consists of a vertical coil pivoted on a vertical axis rising from the centre of a dumb compass which is set with its zero pointing north. The operator rotates the vertical coil until in the position which gives

the minimum of sound in the head 'phone. The pointer over the dumb compass then gives the direction of the transmitting station, subject to correction for error. Radio compasses are installed on board ship as well as ashore, but the shore stations give the best results, as the deflecting objects on large vessels are numerous and troublesome. A ship may thus determine the direction of a shore station, or a shore station may determine the direction of a ship and give her the information by radio. Simultaneous reports from two shore stations may be plotted on a chart; gnomonic projection must be used if over 50 miles away; and the exact location of the ship may be determined, a most important matter in a heavy fog. A large number of shore stations, established on the east and west coasts of the United States and on the Great Lakes, are of great use in foggy weather or when a ship is beyond visual range of definable shore objects but within 150 miles of a compass station.

**Sonic Sounding.** Deep-sea sounding was until late in the decade effected by means of a long wire and a detachable sinker. The sonic sounding apparatus or automatic depth recorder was developed and perfected by Dr. Harvey C. Hayes, sound aide and physicist of the Naval Experiment Station at Annapolis, Md. It consists of an oscillator mounted in a tank in the stern of the ship and a hydrophone installed in the bow. Wires from both lead to the bridge or charthouse. Oscillator sound signals are made by the operator. The sound wave, traveling about 4840 feet per second, goes to the ocean bed, is reflected back, and is caught by the hydrophone receiver which measures the elapsed time. This time interval, referred to a scale, gives the depth in fathoms. The United States Navy was the first to put the device to practical use. The U.S.S. *Stewart* ran a line of soundings from Newport, R. I., to Manila, P. I., and other naval vessels did similar work in the Atlantic and Pacific Oceans. Apparatus of this sort will probably be applied in the near future to all large vessels as its value is so great they cannot afford to be without it.

**Earth Induction Compass.** This is an instrument devised by Dr. L. J. Briggs and Dr. Paul R. Heyl of the United States Bureau of Standards. It is a development of their airplane compass but is larger and driven by an electric motor instead of wind cups. Two direct currents are generated by revolving two pairs of brushes at a velocity of 1400 revolutions per minute in the magnetic field of the earth. The instrument is so adjusted that when it is set for a compass bearing, the currents flowing from both pairs of brushes are equal and produce no effect on a galvanometer. If the instrument turns even slightly, one current becomes stronger, and the dial needle is deflected. On board ship the generator is placed aloft or as far as possible from the magnetic field of the ship, but the control is in any convenient location. This compass, including its fittings, is comparatively inexpensive.

**Radio Pilot Cable.** A method of keeping a ship in the channel during a heavy fog was tested in the Ambrose Channel leading into the New York harbor. It consists of an electric cable through which flows an alternating current. Ships intending to use the cable are provided with a pair of coils, each connected to a galvanometer.

By noting when the currents in the coils are equal, the navigator can determine when he is astride the cable and can keep over it. For regular service two cables are laid, one for incoming and one for outgoing vessels, carrying currents of different frequency.

**Gyro-Pilot.** This apparatus, designed and developed by Elmer A. Sperry, the inventor of the Sperry gyro-compass, is a device for automatically steering a ship on any desired course. The course is set on the gyro-compass, and the gyro-pilot not only takes the place of the helmsman in steering but notes each yaw of the vessel as it begins and anticipates the movement by helm change more quickly than a helmsman can. Moreover, it takes cognizance of the speed of the yaw, when increasing and when dying away, and corrects the rudder angle accordingly. The sum total of its efficiency is considerable. It reduces the angle of yaw and the necessary helm angle, on both counts effecting an increase of speed with the same power, and in reducing the yaw cuts down the distance which the ship travels in steering a course between two fixed points.

**Flettner Rudder.** This is a German invention designed to do away with expensive steering gears and to replace them by a simple form of rudder worked by the streamline pressure exerted on the rudder by the water through which the vessel is moving. This is accomplished by a small auxiliary rudder or deflector which is set in a long jog in the after edge of the main rudder and operated independently of it. The combined effect of the deflector and the current of water imparts to the main rudder a large turning movement enabling it to act with prompt and efficient steering effect.

**NEAR EAST RELIEF.** An organization incorporated by Congress in 1919 for the purpose of affording relief to sufferers in Armenia, Syria, the Russian Caucasus, Mesopotamia, Egypt, Palestine, Macedonia, and other countries. Conditions in these countries in 1919 were characterized by Herbert Hoover as "the most desperate in the world." This was largely due to the fact that the Red Cross did not maintain any relief system in them. The organization succeeded the Armenian and Syrian Relief Commission. Over 7000 tons of flour were distributed per month. It was reported that there were 1,200,000 destitute adults and 250,000 homeless children in the areas affected. Col. William N. Haskell assumed charge of all operations and expenditures in 1919. In 1920 the work of the organization extended from Egypt to the Caucasus and from Constantinople to Mesopotamia and Persia. From northern Turkey, over 500,000 Armenians had escaped to the Russian Caucasus; they were in a destitute condition. In Egypt and elsewhere, hundreds of refugees had settled, and in Persia, as a result of famine in 1917-18, thousands were suffering for the necessities of life. By the end of 1920 more than \$42,000,000 had been spent by the organization. The work represented the literal saving from death of hundreds of thousands. The largest and most important service was the work among the children. In 1920 the organization cared for more than 100,000 children, the majority of them in orphanages and the others in soup kitchens and clinics. Conditions were intensified by the fighting in the Caucasus and western Turkey in 1921. Down to the end of 1922 it was estimated that

1,000,000 women and children had been saved from starvation through the efforts of the Relief. Three hundred American workers were employed, besides hundreds of native helpers. At the end of 1922 38 hospitals, 59 clinics, and 124 orphanages were maintained. The total expenditure to July, 1924, was about \$78,000,000. Invaluable service was rendered at the destruction of Smyrna, where assistance was given to the thousands of refugees escaping to Greece and elsewhere. In 1923 the Near East Relief concentrated its activities on a child-welfare programme. During the year, on account of the forced evacuation of minority populations at Anatolia, emergency work for adult refugees was carried on at Mediterranean and Black Sea ports. This included feeding and medical service and resulted in the saving of at least 100,000 lives, chiefly of women and children. Over 22,000 orphans were safely transferred from the interior of Anatolia to new institutional homes in Syria, Palestine, and Greece.

In 1924, the organization was operating 39 orphanage centres and 62 hospitals and clinics in six countries. Its agricultural demonstration projects in Syria, Greece, and Armenia employed 23,000 acres. Industrial training schools in Syria, Greece, and Palestine were teaching 35 trades to 30,000 children.

**NEBRASKA.** Nebraska is the fifteenth State in size (77,520 square miles) and the thirty-first in population; capital, Lincoln. The population increased from 1,192,214 in 1910 to 1,296,372 in 1920, a gain of 8.7 per cent. The white population rose from 1,180,293 to 1,279,219; negro, from 7689 to 13,242. The State has a very large proportion of native white inhabitants, and these increased from 1,004,428 in 1910 to 1,129,567 in 1920. The foreign-born whites, on the other hand, decreased from 175,865 to 149,652. Both urban and rural populations showed an increase, the former from 310,852 to 405,306, and the latter from 881,362 to 891,066. The growth of the principal cities was as follows: Omaha (q.v.), 1910, 124,096; 1920, 191,601; Lincoln, 43,973 to 54,948; Grand Island, 10,326 to 13,947.

**Agriculture.** As Nebraska is one of the great agricultural States, conditions in the decade 1910-20 reflected the fluctuations in prices and production which resulted from War and post-war conditions. (See AGRICULTURE.) While the population of the State in the decade increased 8.7 per cent, the number of farms decreased 4.1 per cent (from 129,678 in 1910 to 124,417 in 1920). The acreage in farms in 1910 was 38,622,021, compared with 42,225,475 in 1920, an increase of 9.3 per cent; the improved land in farms likewise showed an increase from 24,382,577 acres to 23,109,624, or 5.2 per cent. The percentage of land used for agricultural purposes increased from 78.6 in 1910 to 85.9 in 1920, but the percentage of improved farm land fell from 63.1 to 54.7 per cent. The total value of farm property showed an apparent increase from \$2,079,818,647 to \$4,201,655,992, or 102 per cent; the average value per farm, from \$16,038 to \$33,771, or 110.6 per cent. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of

the total of 124,417 farms in 1920, 69,672 were operated by owners, 1315 by managers, and 53,430 by tenants. The comparative figures for 1910 were 79,250, 987, and 49,441. White farmers numbered 124,033 in 1920 and 129,216 in 1910, the native white farmers increasing from 93,509 to 99,441, while foreign-born farmers decreased from 35,707 to 24,592. Of the 384 colored farmers in 1920, 260 were Indians. Farms free from mortgage in 1920 numbered 27,065, compared with 47,435 in 1910; those under mortgage, 35,191, compared with 30,839. The number of dairy cows in 1920 was 516,716, compared with 613,952 in 1910, a decrease of 15.8 per cent; "beef cows," 1,121,564, compared with 705,191, or an increase of 59 per cent; hogs, 3,435,690, compared with 3,435,724; sheep, 573,217, compared with 240,116. The estimated production of the chief farm crops in 1923 was as follows: corn, 257,418,000 bushels; spring wheat, 3,560,000; winter wheat, 28,220,000; oats, 86,977,000; rye, 1,584,000; barley, 9,586,000; potatoes, 9,912,000; hay, 3,352,000 tons; and sugar beets, 541,000 short tons. Comparative figures for 1913 are: corn, 114,150,000 bushels; wheat, 62,325,000; oats, 59,625,000; rye, 1,740,000; barley, 1,760,000; potatoes, 5,664,000; and hay, 1,675,000 tons. The apple crop in 1919 was 907,224 bushels valued at \$1,905,175, as compared with 3,321,073 bushels valued at \$1,612,765 in 1909.

**Manufactures.** Nebraska is not one of the leading manufacturing States. It has, however, five cities with more than 10,000 inhabitants, which in 1920 contained 21.8 per cent of the State's total population and in 1919 reported 81.7 per cent of the State's manufactured products. There were in the State, in 1909, 2500 manufacturing establishments; in 1914, 2492; and in 1919, 2884. Persons engaged in manufacture numbered 31,966, 33,695, and 49,076; and the capital invested amounted to \$99,901,089, \$121,007,944, and \$245,256,684, in those years. The value of the products in 1909 was \$199,018,579; in 1914, \$221,615,848; and in 1919, \$506,042,498. The large increase in value of the products between 1914 and 1919 was due largely to the change in industrial conditions brought about by the War and cannot properly be used to indicate the growth in manufactures; but the increase in number of wage earners and in number of establishments indicates clearly a decided growth in the manufacturing activities of the State. The principal manufacturing city is Omaha, which had, in 1909, 432 manufacturing establishments, with a product valued at \$60,855,000; 1914, 417, with \$66,438,000; and in 1919, 561 with \$452,237,000. Lincoln is also important industrially, having, in 1909, 167 manufacturing establishments, with a product valued at \$7,010,000; in 1914, 195 with \$10,025,000; and in 1919, 210 with \$23,368,000.

**Education.** The passage of several legislative acts during the decade 1914-24 did much to improve educational conditions in Nebraska. This is especially true of the latter part of the period. The Legislature of 1919 passed a certification law standardizing the issue of teachers' certifications by establishing specific legal requirements; a law redistricting the State for the purpose of forming consolidated school districts; and a third making citizenship a necessary requirement for teachers in all public, private, denominational, and parochial

schools. The Legislature of 1921 made it mandatory for every school district of the State to provide a minimum term of 9 months when it can be supported on a levy of \$.008 on \$1 of the actual assessed valuation of the school district. The four State normal schools were designated as teachers' colleges by the 1921 Legislature and were authorized to confer the bachelor's degree on students completing the four years' college course. Midland College changed its location from Atchison, Kan., to Fremont, Neb., and Bellevue College, formerly at Bellevue, Neb., was discontinued. The average daily attendance in the schools in 1923 was 253,955, compared with 214,152 in 1914. The total expenditure for public schools for 1923 was \$29,935,549. Illiteracy in the State decreased from 2.5 per cent in 1910 to 1.8 per cent in 1920: among the native white population, from 0.8 to 0.5; among the foreign-born white, from 7.1 to 6.6; and among the negro, from 8.5 to 5.7.

**Finance.** For finance, see STATE FINANCES. **Political and Other Events.** During the decade 1914-24, Nebraska was one of the doubtful States, and control was balanced closely between the Democratic and Republican parties. In 1914 John H. Morehead, the Democratic candidate, was elected governor, and the Democrats elected their candidates for Congress in three districts and the Republicans theirs in the others. A woman suffrage amendment was defeated in this election, and so were several other proposed amendments. In 1916 the State was Democratic, both nationally and locally. Keith Neville, Democratic candidate, was elected governor, and Gilbert M. Hitchcock was reelected to the Senate. In the voting for President in this year, President Wilson received 158,827 votes; Charles E. Hughes, 117,771. At this election a prohibition amendment was carried. At State elections in 1918, the Republican nominees were elected to the Legislature by large majorities. Samuel R. McKelvie was elected governor. An amendment to the constitution was adopted, depriving so-called "first paper declarants," six months resident in the State, of the right to vote. The voters also decided in favor of holding a convention to draft and submit a new State constitution. In October, 1919, there was serious rioting in Douglas County during which the county court house was damaged by fire, with a loss of nearly \$1,200,000. The trouble arose from the attempts of the mob to force the sheriff to turn over to them a negro prisoner. The negro was seized by the mob and hanged. In 1920 Governor McKelvie was reelected. In the voting for president in this year, Warren G. Harding received 247,498 votes; James M. Cox, 119,608. During 1920 a constitutional convention adopted 41 amendments to the constitution which were voted on in a special election on September 22. The most important of these amendments were as follows: The English language was required as a teaching medium in all common schools. The governor was given the power to appoint heads of the executive department, with the consent of the majority of both houses. A budget system was created. The concurrence of five out of seven judges of the Supreme Court was made necessary for declaring a law unconstitutional. No appropriations are made to educational institutions not owned and controlled by the State. In the elections of 1922,

the Democrats were successful. Charles W. Bryan, brother of William J. Bryan, was elected governor. Robert B. Howell, Republican candidate, was elected United States Senator, defeating Gilbert M. Hitchcock, Democrat. The Republicans elected a majority in both houses of the Legislature. Governor Bryan was inaugurated in January, 1923. In the nominating primaries in 1924, Senator Norris, Republican, was renominated. Charles W. Bryan was renominated by the Democrats for governor and Adam McMullen by the Republicans.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1917 arranged for the submission of an amendment providing for a revision of the State constitution. The right of women to vote was affirmed for all elections not already specified in the State constitution. Provision was made for the election of the judiciary and certain school officers by non-partisan ballots. A special session of the Legislature was held in 1918 to deal with issues arising from the War. The so-called Mockett Law, under which the teaching of German was made compulsory in the schools, was repealed. The Legislature in 1919 passed a measure consolidating several boards and commissions under the governor, with the purpose of unifying the administration and doing away with duplications and overlapping jurisdiction. The banking laws were amended and so were the "blue sky" law and the workmen's compensation law. A bill was passed for the erection of a new State capitol. The Legislature ratified the Federal prohibition amendment, Jan. 16, 1919, and the Federal woman suffrage amendment, Aug. 2, 1919. The Legislature of 1921 passed measures designed to prohibit aliens' acquiring title to land in the State; provided for the preparation and presentation of a State budget and for the establishment of coöperative associations; and declared English the official language of the State, prohibiting discrimination against its use by religious and social bodies. The school age was raised from 14 to 16 years under certain conditions and the age of minority for women to 21 years. A special session of the Legislature was held in April, 1922, to reduce the appropriations made by the Legislature of 1921, in order to avoid the excessive collection of taxes. The total amount of reductions made was about \$2,500,000. In 1923 the Legislature passed a measure forbidding the marriage of persons afflicted with certain diseases.

**NEBRASKA, UNIVERSITY OF.** A coeducational State institution at Lincoln, Neb., founded in 1869. With the exception of the war years the student enrollment increased steadily from 4133 in 1914 to 5651 in the year 1923-24, with 2569 in the summer session of 1923, not including students of noncollegiate rank and those enrolled in extension courses. The faculty increased correspondingly during the period from 283 to 368 members, and the library from 111,000 to 175,000 volumes. The income of the university rose from \$1,000,000 to approximately \$3,000,000. Many new buildings were put up. An animal pathology laboratory was built in 1918 and a special State appropriation made available for research in animal diseases. During 1919 and 1920 the following buildings were erected or acquired: on the city campus, Social Sciences Hall, Teach-

ers' College building, Ellen Smith Hall, the chancellor's residence, seven students' houses; on the farm campus, an agricultural engineering building and an animal pathology and hygiene building and a barn; at the Medical College at Omaha, a new laboratory building, nurses' home, and a steam plant. A photographic studio was also added in 1921 and in 1923 a beef cattle barn and a new stadium for athletics and public exercises. Chancellor, Samuel Avery.

**NEBULÆ.** See ASTRONOMY.

**NEGRI SEMBILAN.** See MALAY STATES, FEDERATED.

**NEGRO IN AMERICA.** See NEGRO MIGRATION; UNITED STATES, *Population*; LYNCHINGS; and RACE PROBLEMS IN THE UNITED STATES.

**NEGRO MIGRATION.** Following 1916, the northward movement of the southern negro, which had been fairly constant from the close of the Civil War, showed a remarkable increase. Previous to that year negroes in the North had been entirely excluded from most occupations; about three-fourths of the colored workers were employed in domestic personal service; they commanded only poor wages and were largely shut off from the benefits of labor organization. With war-time conditions came a marked broadening of their industrial opportunities. On account of the labor shortage produced by the check to European immigration and the expansion of industry to meet war-time demands, northern employers found themselves compelled to take on negro labor. This was, beyond question, the immediate cause of the conspicuous growth in the migration northward. At the same time unrest among negroes in the South and other influences contributed to this movement. In 1918 the total northward migration for the preceding few years was placed between 500,000 and 600,000. This wholesale movement was checked for a time after the War came to an end, although many negroes insisted on coming North even when they were warned that only unemployment awaited them. It began again in 1921 and increased through 1922 and 1923. In addition to his war-time experience, the negro had been used to a limited extent as strike-breaker in the steel, building trades, railroad shop, and packing house strikes, where he had an opportunity to prove and to learn his value in industry. Whereas in the South 57.7 per cent of the total number of male negro workers were employed in agriculture, only 5.7 were so engaged in the North in 1920. Moreover, instead of working in hotels, restaurants, office buildings, and domestic kitchens, most of them had become industrial laborers in mills, factories, and stockyards. In Chicago the negro was represented by large or small numbers in practically all the principal occupations. In some cases they had risen to foremanship over men of their own race. Negro women, to a less extent, were being employed in a widening variety of industrial processes. Although in general negroes were not admitted to unions and were employed at lower rates than white workers, in some cases they were asking equal pay for equal work and were joining trade unions where these were open to them. More than all this, perhaps, the negro was finding in the North a freer social and political life with increased educational advantages.

This increased northward migration continuing, the farm labor situation in the South became alarming by the spring of 1923. A temporary reduction in the crop acreage was found necessary. The United States Department of Agriculture, on investigation, found that Georgia had lost, within a year, 32,000 negro farm workers, or 13 per cent of the total number of negro farm workers in that State; Alabama had lost 10,000 or 3½ per cent; South Carolina, 22,700, or 3 per cent; Arkansas, 15,000, or 3½ per cent; Florida, 2, and Louisiana, 1 per cent; besides the negro workers who had been lost to mining, lumbering, manufacturing, and domestic service. According to a study of the census figures, made by the United States Bureau of the Census, the net direct loss to the South through negro migration up to the year 1920 had been 733,571, or approximately 8.2 per cent of its total negro population. The first measure taken in the South to check the movement was rigorous legislation to control emigrant labor agencies; payment of a license fee was required, in some cases as high as \$2500, with jail sentences for evasion. The attempt was ineffectual. Higher wages on farms and in factories were offered, improvements were made in school and housing conditions, and efforts were put forth toward securing for the negro equality before the law and an abatement of mob violence, and for some measure of social coöperation between the races. All of this resulted in a betterment of conditions for the negro who remained, but the marked movement to the North continued. The number leaving the South in the year ending Sept. 1, 1923, according to the Department of Labor, was 478,100; the loss by States was as follows: Georgia, 120,000; Alabama, 90,000; Florida, 90,000; Mississippi, 82,600; North Carolina, 25,000; South Carolina, 25,000; Louisiana, 15,000; Tennessee, 10,000; Virginia, 10,000; Arkansas, 5000; Kentucky, 2500; Texas, 2000; and Oklahoma, 1000. To a much larger extent than ever before, the migration came from the far South. Latterly an increasing number of Mexicans were being brought in to meet the farm labor shortage.

The effect of this migration on the population of the North was conspicuous in the census figures. From 1870 to 1910, the average decennial increase of southern negroes in the North was 67,000; in 1910-20 the increase was 321,890, or more than the aggregate increase of the preceding 40 years. In 1910 the negroes had constituted about 1.9 per cent of the total population of the North, at which point it had been fairly constant since 1870; in 1920, their proportion had increased to 2.3 per cent. This increase, however, though striking, was not enough in itself to make the negro a disturbing factor in the North. Where trouble arose it was from the unequal distribution of the negro population. Nine States, holding 72.7 per cent of the total population of the North, accounted for 91.4 per cent of the total negro population of that territory (Pennsylvania, 284,568; New York, 198,483; Ohio, 186,187; Illinois, 182,724; Missouri, 178,241; New Jersey, 117,132; Indiana, 80,810; Michigan, 60,082; Kansas, 57,925). Most serious was the concentration in the large cities; New York, Chicago, and Philadelphia, for example, contained 26.9 per cent of the northern negroes, as compared with 15.9 per cent of the total population. The influx of

negroes to the larger cities appeared to be taking on flood proportions. In protest against the employment conditions resulting from the movement, East St. Louis rioted in 1917. Serious race riots broke out in Chicago, in 1919, in which there were killings on both sides. There were disturbances in Omaha and Washington. These outbursts of race feeling were precipitated largely, it was claimed, by sensational newspaper publicity, and in Chicago in particular by the difficulties of insufficient housing. It being realized, however, that lack of understanding and coöperation between the races was the crux of the situation, and that this was only being aggravated by political as well as social segregation, there was appointed in 1918, under the Federal Department of Labor, a director of negro economics, to ease the friction. Negro advisory committees, composed of representative white and colored citizens, were established throughout the South and in various northern centres, constituting agencies in which the two elements might work together toward a mutual understanding. In industry, the negro immigration was in a limited measure taking the place of the foreign-born as a source of labor supply for shops and factories. There had been fewer cases of open hostility between white and colored labor than had been anticipated; requests for separate facilities had not been frequent. The American Federation of Labor made an effort to prevent the drawing of the color line in the unions; and when several international and local unions refused to accept this principle, it provided in 1920 that where internationals refused to admit colored workers to membership, organization would be authorized under a charter of the Federation. The Federation also sent an organizer to work among the negroes in the South. The attitude of the white worker in general seemed to be that while he was averse to the negro in industry, still, since the negro had come, it was better to have him organized. It was noteworthy that during the Chicago riots, the organized white workers in the packing houses guaranteed that there would be no trouble between them and the negro workers. See LYNCHINGS.

**NEIHARDT, JOHN GNEISENAU** (1881- ). An American writer, born at Sharpsburg, Ill. He studied at the Nebraska Normal School and from 1901 to 1907 lived among the Omaha Indians to study their character and history. His books include *The Divine Enchantment* (1900); *The Lonesome Trail* (1907); *The Dawn Builder* (1911); *The Quest*, poems (1916); *The Song of Three Friends* (1919); and *Two Mothers*, a drama (1921). *The Song of Three Friends* was awarded a prize by the Poetry Society of America as the best volume of verse of 1919. He edited several collections of verse and contributed frequently to magazines. From 1912 he was literary critic of the *Minneapolis Journal*.

**NEJD**, EMIRATE OF. See ARABIA.

**NELSON, KNUTE** (1845-1923). An American lawyer and legislator (see VOL. XVI). He was a member of the Senate for five successive terms and was reelected for the term ending 1925. At the time of his death, on Apr. 28, 1923, he was the oldest member of that body in point of service. He died on Apr. 28, 1923.

**NEO-LAMARCKIAN THEORY**. See HEREDITY.

**NEPHRITIS**. Ideas of the nature of

Bright's disease underwent much change in the decade 1914-24. Thus it was pretty well shown through experiment that nephritis does not represent a poisoning through the exposure of the organs in eliminating toxic material. This kind of injury, which may be studied in actual poisoning by mercury and oxalic acid, bears no resemblance to ordinary nephritis. The latter may usually be traced to a focus of infection somewhere in the body, as in the teeth or tonsils, while the organs are also attacked by the germs and their toxic products in various general infections. No doubt dietetic and other abuses may lower the resistance of the organs to infection. Passage of the prohibition amendment in the United States had not secured any lowering of the mortality of Bright's disease up to 1924, and it must be borne in mind that chronic disease of vital organs late in life is common among the clergy as well as in other abstinent classes of mankind.

The old distinction between medical and surgical nephritis is no longer upheld, for a unilateral nephritis, once thought to be the necessary result of mischief lower down in the urinary tract, may be found due to a blood infection. There seems to be very little difference between the causal factors in nephritis proper and those of disease of the kidney and the pelvis, perinephritis, and even stone in the kidney; for focal infection may be traced in all of them. Under diagnosis the practice of microchemical analysis of the blood will give the best idea of the functional efficiency of diseased kidneys. Convulsions seen in uræmia are no longer regarded as the result of retained toxic material in the blood but as that of increase in intracranial pressure. For the relief of nephritis wonders may be accomplished by proper diet, as in the case of the disappearance of dropsy on a diet very poor in salt.

**NERNST DISTRIBUTION LAW.** See CHEMISTRY, PHYSICAL.

**NERNST HEAT THEOREM.** See CHEMISTRY, PHYSICAL.

**NETHERLANDS, THE, or HOLLAND.** A kingdom situated on the North Sea, lying between the Kingdom of Belgium on the south and west and Germany on the east. Its area is 13,205 square miles, of which 617 consist of water. The population in 1923 was 7,086,913 (49.64 per cent male and 50.36 per cent female), an increase of 109,483 over the census of 1921 and 221,599 over that of 1920. The density of population per square mile amounted to 652.99. The urban population constituted 45.66 per cent of the whole, and the rural 54.34 per cent. Emigrants in 1922 amounted to 2158, of whom 1912 departed from Dutch ports for North America, 195 for South America, and 47 for Africa. The royal family and most of the inhabitants were members of the Reformed Church, which was under Presbyterian government, but complete liberty of conscience was granted to all religions. At the end of 1920, there were 2,826,633 adherents of the Dutch Reformed Church; other Protestants numbered 832,164; Catholics, 2,444,583; Jansenists, 10,461; Jews, 115,222; other known creeds, 635,241. The chief cities with their population in 1923 were: Amsterdam, 700,303; Rotterdam, 535,033; The Hague, 367,667; Utrecht, 146,976; Groningen, 94,217; and Haarlem, 80,383.

**Agriculture.** The total area of agricultural

land (in hectares; 1 hectare=2.47 acres), in 1922 was 2,229,413 (in 1913, 2,186,591); arable land, 902,266 (27.61 per cent; 882,255 hectares in 1913); meadows, 1,231,052 (37.67 per cent; 1,221,876 in 1913); gardens and orchards, 96,095 (2.94 per cent; 81,460 in 1913); forests, 248,208 (7.6 per cent; 257,939 in 1913); uncultivated land, 466,066 (14.26 per cent; 515,143 in 1913).

against 197,615 in 1922; this, too, was exported principally to Great Britain.

**Mining and Manufacturing.** Mining was limited in the Netherlands to coal mining in the province of Limburg. The coal production was estimated at 5,500,000 metric tons for 1923, against 4,570,000 for 1922 and 3,018,000 in 1917. In 1923 there were 933 dairies. The production of butter in 1922 amounted to 64,633,000 kilograms, and of cheese, 97,621,230 kilograms. The beet sugar refineries numbered 21 in 1922, while the total sugar production amounted to 175,331 metric tons for 1922-23. In 1922 there were 33 potato flour factories, 18 cardboard factories, and 16 margarine factories. The latter produced 87,902,720 kilograms of margarine.

**Communications.** Length of railways in 1923 was 3671 kilometers; in 1922, 3428; in 1910, 3215. The estimated receipts were 120.43 florins per kilometer for 1923, as against 130.87 florins for 1922. In 1923 there were 666 steamers (2,398,618 gross registered tons), against 664 for 1922 (2,164,739 gross registered tons); motor and motor sailing vessels, 80 (63,940 gross registered tons), against 73 for 1922 (51,351 gross registered tons).

Leading imports from the United States for 1923 (in 1000 guilders) were wheat, 33,970; raw cotton, 28,092; corn, 22,157; linseed cake, 20,992; wheat flour, 20,992. Leading exports to the United States were flower bulbs, 9560; rubber, 3885; silk, artificial yarns, 3590; quinine and other salts, 3018; chincona bark, 2392.

**Finance.** The national debt, consolidated (Jan. 1, 1923), was 2,828,319,550 guilders; floating (December, 1923), 648,856,000 guilders, of which 102,256,000 were advanced to the colonies, against (December, 1922) 805,937,000 guilders, of which 323,750,000 were advanced to the colonies.

The following indicates currency in circulation:

| Date          | Gold    | Silver | Note Circulation |
|---------------|---------|--------|------------------|
| Dec. 31, 1922 | 581,790 | 9,074  | 969,251          |
| Dec. 31, 1923 | 581,787 | 8,674  | 1,031,279        |
| Feb. 4, 1924  | 581,713 | 10,120 | 1,030,419        |

The exchange for the dollar (par, 2.488 guilders to \$1) was in December, 1922, 2.51; in December, 1923, 2.63; on Feb. 2, 1924, 2.65. The wage index (January, 1914 = 100 for five cities and 14 classes of workers) was 246.4 for July, 1923, against 265.2 for July, 1921, and 252.3 for January, 1923. The average hourly wage (first half of 1923 in 14 industries of Amsterdam, in Dutch cents) was: skilled, 83, semi-skilled, 70; unskilled, 69. Municipal wages (1923) were: miners (below the surface) 6.43 florins per shift; (above the surface) 4.33 florins per shift; gas workers, 0.76 florin per hour; electrical workers, 0.80 florin per hour; metal workers, 0.62 florin per hour; building workers: masons, 1.09 florins per hour; carpenter, 1.01 florins per hour; assistant mason, 0.92 florin per hour; gun workers, 0.75 florin per hour; munitions and explosive workers, 0.68 florin per hour; construction workers, 0.81 florin per hour. Collective wage agreements numbered 498 for January–November, 1923, against 500 for 1922. Strikes and lockouts were 257 for January–November, 1923, against 308 for 1922. There were 3883 commercial failures for January–November, 1923, against 3403 for 1922. Unemployed workers numbered 102,225 on Dec. 31, 1923, against 106,528 on Dec. 31, 1922, principally in the metal and building trades; a total of 110,268 sought unemployment aid on Jan. 26, 1924. The wholesale price index (1913 = 100 for 48 articles) was 151 for 1923, against 160 for 1922 and 182 for 1921. The retail price index (1913 = 100 for 17 articles in six cities) was 145 for 1923, against 157 for 1922 and 179 for 1921.

**History.** The political history of the Netherlands during the War was the familiar tale of neutral nations: to remain aloof from the struggle by word and deed, to render what aid was possible to the unfortunate victims of the War, to carry on the usual international relations as far as might be, and at the same time to supply the daily wants of the population in spite of the sadly disrupted state of the world, were the concerns of the Dutch in the years 1914–18. The outbreak of the War brought the whole military strength of Holland into the field. By Aug. 4, 1914, 200,000 men were under arms, and as hostilities progressed and the work of policing the coasts and the frontiers increased, more units were called up, so that at its height the Dutch army totaled 400,000 men. The expense, necessarily, was enormous for so small a country. In December, 1914, a loan of \$100,000,000 had to be floated to meet the costs of the establishment. In all a debt of more than \$750,000,000 was incurred which could be wholly attributed to the War, i.e. for the upkeep of the army and navy, the care of refugees and interned soldiers, etc. The martial character of the country became more striking year by year. In 1915 all workmen engaged in the manufacture of munitions were placed under martial law, and a check was put on their goings and comings;

later in the year, the ever-present threat of invasion prompted the government to declare a state of siege in some of the communes of north Holland and also in some parts of Amsterdam. Not until the Armistice did Holland dare relax her vigilance, and then the threat of mutiny among the soldiers hastened demobilization sooner than the government might have wished. The problem of the returning soldiers, in view of the disorganization of industry and the dearth of housing, contributed greatly to the trials of the state. The feeding of the population and the providing of industry with the raw materials necessary for its operation were perhaps Holland's most pressing problems. Normal activity was dependent on keeping the regular channels of trade clear. Having become a country of truck farmers and cattle breeders, Holland of necessity depended on Germany for her coal and iron and on France, Great Britain, and the United States for her foodstuffs and textiles. A brisk overseas and land trade was carried on with all these as well as with Switzerland, Italy, and Austria-Hungary. The War curtailed intercourse on land, except with Germany; and the British blockade and the German submarine policy as well as American seizure of Dutch ships in 1918 played havoc with the Dutch merchant marine. More and more, Holland was put at the mercy of belligerents, and only the conclusion of the War checked the progress of the famine gripping her people. Extraordinary administrative measures had to be taken. In 1914 and 1915 the export of cereals and flour, cotton, rice, and linseed was prohibited. In 1915 the Netherlands Overseas Trust was formed for the purpose of handling imports. Before Great Britain and France would give their consent to the maintenance of the usual trade relations, it was necessary for the Trust to give assurances that the articles imported would not be reshipped to Germany. In 1916 the scarcity of flour forced the prohibition of the baking of white bread; maximum prices for cereals were fixed. The dislocation of trade with the Dutch East Indies compelled the government to maintain a strict surveillance over the distribution of foodstuffs and fodder. What little prosperity there was grew out of the maintenance of relations with the Central Powers; Germany and Austria took Holland's vegetables and dairy products, and Germany, in turn, sent coal and iron.

In a situation of such complex relations the rise of irritations and misunderstandings was inevitable. Clashes with Germany and the Allies were frequent. During 1915–17, notes were interchanged frequently with Germany over the violation of Dutch neutrality by the landing of airships, the stopping of merchant vessels, and the mining and torpedoing of Dutch ships; in 1918, feeling ran high over the British and American seizure of Dutch ships. And yet, in spite of vexations of this character and personal distress due to the hardships of the War, the Dutch worked unsparingly in the interests of their less fortunate neighbors. The invasion of Belgium sent into Holland some 1,200,000 refugees who were clothed and fed for varying lengths of time. By the end of the War there were still about 30,000 such refugees partaking of the hospitality of the Dutch. Interned soldiers at times numbered as many as 50,000, most of them Belgians, but also many Russian and German deserters. The Dutch Red Cross

did yeoman work in facilitating the exchange of British and German prisoners. In all these humanitarian activities the government must have expended \$25,000,000, while private contributions easily reached a similar amount.

These preoccupations did not check civil and political developments of extraordinary importance. By the electoral reform act of Dec. 12, 1917, universal suffrage and proportional representation were established. Sex disabilities of women were likewise removed. In 1917, by a constitutional amendment, the government was ordered to provide for the upkeep of denominational as well as secular schools. As a result of an increasing labor agitation during the War, a series of enactments was promulgated in 1919 which aimed at better social and working conditions. By these laws, the eight-hour day was assured in factories and offices; workmen's insurance was extended to all industries except agriculture and navigation; the general supervision of health activities was turned over to a state health council; a council of labor was erected to advise generally all administrative departments in the conduct of labor affairs. But the inability of affairs to mend, in spite of paternalistic legislation, increased the insurgency of the labor classes. In 1918 and 1919, under the leadership of Troelstra, the Social Democrats pressed for a political revolution, some even demanding the abdication of the Queen. Continued hard times brought on a serious dock strike during February-April, 1920, and such outbreaks were frequent in the subsequent years. The threat of proletarian control forced the union of most of the elements of the Right with the result that a Catholic government was constituted in 1918, for the first time, under Jonkheer Ruys de Beerenbrouck. The elections of 1922 for the second chamber returned 32 Catholics, 20 Social Democrats, 16 Antirevolutionists, and some others, so that the Beerenbrouck ministry continued in power by the support of the Right bloc.

After the War the country was plunged more deeply into the stormy sea of foreign relations. On Nov. 10, 1918, the Dutch were unpleasantly surprised by the presence of the former Kaiser in their midst. His stay at Amerongen was unmolested, and in spite of demands from the Allies for his extradition in 1920, the Dutch government refused to yield him up. All other questions yielded precedence to the demand of Belgium for the revision of the treaties of 1839. Belgium, in effect, desired sovereignty over the western Scheldt as well as the district of southern Limburg on the east. Belgium sought the left bank of the Scheldt for the further development of Antwerp; Limburg (q.v.) was desired for strategic and economic reasons. For the consideration of the question the Supreme Council in 1919 created an international commission, but it circumscribed that body's activities by indicating that it would refuse to countenance any transfer of territory. The disputants were advised to come to an amicable understanding over the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine canal and two other water systems. Further difficulties arose, however, with Belgium's insistence that the disposition of the Weilingen at the entrance to the Scheldt, for the pass controlled the port of Zeebrugge, be also considered. On this no

agreement could be reached. There were other international concerns to occupy the attention of the Dutch in this period. In 1920, Holland joined the League of Nations. On Dec. 23, 1920, after heated debate, the Parliament voted to resume relations with the Vatican. These had terminated in 1907. In the same year, although it formally refused to open commercial relations with Russia, the Foreign Office indicated that it would not interfere with business transactions. In 1922, Holland welcomed to The Hague the Permanent Court of International Justice which had been created by the League of Nations. The question of the defense of the Dutch East Indies agitated the people profoundly during 1920-23. In 1921, the Queen's address from the throne included a request for the strengthening of the fleet, and the proposal was backed up by the resolution of the Indian Council. In 1922 the government laid before the second chamber an ambitious programme of naval construction. (See NAVIES OF THE WORLD.) The measure was stubbornly contested in 1922 and 1923. Its opponents showed that it meant an additional cost to Holland of \$14,000,000 yearly for 12 years, and to the colonies of \$20,800,000 for the same term. Nevertheless it was only after a bitter struggle that profoundly shook the whole kingdom that the naval bill was rejected, Oct. 26, 1923, by a vote of 50 to 49. The Ruys de Beerenbrouck cabinet now resigned. The inability of the three parties of the Right to reach an agreement compelled the Queen, after a three-month suspension of governmental activities, to recall de Beerenbrouck in January, 1924.

**NETHERLANDS INDIA.** See DUTCH EAST INDIES.

**NEUTRODYNE.** See RADIO TELEPHONY.

**NEVADA.** Nevada is the sixth State in size (110,690 square miles), and the forty-eighth in population; capital, Carson City. The population decreased from 81,875 in 1910 to 77,407 in 1920, a loss of 5.5 per cent. The white population fell off from 74,276 to 70,699; Indian, from 5240 to 4907; negro, from 513 to 346; native white, from 56,277 to 55,897; foreign-born white, from 17,999 to 14,802. The urban population of the State rose from 13,367 to 15,254, while the rural population decreased from 68,508 to 62,153. The only important city in the State is Reno, with 10,867 inhabitants in 1910, and 12,016 in 1920.

**Agriculture.** Nevada is, agriculturally, one of the least important States, although its agriculture is second only to its mining, and no other industry approaches it. The population of the State decreased 5.5 per cent in the decade 1910-20, but the number of farms increased 17.6 per cent (from 2689 to 3163). The acreage in farms decreased from 2,714,757 to 2,357,163 in 1920, or 13.2 per cent; and the improved land in farms, from 752,117 to 594,741 acres. The percentage of land used for agricultural purposes was 3.9 in 1910 and 3.4 in 1920. The total value of farm property showed an apparent increase from \$60,399,365 to \$99,779,666, or 65.2 per cent; the average value per farm, from \$22,462 to \$31,546, or 40.4 per cent. In interpreting these values and indeed all com-

parative values in the decade 1914-24, the inflation of currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 3163 farms in 1920, 2699 were operated by owners, 168 by managers, and 296 by tenants. The comparative figures for 1910 were 2175, 181, and 333. White farmers in 1920 numbered 2944, compared with 2528 in 1910. In 1920, native white farmers numbered 2060, compared with 1661 in 1910; foreign-born white farmers, 884, compared with 867. Colored farmers in 1920 numbered 219, of whom 208 were Indians; in 1910, 161, of whom 148 were Indians. Farms free from mortgage in 1920 numbered 1599, compared with 1805 in 1910; those under mortgage, 884, compared with 361. The number of dairy cows decreased from 17,084 to 16,482; "beef cows," from 210,546 to 189,960; sheep increased from 824,875 to 880,580. The area under irrigation in 1919 was 561,447 acres; in 1909, 701,833. The estimated production of the chief farm crops in 1923 was as follows: corn, 31,000 bushels; wheat, 507,000; oats, 122,000; barley, 226,000; potatoes, 698,000; and hay, 473,000 tons. Comparative figures for 1913 are: corn, 34,000 bushels; wheat, 1,081,000; oats, 473,000; barley, 492,000; potatoes, 1,760,000; and hay, 646,000 tons.

**Mining.** The most important mineral products of the State are silver, gold, gypsum, and copper. Silver, which is the most important mineral, showed a considerable decline in the decade 1914-24; in 1914 the production was 15,455,491 fine ounces; 1915, 14,459,840; 1916, 13,837,525; 1917, 11,269,969; 1918, 10,000,599; 1919, 6,863,580; 1920, 7,745,093; 1921, 7,083,782; and 1922, 8,619,587. The value of the gold produced also decreased sharply in the decade; the output in 1914 was valued at \$11,481,188; 1916, \$8,866,237; 1918, \$6,619,937; 1920, \$3,566,728; and 1922, \$3,297,384. Copper showed an increase in the middle of the decade but declined sharply in the later years; the production in 1914 was 60,986,450 pounds; 1916, 105,116,813; 1918, 116,316,441; 1920, 50,559,763; 1921, 10,961,491, and 1922, 23,133,091. The small output in 1921 was due chiefly to the business depression, which caused a decrease in the demand for copper. The production of gypsum during the decade ranged from 100,000 to 175,000 short tons per year, with a value in excess of \$1,000,000. In addition to the minerals mentioned, the State also produces lead, manganese ore, and zinc, but in comparatively small quantities. The total value of the mineral products in 1921 was \$14,038,071; \$25,648,961 in 1920; \$24,457,735 in 1919; \$51,080,169 in 1918, and \$29,984,338 in 1914.

**Manufactures.** See UNITED STATES, *Manufactures*.

**Education.** The educational problem of Nevada is made difficult by the State's sparse population and its vast area. In spite of these difficulties, the progress of education in the decade 1914-24 was constant. Efforts were made toward the consolidation of schools and the development of vocational education. The Legislature passed many measures which greatly aided the administration of the educational system. Vocational education is administered by the Director of Vocational Education and Industrial Rehabilitation, who is also super-

visor of trade and industrial education. The object in vocational education has been to reach, through a coöperative spirit, as large a number as possible of persons who may be benefited by the various types of instruction offered, in order that the productive industries of the State may be encouraged and the intelligence of those employed in the trades and other industrial pursuits may be increased; and efforts toward these objects have been successful. The cost of education in the State from 1912 to 1920 increased greatly; in 1912 the cost per pupil was \$76.38; in 1920, \$128.22; allowance is to be made, of course, for the decreased purchasing power of money. A high-school system was developed efficiently. The total enrollment in the schools in 1913 was 13,622; in the elementary schools in 1922 it was 11,518, and in the high schools, 2389. The total maintenance cost in 1922 was \$1,381,752; in addition to this there was a permanent investment of more than \$400,000 in grounds and buildings, making a total expenditure for elementary and high schools of \$1,784,831, or \$122.74 per census child in the State. Illiteracy in the State decreased from 6.8 per cent in 1910 to 6.7 per cent in 1920. Among the native white population it increased from 0.3 to 0.5 per cent; among the foreign-born white, from 7 to 8.5; among the negro, it decreased from 6 to 4.7.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** In the decade 1914-24, political control in Nevada fluctuated between the Democratic and Republican parties. In 1914 elections were held for governor, Senator, and Representatives to Congress. The Democratic candidate for governor, Emmet D. Boyle, was elected, defeating Gov. Tasker L. Oddie. Senator Newlands was reelected, while the Republicans elected a Representative to Congress. At this election an amendment providing for woman suffrage was adopted. In 1916 the Democrats had the predominance of strength and elected Key Pittman United States Senator. In the presidential voting of this year, President Wilson received 17,776 votes; Charles E. Hughes, 12,127. In this election, for the first time in the history of the State, women cast votes for President. The Democrats were again successful in 1918, reelecting Governor Boyle. Senator Newlands died in 1918, and Charles B. Henderson was appointed to fill the office until the election of his successor. The Republicans returned to power in 1920, electing T. L. Oddie, former governor, United States Senator. A woman, Anne Martin, was the Senatorial candidate on an independent ticket, the first woman candidate for this office. In the presidential voting of this year, Warren G. Harding received 15,479 votes; James M. Cox, 9851. In the elections of 1922, there was a political reaction, and the Democrats elected every State official except one. James W. Scrugham, the Democratic candidate for governor, was elected, and Senator Pittman was reelected to the Senate. The Supreme Court in 1923 declared unconstitutional the prohibition act passed by the Legislature in that year. On July 6, 1923, a fire at Goldfield resulted in the death of one person and a property loss of more than \$500,000. At a State Republican convention in May, 1924, the nine delegates of the State were pledged to vote for President Coolidge at the national convention.

**Legislation.** The most important acts of

the Legislature in the decade 1914-24 are noted below. The Legislature, in February, 1915, passed a so-called "easy divorce bill," restoring the six months' residence requirement which had been abolished by the Legislature of 1913. The Legislature of 1919 provided for a budget and passed measures providing for an eight-hour day on public works. It also passed statutes defining and punishing criminal syndicalism and sabotage. In 1921 the Legislature created town-planning commissions for incorporated cities and towns, declared oil pipe lines to be common carriers, and made provision for the teaching of thrift in the public schools. A bill for capital punishment by lethal gas instead of by hanging or shooting was signed by Governor Boyle on Mar. 28, 1921, and on February 8, 1924, Gee Jon, a Chinese convicted of murder, was executed by this method. In 1923 the Legislature repealed the State prohibition law which had been declared unconstitutional and substituted a measure corresponding to the Volstead Act. It also granted equal rights in the guardianship of children to women, extended the absent voter privilege to persons who because of physical disability expect to be confined to their homes on Election Day, made the possession of drugs illegally obtained a crime, passed a uniform trading act, enacted a modified old age pension law, and created a small claims court.

**NEVADA, UNIVERSITY OF.** A coeducational State institution at Reno, Nev., founded in 1874. The student enrollment of the university increased from 340 in 1914 to 825 in the year 1923-24, with 134 in the summer session of 1923. During the decade the faculty likewise increased from 50 to 62 members. The library rose from 28,000 bound volumes in 1915 to 38,843 in 1923. An agricultural building was constructed in 1918, an educational building in 1920, and a building to house the Federal Bureau of Mines' Rare and Precious Metals Experiment Station in 1921. Walter E. Clark, Ph.D., LL.D., succeeded Archer Wilmot Hendrick as president in 1917.

**NEVIN, ARTHUR FINLEY** (1871- ). An American composer, born at Edgeworth, Pa. Having received his first musical education from his father, he entered the New England Conservatory in 1891, studying with O. Bendix (piano) and P. Goetschius (theory). From 1893 to 1897 he studied in Berlin with Klindworth, Jedliczka (piano), and Boise and Humpardinck (composition). He then returned to Edgeworth, where he lived until 1910, devoting his time to composition and teaching. In 1903-04 he spent some time with the Blackfeet Indians in Montana, collecting their melodies and legends. There he found the subject for his Indian opera *Poia*, which was produced at the Royal Opera in Berlin (1910), the first work of an American composer ever brought out at that institution. In 1915-20 he was professor of music at the University of Kansas, and in 1921 he became director of municipal music at Memphis, Tenn. He also wrote two other operas, *The Daughter of the Forest* (Chicago, 1918) and *Twilight* (not produced up to 1924); a masque, *A Night in Yaddo-Land*; two cantatas, *Roland* and *The Djinns*; three orchestral suites, *Miniature*, *Lorna Doone*, and *Love-Dreams*; *Bakawali Dances* for orchestra; a string quartet and a piano trio; and piano numbers and songs.

**NEVINSON, HENRY WOOD** (?- ). An English newspaper correspondent and writer. He was correspondent for the *Daily Chronicle* in the Greco-Turkish War of 1897, traveled much in Spain, Africa, and elsewhere in the years following, and reported for various newspapers campaigns in Morocco and the Balkans in 1912. He was accredited by the War Office as official correspondent at the Dardanelles for several papers and was wounded during operations there. He was later correspondent with the British armies in Salonica, Egypt, France, and Germany. He was editorial writer for several important papers and wrote much on politics and other subjects. His books include: *The Thirty Days' War* (1898); *Books and Personalities* (1905); *The Dawn in Russia* (1906); *The Dardanelles Campaign* (1918); *Lines of Life* (1920); *Essays in Freedom and Rebellion* (1921); and *Changes and Chances* (1924).

**NEW, HARRY STEWART** (1858- ). A Postmaster General of the United States, born at Indianapolis, Ind., and educated at Butler University. He began as a reporter on the *Indianapolis Journal*, and from 1878 to 1903 he was editor, part owner, and publisher of that newspaper. He served in the Spanish-American War. In 1896 he was elected to the Indiana State Senate for four years, and from 1900 to 1912 he was a member of the Republican National Committee. In 1917 he was elected to the United States Senate and served till 1923, when he was appointed Postmaster General by President Harding.

**NEWARK.** The largest city in the State of New Jersey. The population rose from 347,469 in 1910 to 414,524 in 1920 and to 438,699 by estimate of the Bureau of the Census for 1923. The 250th anniversary of the city was celebrated during five months of 1916 with an historical pageant, a prolonged music festival and an exhibit of local industries. A memorial building was erected by the city at a cost of \$1,500,000 to mark the occasion, and a copy of Verrocchio's equestrian statue of Bartolommeo Colleoni, executed by J. Massey, was given to the city by Christian Feigenspan. The city-planning commission in 1915 offered a comprehensive plan for the city of Newark, and a zoning plan in 1919. The northeast wing of the city hospital was built in 1915; a site for the Newark museum was bought in 1922 and \$500,000 given by Louis Bamberger towards the \$625,000 necessary for the building. A new two-story city market building covering two acres, with an open paved farmers' market of three acres, was finished in 1923 at a cost of \$5,100,000. Port development also proceeded rapidly, especially along the tidal meadows known as Port Newark. Between 1913 and 1924, the city spent \$6,000,000 reclaiming, filling and developing a large area of the meadows and constructing a channel 30 feet deep and 400 feet wide. During the War about half the Port was taken over in the interest of the Federal government, which built warehouses for use as army bases at a cost of upwards of \$13,000,000. The Submarine Boat Corporation, which received a subsidy from Congress of \$17,000,000, built 150 steel merchant vessels during the War from their shipyards on the reclaimed land; two other shipbuilding corporations were established in Kearny. Several streets were built in the district. Eventually, under the plan, 4000 acres of this part of the harbor were

to be filled in and improved, a number of water channels were to be dredged extending into all parts of the new land, piers were to be constructed at least 1200 feet long to accommodate ocean-going vessels, and equipped with adequate railroad tracks, electric traveling cranes, warehouses, etc. In 1922, the Central Railroad of New Jersey was authorized by the War Department to build a bridge across the lower end of Newark Bay to replace the trestle and draw-bridge then standing. This permission the city contested in the courts. Further appropriations of \$2,100,000 for the immediate improvement of Newark Bay and the Passaic and Hackensack Rivers was authorized by Congress in 1922; in 1924, the government had started additional widening of Newark Bay channel and expected to spend nearly \$800,000 in that year. Direct boat operation was established between Newark and Pensacola, Fla., Mobile, Ala., Beaumont and Port Arthur, Tex., Los Angeles and San Francisco, Cal., Portland, Ore., and Seattle, Wash. In 1923, new industrial establishments made investments in Newark of approximately \$70,000,000. The commission form of government was adopted by the city in 1917.

**NEWARK MUSIC FESTIVAL.** See MUSIC, *Festivals*.

**NEW BEDFORD.** The fourth city in Massachusetts in population and third in value of its manufactured products. The population increased from 96,652 in 1910 to 121,217 in 1920, nearly 40 per cent in 10 years, and to 130,072 by estimate of the Bureau of the Census for 1923. During the decade 1914-24 a State pier 750 feet long was completed. A modern intercepting sewer system was installed, adequate to care for a population of 300,000. The capital invested in the cotton mills, the leading industry, rose from \$47,820,575 in 1914 to more than \$175,000,000 in 1924, and the number of persons employed from 31,820 to 36,000. The public library was increased from 150,000 to 160,000 volumes.

**NEWBERRY, TRUMAN HANDY** (1864- ). An American financier and public official, born in Detroit, Mich. He graduated from Yale in 1885 and was later connected in various capacities with railroads and other industrial organizations. In the Spanish-American War he served as lieutenant and navigator. He was appointed Assistant Secretary of the Navy in 1905 and served until 1908, when he assumed the post of Secretary of the Navy until March, 1909. In the War he was commander of the United States Naval Reserves. He was a candidate for the United States Senate in 1918 and in the primaries defeated Henry Ford for the nomination. He was later elected. The expenditure of over \$200,000 in the primaries led to accusations of corruption. He was tried and convicted in the State courts, but the case was dismissed in the United States Supreme Court. Charges were brought before the Senate Committee on Privileges and Elections in 1922, and he was exonerated. He resigned his seat following the elections of 1922. See MICHIGAN.

**NEW BRUNSWICK.** A Canadian maritime province, with an area of 27,985 square miles. In 1911 the population was 351,889; in 1921, 387,876, a gain of 10.23 per cent. The rural population in 1921 was 67.9 per cent of the total; in 1911 it had been 71.7 per cent. Populations of the principal towns in 1921 were:

St. John, 47,166 (42,511 in 1911); Moncton, 17,488; Fredericton, the capital, 8114.

**Industry and Trade.** In 1923 only 909,945 acres were under field crops out of the total area, although agriculture was the most important industry. The increase over 1914 was only slight (904,055 acres in 1914). Total value of yield in 1923, \$20,864,300; in 1914, \$20,045,100. Oats, hay and clover, and potatoes received the greatest attention. Dairying showed substantial gains, since 1,224,930 pounds of butter were made in 1922, against the 849,633 pounds in 1910. Fishing continued to occupy a high station; in 1922 the catch was valued at \$4,688,276, comparing favorably with that of 1913. Mineral production in 1922, largely made up of coal and gypsum, reached \$2,263,692, as compared with \$1,102,613 in 1913. Much of the forest land was in the hands of the government, and lumbering ranked high among the industries. Lumber cut in 1921 was valued at \$7,811,000; pulpwood made a very thriving industry (61,810 tons), worth about \$5,244,000. Manufacturing progressed. In 1910 there were 1158 establishments (capital \$36,125,012); in 1921, 1326 establishments (capital, \$103,367,891). The output in 1910 was \$35,422,302; in 1921, \$59,514,741. Of the 50,406 horse power estimated available, 47,100 (1923) were already being worked. Exports, domestic and foreign, amounted to \$75,924,379 in 1922-23 (\$34,634,156 in 1912-13); imports in 1922-23, \$27,574,668 (\$14,445,811 in 1912-13). In 1922 there were 1947 miles of railway line as compared with 1545 in 1913.

**Government.** The receipts for 1922 were \$3,226,728 (\$1,459,000 in 1913), and expenditures \$2,985,877 (\$1,446,963 in 1913). The debt of the province in 1912 was only \$4,693,457; by March, 1922, it had mounted to \$25,463,932. The money expended on public works, i.e. hydro-electric development, roads, bridges, and grants to railways, accounted for the increase. By 1922 teachers had increased to 2246 from the 2002 in 1913, and pupils to 71,346 from the 63,580 in 1913. The total cost of education also increased, from \$942,203 in 1913 to \$2,657,046 in 1922. Of the three universities in the province, Mt. Allison, the largest, was in favor of a federation of the universities of all Maritime Provinces, but the University of New Brunswick stood in the way. The province was represented in the Canadian Parliament by 10 senators and 11 members of the house. The suffrage was exercised by both sexes.

**NEW CALEDONIA.** See PACIFIC OCEAN ISLANDS.

**NEWELL, EDWARD THEODORE** (1886- ). An American numismatist, born at Kenosha, Wis., and educated at Yale University. From 1907 he was engaged in research in numismatics and kindred subjects. He was a member of numismatic and learned societies and wrote many works on coins and minting, including *The Dated Alexander Coinage of Sidon and Ake* (1916); *Tarsos under Alexander* (1919); *Myriandros* (1920); and *The Kyparissia Hoard* (1921). In 1917-18 he served with the military intelligence division of the United States Army.

**NEWFOUNDLAND.** A British dominion in North America, comprising the island of Newfoundland and Labrador (q.v.). The area of the island is 42,734 square miles; of Labrador,

120,000. The total population increased from 242,619 in 1911 (Labrador, 3949) to 262,979 in 1921 (Labrador, 3621). St. John's, the capital, had a population of 37,047 in 1921 (32,292 in 1911); Harbor Grace, 3825 (4279); Bonavista, 4025 (3911); Carbonear, 3320 (3540). The population, the great bulk of which was native and of English, Irish, and Scotch descent, still remained practically concentrated on the southeast coast. Emigration rose noticeably during the postwar depression.

**Industry and Trade.** Fishing continued to exceed all other occupations in importance. During the War it enjoyed exceptional prosperity in consequence of the general food shortage but afterward suffered an equally marked decline. For the falling-off in the cod fishery, a two-season attempt at government control of sales was held partly responsible. In 1922-23, 939 men and 51 vessels on the Banks brought in a catch of 69,372 quintals, compared with 152,374 quintals brought in by 1830 men in 104 vessels in 1913. The serious decline in the seal fishery was partly attributable to the loss of ships and the prohibitive cost of shipbuilding. In 1913, 19 steamers with 3609 men brought in 272,065 seals; in 1922-23 it required a government subsidy and removal of all restrictions to induce 8 vessels with 1224 men to carry on the work, and only 101,770 seals were taken in that year. The lobster, herring, and whale fisheries also showed a distinctly downward trend; the lobster had grown scarce because of overfishing; the herring market was affected by renewed European competition; the whale fisheries had practically ceased. The prime reason for this serious slump, however, was the depreciation of currencies in the Mediterranean countries which had grown to be the chief markets for the catch. At prevailing rates of exchange, that trade had ceased to be profitable. To relieve the serious situation that ensued, the government in 1923 undertook a programme of encouragement for industry and farming, in order to relieve the almost entire economic dependence of the island on its fisheries. Plans were under way in that year to develop the water-power resources at Grand Lake on the west coast, at a cost of \$18,000,000, part of which was to be advanced by the British government. This project was expected to supply power for a large pulp and paper mill, to hasten the development of mineral resources, and possibly to lead to the smelting of iron. Incidentally the preliminary work was reducing unemployment. The industries growing out of the great forest resources had already extended considerably. Spruce had replaced the disappearing pine as the important wood. Pulp and paper mills in 1920 exported 19,864 tons of pulp (\$334,276) and 80,719 tons of paper (\$4,725,660). The mineral production, chiefly iron, in 1912 amounted to \$2,810,000; in 1920-21, 607,982 tons of iron, valued at \$672,061, were exported. Some copper and oil had been produced. The mineral resources were as yet unexplored, although in 1921 a beginning was made at the development of certain coal deposits and the investigation of oil-bearing lands. Of the 4,000,000 acres capable of cultivation, up to 1923 only 220,000 were being utilized, and the government was actively encouraging the population away from the sea to the land. The chief crops were hay, potatoes, cabbage, turnips, and

oats. The total value of farm crops in 1912 was \$2,000,000; in 1921, \$14,367,877. Exports, which in 1913-14 were valued at \$14,720,000, had risen by 1918-19 to \$36,784,616 but fell sharply in two years to \$19,478,417 in 1921-22 (\$20,956,863 in 1922-23). Imports fluctuated likewise: \$14,793,000 in 1913-14; \$40,533,388 in 1919-20; \$18,309,853 in 1921-22; \$19,321,824 in 1922-23. The export trade with Canada gained considerably in importance in 1922-23, but the chief markets were still the United Kingdom, Portugal, Spain, and the United States. The bulk of the imports came from Canada and the United States, the former achieving first place as a source during this period. Dry codfish remained the principal export, with manufactured paper in second place. Other important items in 1922-23 were iron ores, cod oil, herring, pulp and sulphide, lobsters, sealskins, and seal oil. The total value of fishery exports in that year was \$12,374,169 (\$14,448,736 in 1921-22). The total revenue of the dominion, in bulk from customs, was \$3,142,491, and the expenditure \$3,524,653, in 1911-12. From 1917 to 1921, there was a decided surplus in the treasury in spite of extraordinarily generous appropriations. In 1921-22, however, the revenue had shrunk to \$8,269,680, with an expenditure of \$9,127,542, but from that year the situation began to mend. The increase of the funded public debt from \$29,470,060 in 1912-13 to \$55,030,027 in 1921-22 was largely due to war expenditure (\$60 per capita). In 1922-23, the revenue was \$8,876,772; expenditure, \$9,552,301; funded debt, \$54,957,765. In 1919 there were 904 miles of government railroad, as compared with 794 in 1913. Additional proposed extensions had been postponed during the War, after which, because of unprofitable operation, the management of the roads and their extension became a conspicuous problem of the government. There was an additional 47 miles of private line. The mileage of telegraph wires (open) increased from 4225 in 1914 to 4600 in 1922; telephone wires, from 899 in 1913 to 965 in 1922. Steamship communications with the United Kingdom, Canada, and the United States were disorganized during the War, but were being steadily restored. Public instruction still remained under denominational auspices, with government support, and school attendance had not been made compulsory by law.

**History.** A Newfoundland regiment was enlisted on the outbreak of the War, and saw service in Gallipoli, Egypt, France, and Flanders. In all, some 6500 men were under arms. In 1913, Sir Edward Morris's party was returned to office and continued in power through 1917, when the Morris government was succeeded by a ministry headed by Sir William Lloyd. In 1919, Sir Michael Cashin became premier; in November, 1919, as a result of the general election, Mr. Richard Squires succeeded to office. The Squires government, however, resigned in 1923, though the general election of May had returned it with a sizable majority. Mr. W. R. Warren was then summoned by the governor. On Dec. 26, 1923, Premier Warren brought a grave accusation against his predecessor, Sir Richard A. Squires, charging him, among other things, with the receipt of money from private corporations and diversion of government funds to individuals occupying high official posts. An investigator for the British Colonial Office found the

charges in a large measure true; this was followed by the arrest of Squires in April and the overthrow of the Warren government. Reorganization of the public services and a greater honesty in government became the leading issues of the day. Mr. Hickman, who succeeded Mr. Warren, enjoyed only a brief tenure of office, for his party was turned out in the general election of June 3. He was in turn followed by Mr. Walter Warren who proceeded to investigate his predecessor's government.

**NEW GUINEA.** One of the largest islands of the world, in the East India Archipelago. Area, 320,000 square miles (estimated). Politically it was divided into: (1) Dutch New Guinea, area, 160,692 square miles; population (1920) 195,460; (2) Territory of Papua (British New Guinea), area, 90,540 square miles; population 276,888 (1922); (3) Territory of New Guinea (late Kaiser Wilhelm's Land), area, 70,000 square miles; population (estimated), 100,000. This was for the mainland only.

Dutch New Guinea was administered from the Dutch East Indies (q.v.), of which, for trade and other purposes, it was considered an integral part.

The Territory of Papua was a possession of the Australian Commonwealth. Little of the area was under cultivation; the natives are averse to hard labor. In all, only 219,181 acres had been leased by planters (1922), and coconuts, rubber, and sisal hemp were the chief products. Gold continued to be mined to some extent, and boring for oil began after 1915. The gold output declined from £64,115 in 1912-13 to £60,091 in 1921-22. Imports and exports for 1913-14 were £212,134 and £123,140; for 1921, £484,770 and £172,672. Revenues and expenditures for 1913-14 were £54,703 and £81,095; in 1921-22, £73,288 and £124,912. To meet the deficit, Australia supplied an annual grant of £50,000. The Australian government showed itself zealous in the preservation of the integrity of the natives and refused to settle cheap coolie labor in the territory. In 1922 Europeans numbered 1104. Port Moresby was the chief town and port of call for Australian ships.

The Territory of New Guinea was the name given to the former German New Guinea and included besides the late Kaiser Wilhelm's Land (area 70,000 square miles; population, 100,000), the Bismarck Archipelago (area 17,600 square miles; population, 188,000), made up of New Britain, New Ireland, and other islands, and Bougainville and Buka of the Solomon Islands group (area 3400 square miles; population, 17,000). On Sept. 12, 1914, an Australian force occupied the islands. A mandate was given to Australia for the territory by the League of Nations on Dec. 17, 1920; the Australian government established its civil administration on May 9, 1921. The seat of government was at Rabaul on New Britain, the former German capital. In 1921, nonindigenous inhabitants numbered 3173, divided as follows: 715 British, 1402 Chinese, 215 Dutch, 579 Germans, 87 Japanese, and 60 Americans. On the mainland coconuts were cultivated as well as rubber and cocoa; tropical fruits served as the articles of food. Total revenues for 1918-19 and 1921-22 were £55,760 and £91,644. Exports for the same years were £269,666 and £499,197; imports, £271,861 and £468,711.

Leading exports were copra, shell, cocoa, and birds of paradise. Imports included groceries, hardware, tobacco, spirits, and oils. See also ETHNOGRAPHY.

**NEW HAMPSHIRE.** New Hampshire is the forty-third State in size (9341 square miles), and the forty-first in population; capital, Concord. The population increased from 430,572 in 1910 to 443,083 in 1920, a gain of 2.9 per cent. The white population increased from 429,906 to 442,331; negro, from 564 to 621; native white, from 333,348 to 351,098. The number of foreign-born white fell from 96,558 to 91,233. The urban population of the State mounted from 255,099 to 279,761, while the rural decreased from 175,473 to 163,322. There are only two important cities, Manchester and Nashua. The former increased from 70,063 in 1910 to 78,384 in 1920; the latter from 26,005 to 28,379.

**Agriculture.** While the population of the State increased 2.9 per cent in the decade 1910-20, the number of farms decreased 24.1 per cent (from 27,053 to 20,523); the land area in farms, from 3,249,458 acres to 2,603,806, or 19.9 per cent; the improved land in farms, from 929,185 acres to 702,902. The total percentage of land used for agricultural purposes decreased from 56.2 in 1910 to 45 in 1920; the percentage of improved farm land, from 28.6 to 27. The total value of farm property showed an apparent increase from \$103,704,196 to \$118,656,115, or 14.4 per cent; the average value per farm, from \$3833 to \$5782, or 50.8 per cent. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 20,523 farms in 1920, 18,604 were operated by owners, 546 by managers, and 1373 by tenants. The comparative figures for 1910 were 24,493, 681, and 1879. White farmers numbered, in 1920, 20,509, of whom 17,890 were native and 2619 foreign-born. In 1910 the white farmers numbered 27,038 (native-born, 24,347; foreign-born, 2691). Farms free from mortgage in 1920 numbered 11,992, compared with 18,119 in 1910; those under mortgage numbered 5389, compared with 6234. The number of dairy cows increased from 101,278 in 1910 to 119,203 in 1920, indicating a decided trend toward the dairy industry. "Beef cows," however, decreased from 16,175 to 5055, and sheep decreased from 31,201 to 28,021. The estimated production of the principal farm crops in 1923 was as follows: corn, 978,000 bushels; oats, 598,000; potatoes, 1,735,000; hay, 494,000 tons; and apples, 191,000 bushels. Comparative figures for 1913 are: corn, 814,000 bushels; oats, 420,000; potatoes, 2,074,000; hay, 495,000 tons.

**Manufactures.** New Hampshire is an import industrial State in point of value of products. There were, in 1920, 8 cities of 10,000 inhabitants or more, the combined population of which formed 43.7 per cent of the total for the State; in 1919 they reported 63.3 per cent of the value of the State's manufactured products. There were in the State, in 1909, 1961 manufacturing establishments; in 1914, 1736, and in 1919, 1499. Persons engaged in manufacture numbered 84,191, 85,013, and 90,332; while the capital invested amounted to

\$139,989,662, \$156,748,853, and \$329,166,870 in those years. The value of the products, in 1909, was \$164,581,019; in 1914, \$182,843,863; and in 1919, \$407,204,934. The increase in value of products from 1914 to 1919 was in great measure due to changes in industrial conditions brought about by the War. The first industry in point of value of products is the manufacture of boots and shoes, amounting to \$39,440,000 in 1909; \$46,695,000 in 1914, and \$92,259,000 in 1919. The second in this respect is the manufacture of cotton goods, which had a value of \$33,602,000 in 1909; \$35,793,000 in 1914; and \$86,392,000 in 1919. Manufactures of woolen and worsted goods, in third place, were valued, in 1909, at \$16,731,000; 1914, \$15,039,000; and 1919, \$45,944,000. The paper and wood pulp industry, next in order, had an output valued at \$13,994,000 in 1919; \$17,708,000 in 1914; and \$41,826,000 in 1919. The most important manufacturing cities are Manchester and Nashua. In Manchester there were, in 1909, 175 manufacturing establishments, with a product valued at \$46,812,000; 1914, 151 with \$50,800,000; 1919, 165 with \$117,493,000. Nashua had, in 1909, 104 manufacturing establishments, with a product valued at \$17,326,000; in 1914, 87 with \$22,780,000; and in 1919, 92 with \$48,985,000. Other important manufacturing cities are Concord, Dover, Keene, Berlin, Laconia, and Portsmouth.

**Education.** The development of its educational system has always been one of the chief concerns of the people of New Hampshire. As in the case of the other New England States, the decrease in rural population has proved a difficult problem. In 1919 large sections of New Hampshire had become so impoverished and so depopulated that under the existing school laws reasonable elementary education could not possibly be provided for a very large number of children. Because of this, the Legislature, after a careful study, reorganized the school system and for the first time in the history of the State wrote the school laws into a consistent code, in 1921. The results of this action were immediate. The principles of Americanization, equalization, and supervision were adopted. More specifically, the Board of Education was reorganized, methods of consolidation were provided, and, especially, provision was made for education in sparsely populated districts. The Legislature of 1923 passed several important measures which amplified and revised measures already enacted. For one, the provisions of the Smith-Hughes Act of 1917 for the promotion of vocational education were accepted, and the State Board of Education was authorized to arrange with institutions, and with the school boards of towns or city districts in the State, to furnish the necessary buildings and equipment for carrying out the provisions of the Federal Act. In 1914 the enrollment in the public schools was 63,004; in 1922, 75,683. In the latter year, in the elementary schools, 58,475 were enrolled; in the kindergartens, 1825; and in the high schools, 10,322. The total expenditure for public education in 1923 was \$5,718,609. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 5.4 in 1920; among the native white population, from 0.9 to 0.6; among the negro, from 13.8 to 7.7. In the foreign-born population it increased from 15.4 to 16.4.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** In the decade 1914-24, New Hampshire remained consistently Republican, with the exception of one year, when the Democrats succeeded in electing their candidate for governor. In 1914 elections were held for governor, United States Senator, and Representative in Congress. Rollin H. Spalding was reelected Governor, and J. H. Gallinger was reelected to the Senate. The Republicans elected two Representatives to Congress. In the elections of 1916 the Republicans elected their candidate for governor, Henry W. Keyes, and carried other State offices, although at a reduced margin. In the presidential voting of this year, President Wilson obtained 43,871 votes; Charles E. Hughes, 43,725. At this election the people voted to call a constitutional convention. In January, 1916, the United States government purchased, under the Weeks Forestry Land Act, a tract of 55,000 acres to be added to the forest reserves of the State. Senator Gallinger died during the primary election campaign of 1918, and the term of Henry F. Hollis, Democrat, expired in 1918. It was thus necessary to elect two Senators in this year. Gov. Henry W. Keyes was elected for the regular term, and George H. Moses was chosen successor to Senator Gallinger. In the State election, John H. Bartlett, Republican, was elected governor, together with a Republican Legislature. The constitutional convention met in June, 1918, but adjourned following its organization. It met twice subsequently, but none of the amendments it submitted to the people was ratified. Elections were held in 1920 for United States Senator and for governor and other State officers. The Republicans elected their candidate for governor, Albert O. Brown, and reelected Senator Moses to the Senate. In the presidential election of this year, W. G. Harding received 94,947 votes; James M. Cox, 62,562. In 1922 the Democrats succeeded to power in the State and elected their candidate for governor, Fred H. Brown, and a Representative to Congress. They also elected a majority of 10 in the Legislature, although the Republicans continued to control the Senate. F. H. Brown was inaugurated in January, 1923. In his inaugural message he favored a law establishing a 48-hour week for women and children in the manufacturing industries; an amendment of the tax laws, and a tax of \$.01 a gallon on gasoline.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1917 amended the laws relating to the conduct of trials and made provision for the calling of a constitutional convention in June, 1918. The governor was given authority to suspend the labor laws by the request of the Council of National Defense. A "blue sky" law was enacted, and the laws relating to banking and education were amended. The Legislature of 1919 ratified the Federal prohibition amendment on January 16 of that year and the woman suffrage amendment on September 9. The Legislature of 1921 regulated the practice of chiropractors; provided further safeguards against forest fires; made provisions for the protection of maternity and infancy; and regulated and limited the investments of savings banks. In 1923 the Legislature made provision for another constitutional convention; passed a uniform sales act, lev-

ied a gasoline tax, and laid a tax on income from intangibles.

**NEW HAMPSHIRE.** UNIVERSITY OF. A coeducational State institution at Durham, N. H., founded as the New Hampshire College of Agriculture and the Mechanic Arts in 1866 and incorporated as the University of New Hampshire, July 1, 1923. The university more than tripled in size during the decade between 1913-14 and 1923-24, with 300 students enrolled and 46 members of the faculty in the former year as compared with 1123 students and 99 members of the faculty in the latter. The library was increased from 35,000 to 47,800 volumes. Two men's dormitories, a women's dormitory, and a commons building were added to the physical plant. Ralph Dorn Hetzel, A.B., LL.B., LL.D., succeeded Edward Thomson Fairchild, A.M., LL.D., as president in 1917.

**NEW HAVEN.** The largest city of Connecticut and the fourth largest city of New England; a manufacturing and educational centre. The population rose from 133,605 in 1910 to 162,537 in 1920 and to 172,967 by estimate of the Bureau of the Census for 1923. A new railroad station was built, as well as a number of new buildings at Yale University, and a commercial high school and two junior high schools; and there was a wide extension of manufacturing and office facilities. More than 500 acres were added to the city park system, including shore frontage for a municipal bath beach.

**NEW HEBRIDES.** See PACIFIC OCEAN ISLANDS.

**NEW JERSEY.** New Jersey is the forty-fifth State in size (8224 square miles), and the tenth in population; capital, Trenton. The population increased from 2,537,167 in 1910 to 3,155,900 in 1920, a gain of 24.4 per cent. The white population increased from 2,445,894 to 3,037,087; Negro, from 89,760 to 117,132; native white, from 1,787,706 to 2,298,474; and foreign-born white, from 658,188 to 738,613. Both urban and rural populations increased during the decade; the former from 1,907,210 to 2,474,936; the latter, from 629,957 to 680,964. The growth of the principal cities was as follows: Newark (q.v.), 347,469 (1910), to 414,524 (1920); Jersey City (q.v.), 267,779 to 298,103; Paterson (q.v.), 125,600 to 135,875; Trenton (q.v.), 96,815 to 119,289; Camden (q.v.), 94,538 to 116,309.

**Agriculture.** In common with most of the eastern States, the development of agriculture in the decade 1910-20 did not keep pace with the growth in population. This is shown by the fact that while the population increased during the decade 24.4 per cent, the number of farms decreased 11.3 per cent (from 33,487 in 1910 to 29,702 in 1920); the rural population decreased from 29.4 per cent in 1900 to 24.8 per cent in 1910 and 21.3 per cent in 1920. The acreage of land in farms decreased 11.3 per cent, or from 2,573,857 acres to 2,282,585; while the improved land in farms showed an even greater decrease, from 1,803,336 to 1,555,607 acres, or 13.7 per cent. The percentage of the total land area in farms decreased from 53.5 per cent in 1910 to 47.5 per cent in 1920, while the percentage of improved land in farms decreased from 37.5 to 32.3. The total value of farm property in the State showed an apparent increase of 22.4 per cent, or from

\$254,832,665 to \$311,847,948; the average value per farm, from \$7610 to \$10,499. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 29,702 farms in 1920, 21,889 were operated by owners, 987 by managers and 6826 by tenants. The corresponding figures for 1910 were 24,133, 1060 and 8294. White farmers in 1920 numbered 29,167 and colored farmers, 535. In 1910, the white farmers numbered 33,011 and colored farmers, 476. Farms free from mortgage in 1920 were 10,000; those under mortgage, 10,085. In 1910, the unmortgaged farms numbered 11,983; those under mortgage, 11,793. The total number of cattle in 1920 was 179,459; in 1910, 222,999. Dairy cattle numbered 172,693 and 154,418, in those years. Sheep in 1920 numbered 10,471, compared with 30,683 in 1910; hogs, 139,222 as compared with 147,005. The estimated production of the chief farm products in 1923 was as follows: corn, 9,416,000 bushels; wheat, 1,480,000 bushels; oats, 1,588,000 bushels; rye, 1,157,000 bushels; potatoes, 6,360,000 bushels; sweet potatoes, 2,323,000 bushels; hay, 313,000 tons; and peaches, 2,380,000 bushels. Comparative figures for 1913 are: corn, 10,862,000 bushels; wheat, 1,408,000; oats, 2,030,000; rye, 1,260,000; potatoes, 8,930,000; and hay, 469,000 tons.

**Mining.** New Jersey is one of the most important mineral-producing States in the eastern part of the country, and it is the only far eastern State that produces zinc. Although it has a considerable diversity of mineral products, the most important are clay products and zinc. The values of the clay products have been \$16,484,652 (1914); \$20,814,402 (1916); \$20,741,244 (1918); \$40,021,028 (1920); \$27,214,685 (1921). Zinc production was 74,253 short tons (1914); 112,020 short tons (1916); 98,470 (1918); 77,371 (1920); 56,447 (1921). Cement is also one of the most important mineral products; shipments were 3,530,476 barrels valued at \$3,081,205 (1914); 2,397,069 barrels, \$2,962,592 (1917); 2,563,453, \$5,096,558 (1920); 2,840,699, \$4,820,538 (1921). In addition to the minerals mentioned, the State produces a small quantity of iron ore and large quantities of sand, gravel and stone. The total value of the minerals in 1921 was \$47,429,290, compared with \$72,335,207 in 1920; \$56,898,033 in 1919; \$49,510,290 in 1918; and \$31,756,503 in 1914.

**Manufactures.** New Jersey is one of the leading industrial States. In 1920, there were 39 cities having a population of more than 10,000. These contained 65.6 per cent of the total population of the State, and in 1919 reported 76.4 per cent of the State's manufactured products. There were in the State 8817 manufacturing establishments in 1909; 9742 in 1914; and 11,057 in 1919. Persons engaged in manufacture numbered 371,265, 431,003, and 602,170; and the capital invested amounted to \$977,172,141, \$1,352,381,873, and \$2,815,577,127, in those years. The total value of the products was \$1,145,529,076 in 1909; \$1,406,633,414 in 1914; and \$3,672,064,987 in 1919. The large increase in value of products during 1914-19 was due largely to the change in in-

dustrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of wage earners and in number of establishments indicates clearly a decided growth in the manufacturing activities of the State. The most important industry in point of value of product is the refining of petroleum, valued in 1914 at \$90,877,000; and in 1919, at \$280,995,000. The smelting and refining of copper ranks second in this respect: in 1909, \$125,651,000; in 1914, \$159,199,000; and in 1919, \$244,269,000. Shipbuilding, in third place, had a product valued at \$8,841,000 in 1909; \$11,861,000 in 1914; and \$238,015,000 in 1919; the extraordinary increase from 1914 to 1919 being due to the conditions resulting from the War. The three-year period from 1916 to 1919 shows an abnormal increase in vessels and gross tonnage launched, which renders comparison of little value. Silk goods, next in order, were valued in 1909 at \$65,540,000; in 1914, \$75,706,000, and in 1919, \$215,051,000. The most important manufacturing cities are Newark, Jersey City, Paterson and Trenton. In Newark there were 1857 manufacturing establishments in 1909, with a product valued at \$201,888,000; 2275 in 1914, with \$210,601,000; and 2155 in 1919, with \$577,609,000. In Paterson, there were 702 in 1909, with \$69,263,000; 735 in 1914, with \$78,429,000; 1044 in 1919, with \$216,659,000. Jersey City had 745 manufacturing establishments in 1909, with a product valued at \$128,775,000; 770 in 1914, with \$164,529,000; 896 in 1919, with \$374,183,000. Similar figures for Trenton were 340 manufacturing establishments, with a product valued at \$49,115,000; 394 with \$54,822,000; 389 with \$122,478,000. Other important manufacturing cities are Camden, Bayonne, Hoboken and Passaic.

**Education.** In the decade 1914-24, important progress was made in educational matters in New Jersey. Much important legislation was passed, especially in the latter part of the period. In 1919, there was established by law a new teachers' pension annuity system to supersede the old teachers' retirement fund. The new system operates on an actuarial basis; contributions from salaries of teachers are matched by the State, and this provides a pension of approximately half pay. A compulsory physical education law also was passed in 1919; and a continuation school law, requiring children from 14 to 16 years of age to attend continuation classes six hours a week after working papers have been obtained. In 1922, provision was made for special aid by the State to school districts not able of themselves to provide satisfactory schools. The complete survey of finances and business procedure of school districts made in 1921-22 resulted in improved methods in the handling of public moneys. A new normal school was opened at Glasborough in 1923, and in the same year plans were started for a new normal school in Jersey City. Between 1913 and 1923, the enrollment in the public schools increased from 501,948 to 646,046, and the number of teachers increased from 14,811 to 18,273. In the same period the cost of education more than doubled, the cost per pupil, based on average daily attendance, being \$91.77 in 1923 as contrasted with \$43.72 in 1913. The chief item in this greatly increased cost was the much higher salaries for teachers.

The percentage of illiteracy in the State decreased from 6.7 in 1910 to 6.6 in 1920: among the native white population, from 1.4 to 0.9 per cent; among the Negro, from 11.9 to 7.5. The foreign-born white population increased from 14.8 to 16.3 per cent.

**Finance.** For finances, see STATE FINANCES.

**Political and Other Events.** The control in New Jersey in the decade 1914-24 was divided between the Republican and Democratic parties, with the preponderance of power with the former. In 1914 the Republicans elected a majority in both branches of the Legislature for the first time since 1911. They also elected eight Representatives in Congress, and the Democrats, four. In 1915, at a special election on October 19, an amendment extending the suffrage to women was defeated. In elections held in November of this year, for members of the State Senate and the House, the Republicans increased their majorities in both branches of the Legislature. In 1916 elections were held for governor and for United States Senator. Walter E. Edge, Republican, was elected governor, and Joseph S. Frelinghuysen was elected to the Senate. In the presidential voting of this year, Charles E. Hughes received 268,982 votes; President Wilson, 211,018. The voters of Newark, on Aug. 9, 1917, adopted a commission form of government. In 1919 the Democrats elected their candidate for governor, Edward I. Edwards, but the Republicans held the Legislature. In 1920 the presidential voting gave Warren G. Harding 611,541 votes; James M. Cox, 256,887. In 1922 the Democrats were successful in electing George S. Silzer, governor; E. I. Edwards, United States Senator; and six Representatives in Congress. The Republicans held both houses of the Legislature. The chief issue of the campaign was prohibition. The Democratic candidates for governor and Senator openly opposed the State prohibition enforcement act and the Volstead Act. On Feb. 2, 1922, the State court of Errors and Appeals held the State prohibition enforcement law constitutional but "unworkable," and a new act was passed by the Republican Legislature. Governor Silzer, elected in 1922, was inaugurated governor on Jan. 16, 1923. A contest lasting eight weeks between the Governor and the Legislature over the appointment of a new highway commission ended with the confirmation of the Governor's nominations. The commission is headed by Gen. Hugh L. Scott.

**Legislation.** The Legislature in New Jersey meets annually. The most important acts in the decade 1914-24 are noted below. In 1914 the Legislature passed a home rule act affording cities under a commission form of government greater latitude in the administration of local affairs. In 1914 the Legislature passed a concurrent resolution extending the suffrage to women. As the amendment resolution had already passed the preceding Legislature, it was submitted to the people, as noted above, on October 19, and was defeated. The Legislature of 1917 amended the health laws of the State in important details. In 1918 the Legislature passed a local option bill and a supplement to the corrupt practices act and amended the child labor and other laws. A workmen's compensation bureau was created, as well as a department of charities and corrections with supervisory capacity over certain State institutions.

The Legislature also created an Inter-State Bridge and Tunnel Commission, a Board of Fisheries and a Boxing Commission. Several measures relating to the war emergency were passed at this session. In 1919 the laws relating to the State charitable, penal, and reformatory institutions were revised. Provision was made for the appointment of a commission to investigate the tax laws. This Legislature also passed a measure permitting a jury, as a part of its verdict, to recommend life imprisonment, in which case the death penalty shall not be imposed. The Legislature also enacted a child labor law and passed measures forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence against the government. The Legislature rejected the Federal prohibition amendment on Mar. 18, 1919. In 1920 the Legislature passed a measure permitting the manufacture and sale in the State of liquor containing 3.5 per cent alcohol. Provision was made for a retirement pension for police and firemen. A bond issue of \$28,000,000 for the share of New Jersey in the Delaware Bridge between Camden and Philadelphia, and the Hudson River vehicular tunnel between Jersey City and New York, was authorized. In 1921 the Assembly ratified the prohibition amendment, but it was defeated by the Senate. The 3.5 per cent alcohol act was repealed. The Legislature created in 1921 a Department of State Police. This bill was vetoed by Governor Edwards, but was passed over his veto. In 1922 the Legislature passed measures appropriating \$100,000 for the development of the port of New York, under a joint board of members from New York and New Jersey. The Legislature on Mar. 9, 1922, finally ratified the Eighteenth Amendment and passed laws for prohibition enforcement over the Governor's veto. It also authorized a bond issue of \$40,000,000 for the construction of good roads. In 1923 the Legislature passed a measure extending the payment of a soldiers' bonus to 1924; prohibited night work for women in factories after Dec. 31, 1924; authorized cities to adopt the city-manager form of government, and passed an act to prevent mob violence.

**NEW JERUSALEM, CHURCH OF THE.** This organization, commonly known as the New Church, which considers itself the organ of a new spiritual dispensation and not a denomination of the historic Christian church, teaches that the true doctrines of Christianity and the spiritual meaning of the Scriptures were revealed in the writings of Emanuel Swedenborg. The first society was established in 1787 in London and the first local organization in the United States in 1792. The General Convention of the New Jerusalem in the United States of America was founded in 1817. Owing to the adoption of a stricter method of counting, involving also the omission of Canadian members, the General Convention declined in number of societies from 96 in 1914 to 86 in 1924 and in membership from 6423 to 5959. Home missionary work was carried on during this period in the United States and Canada, and foreign missions in Denmark, France, Germany, Switzerland, Latvia, Czecho-Slovakia, Austria, Sweden, Japan, and British Guiana; and by the General Church and the British Conference also in South Africa and India. A missionary was sent to the Philippines in 1921, and the first

church established there. In the same year the federation of French-speaking New Church people was formed, and in August, 1924, a federation of German-speaking New Church people was organized. The various branches of the New Church, both British and American, in 1922 brought to completion the photofacsimile reproduction of Swedenborg's theological manuscripts (18 thick folio volumes, supplementing 10 others previously published) and the 100 sets were apportioned to church depositaries and large public and university libraries.

**NEWMAN, HORATIO HACKETT** (1875- ). An American zoölogist, born near Seale, Ala., and educated at McMaster University and the University of Chicago. He was instructor in zoölogy at the University of Michigan (1905-08); professor at the University of Texas (1908-11); and associate professor (1911-17), professor (1917- ), and dean of the colleges of science (1915- ), at the University of Chicago. He published *The Biology of Twins* (1917), *Vertebrate Zoölogy* (1919), and *Readings in Evolution, Genetics and Heredity* (1921).

**NEW MEXICO.** New Mexico is the fourth State in size (122,634 square miles), and the forty-third in population; capital, Santa Fé. The population increased from 327,301 in 1910 to 360,350 in 1920, a gain of 10.1 per cent. The white population increased from 304,594 to 334,673; Negro, from 1628 to 5733; native white, from 281,940 to 305,596; and the foreign-born white, from 22,654 to 29,077. The number of Indians in 1920 was 19,512, compared with 20,573 in 1910. The urban population of the State rose during the decade from 46,571 to 64,960; the rural, from 280,730 to 295,390. The only large city in the State is Albuquerque, which increased from 11,020 in 1910 to 15,157 in 1920.

**Agriculture.** While the population of the State increased 10.1 per cent in the decade 1910-20, the number of farms decreased 16.3 per cent (from 35,676 to 29,844). The acreage in farms, however, showed a decided increase from 11,270,021 to 24,409,638, or 116.6 per cent; and the acreage of improved land in farms increased from 1,467,191 to 1,717,224. The total percentage of the total area used for agricultural purposes increased from 14.4 in 1910 to 31.1 in 1920; but the percentage of farm land improved decreased from 13 to 7 per cent. The total value of farm property showed an apparent increase from \$159,447,990 up to \$325,185,599, or 103.9 per cent; the average value per farm from \$4469 to \$10,896. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 29,844 farms in 1920, 25,756 were operated by owners, 433 by managers, and 3655 by tenants. The comparative figures for 1920 were 33,398, 321, and 1957. White farmers in 1920 numbered 27,969, of whom 26,593 were native. Of the 1875 colored farmers, 1833 were Indians. White farmers in 1910 numbered 33,528; native white farmers, 32,088; and colored farmers, 2148. Farms free from mortgage in 1920 numbered 16,650, compared with 31,382 in 1910; those under mortgage numbered 6257, compared with 1775. The number of dairy cows decreased

from 51,451 in 1910 to 45,827 in 1920; "beef cows" increased from 579,601 to 797,077; both increase and decrease being due partly to change in classification employed in these years. Sheep decreased from 2,894,984 in 1910 to 1,640,475 in 1920; hogs increased from 45,409 to 87,906. The area under irrigation increased from 461,718 acres in 1909 to 538,377 acres in 1919. The estimated production of the principal farm crops in 1923 was as follows: corn, 3,429,000 bushels; spring wheat, 1,323,000 bushels; winter wheat, 446,000 bushels; oats, 1,735,000 bushels; barley, 258,000 bushels; potatoes, 336,000 bushels; and hay, 358,000 tons. Comparative figures for 1913 are: corn, 1,572,000 bushels; wheat, 1,221,000; oats, 1,500,000; barley, 96,000; potatoes, 612,000; and hay, 399,000 tons.

Mining. New Mexico is rich in mineral resources which have not yet been fully developed, principal among them, in order of importance, being coal, copper, silver and clay products. The progress of the mineral industry during the decade 1914-24 is indicated by a comparison of production figures for the principal minerals. The coal production was 3,877,689 net tons, valued at \$6,230,871 in 1914; 3,817,940 tons, \$5,481,361 (1915); 3,793,011, \$5,580,369 (1916); 4,000,527, \$7,455,166 (1917); 4,023,239, \$10,787,082 (1918); 3,683,440, \$13,568,000 (1920); 2,453,482, \$9,585,000 (1921). The increased value in 1920 and 1921 was due chiefly to the inflation of the currency and a corresponding decline in the purchasing power of money. The output of gold, copper, silver, lead and zinc for several years during the decade was as shown in the

whose duty it was to assist the various agencies throughout the State in the preparation of their financial budgets. The State, in 1917, took advantage of the Federal act which furnished aid to the States for the development of vocational education, under the provisions of the State law, the Board of Education being also the Vocational Board of Education; and vocational education was provided in both day and night schools. Vocational rehabilitation was also established with very satisfactory results. The total enrollment in the State in 1914 was 67,147. This had increased, in 1922, to 76,670 (50,093 in county rural schools, 10,845 in city schools, and 15,732 in town schools). The ordinary expenditure for all schools was \$4,362,756, in addition to which there were special levies amounting to over \$2,000,000. The percentage of illiteracy in the State decreased from 23.4 in 1910 to 18.9 in 1920: among the native white population, from 18.8 to 15.2; among the foreign-born, from 31.2 to 28.6; among the Negro, from 15.9 to 4.4.

Finance. For finance, see STATE FINANCES.

Political and Other Events. An election was held in 1914 for Representatives in Congress and for certain State officials. At this election three amendments to the State constitution were voted on and carried. One of these provided that State and county officials may succeed themselves. Another reduced the term of State and county officials from four to two years, and a third repealed the clause on taxation in the constitution and eliminated the State Board of Equalization. In elections the Republicans were

#### OUTPUT OF MINERALS IN NEW MEXICO

| Year | Copper<br>Pounds | Gold<br>Dollars | Silver<br>Fine ounces | Lead<br>Pounds | Zinc<br>Pounds |
|------|------------------|-----------------|-----------------------|----------------|----------------|
| 1914 | 59,307,925       | \$1,171,696     | 1,777,445             | 1,763,641      | 18,403,392     |
| 1916 | 92,747,289       | 1,382,480       | 1,766,274             | 8,214,189      | 36,570,649     |
| 1918 | 98,264,563       | 682,791         | 782,421               | 8,398,239      | 24,050,324     |
| 1920 | 54,400,691       | 480,302         | 768,042               | 2,869,525      | 10,013,580     |
| 1921 | 14,267,338       | 196,822         | 571,899               | 678,601        | 228,000        |
| 1922 | 31,937,207       | 412,693         | 752,240               | 3,012,223      | 4,496,806      |

table. The decrease in production in 1921 was due largely to the depression in business conditions which affected metal mining. In addition to the minerals mentioned, the State produces iron ore, sand and gravel, and stone. The total value of the mineral production in 1921 was \$13,227,268, compared with \$27,883,565 in 1920; \$22,679,960 in 1919; \$40,631,024 in 1918, and \$18,072,919 in 1914.

Manufactures. See UNITED STATES, *Manufactures*.

Education. There was steady development in education in New Mexico during the decade 1914-24. The elementary schools undertook to furnish education not only in the essential branches, but also in vocational training, including agriculture, domestic science, and manual training. The secondary schools during the 10 years of Statehood showed a remarkable increase in their development, the number having practically doubled and the ratio of attendance grown proportionately. In addition to these educational activities, the State provided for the education of the blind and the deaf and dumb. The county unit for administration purposes was developed in 1913 and supplemented by the county unit law of 1915 for purposes of taxation. In 1921, the Legislature made provision for an educational auditor,

generally successful. In 1916 the Democrats carried the State, electing A. A. Jones as United States Senator. In the voting for president this year, President Wilson received 33,527 votes; Charles E. Hughes, 31,152. The Democratic candidate for governor, E. C. De Baca, was elected, together with nearly half the other State officers. In 1918 the Republicans again returned to power and elected their candidate for governor, O. A. Larrozo. Albert B. Fall, Republican, was elected United States Senator. In 1920 elections were held for governor and other State officers. Merritt C. Mechem, Republican candidate, was elected governor. In the presidential voting of this year, W. G. Harding received 57,634 votes; J. M. Cox, 46,668. Senator Fall resigned in 1921 to become Secretary of the Interior in the cabinet of President Harding. At elections held to fill the vacancy caused by his appointment, Holm O. Bursum, Republican, was elected. The Democrats regained power in 1923, electing their candidate for governor, James F. Hinkle, and reelected Senator Jones for the Senate. Governor Hinkle was inaugurated in January, 1923. In his inaugural address he condemned the State policy of road construction, urged the abolition of county boards of education, and proposed a State-wide primary law.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. In the Legislature of 1915, a workmen's compensation law was passed by the House but was defeated in the Senate. The Legislature of 1917 enacted a workmen's compensation law and amended the statutes relating to the administration of justice. In 1919, the Legislature amended the tax laws and created a State Board of Dental Examiners and a Girls' Welfare Board. It also provided for the recodification of the general banking law and authorized the commission form of government in cities of 10,000 or more population. In 1921, the Legislature made additional provisions for the protection of game, regulated the hours of labor for children, regulated the practice of chiropractic, created the office of county flood commissioner, and provided for emergency flood districts and their administration. It also prohibited gambling in the State, provided for a succession tax, created a Department of Public Welfare, and regulated and limited the working hours of women. The Legislature of 1923 proposed an amendment to increase the term of State officers in the State executive department and county officers from two to four years, passed a measure making it a felony to sell or give liquor to minors, and passed bills to facilitate coöperative marketing of agricultural products; provisions were made for creating associations for this purpose.

**NEW ORLEANS.** The largest city of Louisiana, and a port of entry. The population rose from 339,075 in 1910 to 387,219 in 1920 and to 410,000 by estimate of the Bureau of the Census for 1924. The most extensive work carried on by the city during the decade 1914-24 was the improvement of the port and the inner harbor by the construction of the Industrial Canal joining the Mississippi River and Lake Pontchartrain, an arm of the Gulf of Mexico. The completion of this undertaking gave a new harbor of quiet water which varied 16 inches between high and low water as compared with the 19 feet variation of the river level, and also shortened the distance to deep water. The canal was  $5\frac{1}{2}$  miles long and 30 feet deep at low water, and was equipped with a concrete and steel lock 1020 by 150 feet and 68 feet from top to bottom. This was completed in 1923 and cost about \$20,000,000. The east bank of the river was built up a considerable height by pumping mud from the river bottom by pipe-line dredge. Four concrete fireproof cotton warehouses and a large grain elevator were built on this land. Active city planning was started in 1920.

The successful campaigns which have been waged in New Orleans since the beginning of this century against disease and the conditions responsible for epidemics in the past has attracted the attention of medical men all over the world. Yellow fever, malaria, typhoid, and bubonic plague have all practically been eliminated from the health records of the city through the destruction of cisterns, the installation of a model water purification plant, the rat-proofing of public buildings and docks, and the installation of an elaborate drainage system.

The value of building permits issued by the city increased from \$1,790,514 in 1918 to \$13,099,015 in 1923 and the property valuation from \$443,157,725 to \$521,956,873. Post office receipts rose from \$1,269,874 in 1914 to \$2,-

466,316 in 1923, and bank resources from \$245,563,932 in 1921 to \$297,017,705 in 1923. Exports in foreign commerce rose from 3,580,737 short tons in 1914 to 5,094,276 in 1922, and imports from 1,472,323 short tons to 5,119,663; coastwise shipping increased from 361,198 tons received and 603,863 tons shipped in 1914 to 957,623 tons received and 1,692,437 tons shipped in 1922. The number of persons engaged in manufacturing rose from 17,186 receiving \$8,020,000 in wages and making products worth \$78,794,000 in 1910 to 26,641 persons receiving \$24,614,000 in wages and making products worth \$182,799,000 in 1920. The number of public schools increased from 88 with an enrollment of 51,595 in 1920 to 108 with enrollment of 62,307 in 1924. In the years 1915-24, 60 miles of streets were newly paved, 54 miles of sewers laid, the fire department was motorized and 165 men were added to the personnel. See CITY PLANNING.

**NEW SOUTH WALES.** A constituent state of the Commonwealth of Australia in the south-eastern part of the continent. Area, 310,372 square miles; population in 1911, 1,650,470; in 1921, 2,100,371; average annual increase, 2.4 per cent. Sydney, the capital and largest city, with suburbs, had 955,900 inhabitants in 1922 (629,503 in 1911). Area under crops in 1912-13, 3,737,105 acres; in 1921-22, 4,445,828. Principal crops were wheat, maize, barley, oats, potatoes, and hay. Cane sugar, grapes, and citrus fruits were receiving increasing attention. Grazing was of course a leading activity. Wool production in 1921-22 was 285,418,000 pounds, a falling off from the 326,804,000 pounds of 1912-13. Mining in 1921 yielded (1912 figure in parentheses): gold, £271,302 (£702,129); lead, silver, and silver-lead ore, £864,502 (£3,481,266); tin and tin ore, £163,451 (£338,074); copper, £41,267 (£579,791); zinc, £283,455 (£1,766,242); coal, £9,078,388 (£3,660,015); iron, £639,376 (£130,708). Manufacturing pursuits engaged 148,876 employees in 1921-22 (115,561 in 1912). Metal works and machinery, and plants concerned with food industries, were the most important. In 1921, the value of production of the various industries was: pastoral, £20,057,000; agricultural, £32,373,000; dairying, £16,447,000; forests and fisheries, £4,089,000; mining, £13,096,000; manufacturing, £42,192,000; total, £128,254,000. Imports overseas for 1913 and 1922 were £32,350,600 and £43,321,500; exports for the same years, £32,839,800 and £47,757,400. Leading exports were minerals, wool, dairy products, and meats. In 1922, 5116 miles of railway were open; in 1913, the number had been 4197. The operations of the government showed great increases in the period 1914-22. Total revenues for 1913-14 and 1921-22 were £18,438,228 and £35,637,820. Expenditures for the same years were £18,065,189 and £36,966,525. The public debt on June 30, 1913, was £106,170,747; by 1923 it had increased to £187,879,492. The Labor party gained its first impetus in New South Wales and continued to control the government more or less regularly.

**NEW YORK.** New York is the twenty-ninth State in size (49,204 square miles), and the first in population; capital, Albany. The population increased from 9,113,614 in 1910 to 10,385,227 in 1920; a gain of 14 per cent. The white population increased from 8,966,845 to 10,172,027; Negro, from 134,191 to 198,483; na-

tive white, from 6,237,573 to 7,385,915; and foreign-born white, from 2,729,272 to 2,786,112. The urban population of the State rose from 7,185,494 to 8,589,844, while the rural decreased from 1,907,210 to 1,795,383. The growth of the principal cities was as follows: New York (1910), 4,766,883 to (1920) 5,620,048; Buffalo, 423,715 to 506,775; Rochester, 218,149 to 295,750; Syracuse, 137,249 to 171,717; Albany, 100,253 to 113,344 (see articles on these cities).

**Agriculture.** New York, in common with nearly all the eastern States, showed a decline in agriculture, as compared with growth of population, in the decade 1910-20. While the population of the State increased 14 per cent, 1910-20, the rural population decreased from 27.1 per cent in 1900 to 21.2 per cent in 1910 and 17.3 per cent in 1920. The number of farms decreased 10.4 per cent (from 215,597 in 1910 to 193,195 in 1920); total acreage in farms, from 22,032,367 to 20,632,803, or 6.3 per cent, and the improved land in farms decreased from 14,844,039 to 13,158,781 acres, or 11.4 per cent. The total value of farm property in the State showed an apparent increase of 31.5 per cent, or from \$1,451,481,495 in 1910 to \$1,908,483,201 in 1920; the average value per farm, from \$6732 to \$9879. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 193,195 farms in 1920, 151,717 were operated by owners, 4376 by managers, and 37,102 by tenants. The corresponding figures for 1910 were 166,674, 4051, and 44,872. White farmers in 1920 numbered 192,645, and colored farmers, 550. In 1910 the white farmers numbered 214,658 and the colored farmers, 939. The total number of cattle in 1920 was 2,144,244; in 1910, 2,423,003. The increase in number of dairy cattle, from 1,509,594 to 2,081,074, reflects the large growth of the dairy industry. The State had risen to second place in milk production, being exceeded only by Wisconsin. Sheep, in 1920, numbered 578,726, as compared with 930,300 in 1910; hogs, 600,560 as compared with 666,179. The estimated production of the principal crops in 1923 was as follows: corn, 24,408,000 bushels; spring wheat, 311,000 bushels; winter wheat, 7,895,000 bushels; oats, 32,552,000 bushels; rye, 945,000 bushels; barley, 5,168,000 bushels; potatoes, 29,813,000 bushels; tobacco, 2,272,000 pounds; buckwheat, 3,596,000 bushels; hay, 6,343,000 tons; and apples, 26,961,000 bushels. Comparative figures for 1913 are: corn, 15,020,000 bushels; wheat, 6,800,000; oats, 42,712,000; rye, 2,228,000; barley, 2,056,000; potatoes, 26,640,000; hay, 5,358,000 tons; and tobacco, 4,386,000 pounds.

**Manufactures.** New York is the most important of the manufacturing States, both in point of number of establishments and in value of product. In 1920, there were 58 cities with more than 10,000 inhabitants. These formed 78 per cent of the total population of the State, and in 1919 reported 87.5 per cent of the State's manufactured products. There were in the State 44,935 manufacturing establishments in 1909; 48,203 in 1914; and 49,330 in 1919. Persons engaged in manufacture numbered 1,203,241, 1,289,098, and 1,524,761; and

capital invested amounted to \$2,779,496,814, \$3,334,277,526, and \$6,012,082,567 in those years. The value of products amounted to \$3,369,490,192 in 1909; \$3,814,661,114 in 1914; and \$8,867,004,906 in 1919. The large increase in value of products from 1914 to 1919 was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase shown in number of wage earners clearly indicates decided growth in the manufacturing activities of the State. The most important industry in the State is the manufacture of women's clothing, the product of this industry being valued, in 1909, at \$272,518,000; in 1914, at \$345,316,000; and in 1919, at \$886,984,000. The manufacture of men's clothing ranks second in point of value: in 1909, \$266,075,000; in 1914, \$238,627,000; and in 1919, \$641,906,000. The refining of sugar, ranking third in this respect, was valued in 1914 at \$124,941,000, and in 1919, at \$268,318,000. Slaughtering and meat packing, in fourth place, had a product valued, in 1909, at \$127,130,000; in 1914, at \$148,106,000, and in 1919, at \$265,726,000. The printing and publishing industry was next in value of product: in 1909, \$216,946,000; 1914, \$257,268,000; and 1919, \$478,898,000. The most important manufacturing cities are New York, Buffalo, and Rochester. In New York, there were 25,933 manufacturing establishments in 1909, with a product valued at \$2,027,425,000; 29,621 in 1914, with \$2,292,832,000; and 32,590 in 1919, with \$5,260,708,000. Buffalo had 1753 establishments in 1909, with a product valued at \$218,804,000; 2225 in 1914, with \$247,516,000; and 2093 in 1919, with \$634,410,000. Similar figures for Rochester were: 1203 in 1909, with \$112,676,000; 1244 in 1914, with \$140,697,000; and 1367 in 1919, with \$351,416,000. The other important manufacturing cities are Albany, Binghamton, Niagara Falls, Schenectady, Syracuse, Troy, Utica, and Yonkers.

**Mining.** Although New York has limited metal mining, it ranked thirteenth among the States in 1921 in the value of its mineral products. The most important minerals are clay products, cement, stone, and salt. The progress of the clay and cement industries in the decade was as follows: In 1914 clay products were valued at \$9,078,933; in 1916, \$11,755,012; 1918, \$9,581,796; 1920, \$19,113,684; and in 1921, \$17,432,086. Shipments of cement in 1914 were 5,713,383 barrels valued at \$5,143,401; 1916, 5,707,892 barrels, \$5,804,444; 1918, 4,074,159, \$6,568,746; 1920, 6,049,150, \$12,206,698; 1921, 4,993,341, \$9,403,015. It will be noted that while the shipments of cement were practically the same in 1921, the price received was more than double, which was due chiefly to the inflation of currency. In addition to these two minerals, the State produces graphite, a considerable quantity of iron ore, mineral waters, natural gas, petroleum, and sand and gravel. The total value of the mineral production in 1921 was \$62,567,967, compared with \$78,431,317 in 1920; \$56,379,564 in 1919; \$52,768,877 in 1918; and \$36,420,134 in 1914.

**Education.** There was great progress in education in New York during the decade 1914-24. The Legislature in each year of that period passed a number of important measures.

In 1914, the establishment of the central rural schools was made possible, and in 1917 a measure was passed providing for central high-school districts; in the latter year, school elections in certain cities were regulated by the Legislature; amendments were made to the statutes relating to the boards of education in 1919; and in 1921 and 1922 the laws relating to compulsory education were amended. The Legislature of 1923 also made several important amendments to school laws: \$75,000 was appropriated for the erection of an additional building at the State College for Teachers; a measure was enacted requiring the Commissioner of Education to prescribe courses of instruction in fire prevention; and a law was passed providing for State schools of agriculture in St. Lawrence, Alfred, Morrisville, Cobleskill, Delhi, and Farmingdale, under the supervision and direction of the Regents of the University and the Commissioner of Education. Vocational education, in general industrial schools, trade schools, schools of agriculture and home economics (also in part-time or continuation schools), was being carried on in all the larger and most of the smaller cities of the State. The benefits of the Smith-Hughes Act providing for vocational education were accepted by a legislative measure in 1917. Farm schools were established in most of the counties of the State. The registration of pupils increased from 1,532,151 in 1915 to 1,820,506 in 1922; the average attendance increased from 1,233,074 in 1914 to 1,518,781 in 1922. The percentage of illiteracy in the State decreased from 6.6 in 1910 to 6.4 in 1920: among the native white population, from 1.1 to 0.7 per cent; among the Negro, from 5.8 to 3.4. Among the foreign-born white population, it increased from 14.3 to 15.2 per cent.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** There was an abundance of political and other happenings in New York in the decade 1914-24. The political complexion of the State was for the larger part of the time Republican, while New York City remained Democratic. Elections were held in 1914 for governor, United States Senator, and members of the House of Representatives. Gov. Martin H. Glynn, who succeeded to the post on the impeachment and removal of Governor Sulzer in 1913, was a candidate of the Democratic party for reelection. The Republican nominee was Charles S. Whitman, former district attorney of New York City. For United States Senator, James W. Gerard, Democrat, was opposed by James Wadsworth, Jr., Republican. Whitman was elected governor, and Wadsworth, Senator. At this election delegates to a constitutional convention were chosen. In February of this year, Joseph Cassidy, former Democratic leader of Queens Borough of New York City, was convicted for selling a nomination for the Supreme Court. With him was convicted William Willett, who paid Cassidy \$25,000 for the nomination. An attempt was made by an insane man in April of this year to assassinate Mayor Mitchel. The mayor escaped without serious injury. The constitutional convention authorized in 1914 began its session on Apr. 5, 1915, with Elihu Root as president. The session continued until September 9. The amendments proposed by the convention included woman suffrage and the adoption of a new constitution. The constitution was de-

feated by a large majority of 470,000; woman suffrage, by a vote of more than 200,000. In 1916 elections were held for United States Senator, governor, and other State officers. Senator Root declined renomination, and the Republicans nominated William M. Calder. A few weeks prior to the nominating primaries, Robert Bacon, former Secretary of State and ambassador to France, announced his candidacy; Calder, however, was nominated by a small majority. The Democratic candidate was William F. McCombs. Calder was elected Senator, and Governor Whitman was reelected. In the presidential voting of this year, Charles E. Hughes received 863,841 votes; President Wilson, 756,946. Elections were held for mayor of New York City and other cities in 1917. Mayor Mitchel was a candidate for reelection on a Republican-Fusion ticket. The Democrats nominated John F. Hylan, who was elected by a large majority. On Oct. 12, 1917, the new Catskill aqueduct carrying water to New York City was opened. In June of this year a census of all persons of the State under the age of 45 years was taken, with the purpose of assigning all to some sort of service. Two military cantonments were established, one for the National Guard troops at Camp Mills, Mineola, and the other for the National Army at Camp Upton, Yaphank. At the former were gathered troops of many States, including the former 69th Regiment of New York. In 1918 nominations were made for governor and other State officers at regular State primaries; the State convention had been abolished. Charles S. Whitman was renominated by the Republicans, and Alfred E. Smith, president of the Board of Aldermen of New York City, was named by the Democrats. Smith was elected by a close vote. In 1920 Nathan L. Miller was nominated governor by the Republicans, and Governor Smith was renominated by the Democrats. Mr. Miller was elected, and James W. Wadsworth, Jr., was reelected to the United States Senate. In the presidential voting of this year Warren G. Harding received 1,868,240 votes; James M. Cox, 781,485. At this election a referendum for a soldiers' bonus providing for a bond issue of \$45,000,000 was passed by a large majority. Investigations were held in 1920 by the legislative committee into housing conditions. The committee exposed much corruption in the building trades. In 1921 elections were again held for municipal officers. The chief interest was in New York City, where John F. Hylan was a candidate for renomination. He was opposed by Maj. Henry H. Curran, a candidate of various independent organizations. After a violent campaign, Hylan was reelected by a plurality of more than 400,000 votes. At this election several amendments to the constitution were carried. One of these provided for a literacy test for voting, including the requirement that the voters should know the English language. The Court of Appeals on Aug. 31, 1921, declared the bonus act passed in 1920 unconstitutional. In 1922 a new election law went into effect. This abolished the primaries for certain State offices. Judges and United States Senators were nominated by the convention, while candidates for the House of Representatives, for State Legislature, and for local officers were nominated by primaries. For governor, Nathan I. Miller was nominated by the Republicans, while the Democrats nomi-

nated Alfred E. Smith. For United States Senator, Dr. Royal S. Copeland was nominated by the Democrats; William L. Calder received the Republican nomination. Smith was elected by a large majority, and Dr. Copeland was elected to the Senate. In the Legislature, the Democrats secured a majority of one in the Senate, while the Republicans retained control of the Assembly by 14 votes. On Mar. 31, 1923, the Supreme Court held that the Anti-Saloon League was a political organization subject to the Corrupt Practices Law, and it was required to file a verified statement of campaign expenditures. In the election of November, 1923, the constitutional amendment providing for absentee voting was carried by a large majority. Another measure sanctioning a \$50,000,000 bond issue for State hospitals was also carried, and so was the proposal for a soldiers' bonus. Several other proposed amendments were defeated. On Dec. 9, 1923, the Cayuga Indians, after 111 years of exclusion, regained their representation in the supreme council of the six nations of the Iroquois confederacy. An inquiry was carried on in the House of Representatives in 1924 in regard to the right of Sol Bloom, elected on June 28, 1923, to sit as a member. It was charged by his Republican opponent, W. M. Chandler, that he had been elected by corrupt methods. The investigating committee decided in favor of Bloom. The Democratic national convention was held in New York City in June, 1924.

**Legislation.** The Legislature in New York meets annually. The most important acts during the decade 1914-24 are noted below. The Legislature in 1915 passed a measure providing pensions for widowed mothers. A bill providing for a referendum for State-wide prohibition was defeated in the Assembly. The Legislature in 1917 created a State food supply commission and provided for compulsory military training for boys between the ages of 16 and 18. The public health law was amended, and a State constabulary force was authorized. The Legislature of 1919 passed an income tax on April 7, and on June 16 it ratified the Federal woman suffrage amendment. A new tax measure enacted at this session included a graduated income tax. Bills for health insurance, a minimum wage for women and minors, and an eight-hour day failed to pass. This Legislature also passed a measure repealing the statute punishing as a crime attempts to commit suicide. The income tax laws were also amended. At the legislative session of 1920, five Socialist members of the Assembly, who were charged with disloyalty, were expelled. Three sedition laws passed by the Legislature were vetoed by the governor, and so were laws making Socialists ineligible for political office. In 1921 the Legislature reorganized the Public Service Commission and created a transit commission for New York City. It repealed the presidential primaries law and abolished the direct primary for United States Senator, State Supreme Court judges, and officers elected by the State at large. It also provided for the enforcement of prohibition and the Volstead Act by local authorities. This Legislature also passed a measure providing for the enlargement and improvement of the docking facilities of New York harbor, in conjunction with the adjoining State of New Jersey. The Legislature of 1922 passed several bills for the relief

of the housing situation. It also passed the so-called Port of New York Authority Bill. This Legislature also created a Veterans' Relief Commission, and by an amendment to the marriage law it made absence for five years a ground for divorce. In 1923 the Legislature repealed the Mullan-Gage Prohibition Enforcement Law so as to leave the enforcement of the prohibition law in the State entirely in the hands of the Federal government. At this Legislature a measure was passed compelling the Ku Klux Klan to lift the veil of secrecy. A measure was also passed making a robber who uses an automobile or motor vehicle in the commission of crime guilty of robbery in the first degree. The Legislature also passed a measure intended to reorganize the administrative machinery of the State government by abolishing the election of secretary of state, treasurer, and State engineer and surveyor. In 1924 the Legislature defeated bills to remove moving-picture censorship and to establish a censorship on books. A compromise transit law was passed which gave New York City power to complete and control new subways. The income tax law was revised.

**NEW YORK.** The largest city and seaport of America. The population increased approximately 18 per cent, from 4,766,883 in 1910 to 5,620,048 in 1920 and to 5,927,625 according to the estimate of the Bureau of the Census for 1923. Many elaborate enterprises were carried on by the city during the 10 years between 1914 and 1924. The rapid transit facilities were greatly extended by the addition of a third track for express service to the Second, Third, and Ninth Avenue elevated railroads in 1915, at a cost of \$26,000,000, and by the building of the dual system of subways. This involved the extension of the Fourth Avenue line up Lexington Avenue to Kingsbridge and Bronx Park and that of the Broadway subway downtown from Times Square to Brooklyn; the additions totaled about 45 miles of single track. The estimated cost was about \$330,000,000, of which the city was to pay a little more than half and the operating companies a little less. The vehicular tunnel under the Hudson River to Jersey City was begun in 1922. It consisted of twin tubes 29 feet, 6 inches in diameter, built of cast steel with a lining of concrete, with careful arrangements for ventilation. The Hell Gate railroad bridge was built over the East River from Long Island to the Bronx, a distance of 17,000 feet or more than 3 miles, with a single steel arch of 1000 feet span and a long concrete viaduct. The city built a viaduct which carried Park Avenue across Forty-second Street overgrade and led to an elevated roadway passing round the west side of Grand Central Station and connecting again at Forty-fifth Street with the northward prolongation of Park Avenue.

The water supply system was greatly extended. In 1917 the Catskill aqueduct was formally opened, some 12 years after the beginning of the development of that region. The whole Catskill system included the notable Ashokan and Kensico Dams and the siphons under the Hudson River and the Narrows and carried 250,000,000 gallons daily to the city. In the same year the Schoharie development was begun, involving the construction of the Gilboa dam, 160 feet high, to impound the waters of Schoharie Creek in a reservoir of 20,000,000,000 gallons capacity; and the Shandaken tunnel, 18 miles

OF THE  
UNIVERSITY OF ILLINOIS

long, to carry the water into the Ashokan reservoir. This was completed and opened in January, 1924.

The War Department ordered three of the piers of High Bridge to be removed from the centre of the Bronx River on the ground that they obstructed navigation. A long discussion followed as to the best method of fulfilling this demand; many urged that the old bridge be remodeled instead of demolished, because of its architectural beauty. In 1923 it was decided to replace the three masonry spans by a single steel arch, which was estimated to cost about \$716,000.

Through coöperation of the two States, the New York and New Jersey Harbor Development Commission, called the Port Authority, was appointed in 1917. Its work affects 12 municipalities. Twelve piers between 1026 and 1137 feet long and from 125 to 209 feet wide, connected by rail with all the main railroads of New Jersey, were built on Staten Island in 1920-22. Extensive dredging was carried on to provide a 40-foot channel between Upper Bay and Brooklyn, and Coenties Reef and Shell Reef, which had hindered traffic, were removed. The Central Railroad of New Jersey built the largest coal-handling terminal in New York harbor; it connects by approximately 23 miles of track and cost more than \$3,000,000. The Cunard Steamship Line began the construction of a group of eight piers 1000 feet long and one shorter pier at Weehawken, N. J., on the Hudson River, about opposite Thirty-sixth Street.

In 1916 a zoning plan was adopted by the city, to regulate the use to which buildings might be put, their height in relation to street widths, and the percentage of the area of the lots permitted to be covered. The commission in charge of framing the plan, which was the first to be adopted by a city of any importance, made a survey of the city and held public hearings. The height of buildings was regulated chiefly by the width of the street on which they fronted, with variations for different parts of the city. A tower covering not more than one-fourth of the area of the lot, however, might be carried to any height; set-backs might also be used to increase somewhat the permitted height for the rest of the building. The Russell Sage Foundation in 1922 announced the inauguration of a project to make an inclusive plan for New York City and its environs as far as Bridgeport, Conn.; West Point, N. Y., and Princeton, N. J., and including all of Long Island and a large part of the New Jersey coast. The preliminary work on the plan consisted of extensive studies by the Foundation along social, economic, and physical lines.

The value of imports through New York increased from \$1,040,380,526 in 1914 to \$1,797,819,713 in 1923. The exports increased from \$864,546,338 in 1914 to \$1,518,852,197 in 1922. Bank clearings rose from \$83,018,580,016 in 1914 to \$213,996,182,727 in 1923. The capital invested in manufacturing rose from \$1,364,352,683 in 1910 to \$3,013,436,656 in 1919, and the value of the products from \$2,029,692,576 to \$5,259,477,577 in 1919. The value of the four leading manufactures increased as follows: women's clothing, from \$266,471,381 in 1909 to \$866,243,561 in 1919; men's clothing, from \$218,411,030 to \$564,407,739; printing and publishing, from \$183,509,157 to \$411,138,928;

slaughtering, from \$95,862,000 to \$191,837,831.

**NEW YORK, COLLEGE OF THE CITY OF.** A free municipal college at Washington Heights, New York City, established in 1848 by the Board of Education of the city. The student enrollment rose from 7998 in 1914 to 18,755 in 1924, the faculty from 218 to 480 members, and the annual income from \$684,963 to \$1,395,678. The number of bound volumes in the main library, exclusive of pamphlets, increased from 47,589 to 66,165, and the volumes in the departmental libraries from 16,565 to about 20,000 volumes. Departments were established during the period in engineering and military science, the departments of Greek and Latin were consolidated into the department of classical languages, the department of natural history was divided into the departments of biology and geology, and the department of political science into departments of economics and government and sociology. A course leading to the degree of Bachelor of Science in Social Science, in addition to the previously existing courses leading to the degrees of Bachelor of Arts and Bachelor of Science, was established in 1916. The Brooklyn branch of the evening session was begun in the following year and the entire evening session was opened to women; also, in 1917, a summer session was established. In 1919, the first professional schools, of Technology and Business and Civic Administration, with their own deans and faculties, were founded, and the college was given the name of the College of Liberal Arts and Science. The work of the School of Business was carried on not only in the Washington Heights buildings and the evening session in Brooklyn, but also at the original building of the college at Twenty-third Street and Lexington Avenue. The third professional School of Education was founded on similar terms in 1921; its work was carried on in the Washington Heights buildings and at various centres in different boroughs in the city. President, Sidney Edward Mezes, Ph.D., LL.D.

**NEW YORK PHILHARMONIC SOCIETY.** See *MUSIC, Orchestras*.

**NEW YORK STATE COLLEGE FOR TEACHERS.** A coeducational State institution for the training of high-school teachers at Albany, N. Y., founded as a State normal school in 1844, and chartered as the State College for Teachers by the Board of Regents in 1905. Courses are offered in liberal arts and sciences, in commercial education, and in household economics, and a graduate course in education. The student enrollment was increased from 450 in 1914 to 971 in 1923-24, and the income from legislative appropriations increased from \$97,000 to \$260,000. In 1923, the Legislature appropriated money for the construction of William J. Milne Hall, providing facilities for a practice high school, laboratories in household economics and biology, and a large lecture hall and recitation rooms; and the alumni pledged \$150,000 for a residence hall. In addition to a special reference library the college uses the State Library of 1,500,000 volumes, Abram Royer Brubacher became president in 1915.

**NEW YORK SYMPHONY ORCHESTRA.** See *MUSIC, Orchestras*.

**NEW YORK UNIVERSITY.** A non-sectarian institution in New York City, char-

tered in 1831. The university increased its enrollment from 5233 in 1914 to 16,482 in 1923-24. The Graduate Division of Business Administration was established in 1916; two new degrees were authorized—Master of Business Administration in 1920 and Doctor of Commercial Science in 1923—and the Division of Oriental Commerce and Politics was inaugurated. The Ingram Institute for Economic Education and the School of Retailing were founded in 1918, and the degree of Master of Science in Retailing was authorized in 1921. In 1920, the name of the School of Applied Science was changed to the College of Engineering. A steam engineering plant was built in 1919 and the Sage Engineering Building, for which about \$250,000 worth of equipment was assembled, was authorized in the same year. The engineering research laboratory was built at University Heights in 1920-21 at a cost of \$345,000. Evening courses were started in the college in 1921, and in 1923 plans were made for courses in aeronautical engineering. During the summer of 1918, the faculties and equipment of the Engineering College were placed at the disposal of the government for training soldiers.

The Medical College was opened to women in 1918. In 1921, the State bacteriological laboratory was built at a cost of \$105,000, and the Helen Hartley Jenkins gift of \$150,000 was received. Medical preparatory courses were offered at the Flower Hospital, and medical and dental preparatory courses in the evenings at the Washington Irving High School. During the War, instruction was given at the college to Medical Reserve Corps officers. The School of Pedagogy was renamed the School of Education and an undergraduate division was established. By arrangement with the Chautauqua Institution in 1923, summer courses in education were given at Chautauqua, N. Y. The Vet-

1921, 1,218,913; average annual increase, 2.2 per cent. Estimated population in 1923, 1,271,741. Maoris in that year numbered 53,560. The birth rate in 1921 was 23.34 per 1000 (26.48 in 1912); the death rate, 8.73 (8.87 in 1912); and the marriage rate, 8.69 (8.81 in 1912). In 1922, the excess of immigration over emigration was 7402 (in 1912, 8927). Estimated populations of chief towns, with suburbs, on Apr. 1, 1923 (1911 figure in parentheses): Auckland, 167,760 (102,676); Wellington, 112,070 (70,729); Christchurch, 113,400 (80,193); Dunedin, 75,050 (64,237). At the end of 1922 there were 2550 public primary schools with a registration of 242,466; 36 endowed secondary schools with 10,736 pupils; 146 native schools with 6161 pupils; 4 university colleges with 3683 students. The total expenditure for public education in 1921-22 was £3,497,000; in 1912-13 it had been £1,334,599.

**Agriculture.** Of the total area of 66,292,232 acres in the Dominion, 27,390,625 acres had been alienated, including 9,978,608 acres reserved by the state, and 5,066,197 acres were held by natives. Deducting barren lands, roads, etc., only some 3,000,000 acres remained to be disposed of by 1921. The cultivated area increased, for in January, 1923, 18,417,489 acres were under cultivation, as compared with 16,265,890 acres in 1910-11. The great proportion of the land was under grass seed. The wheat area consistently increased, reaching 352,918 acres in 1922 (189,869 in 1913) while oats showed the greatest loss, dropping from 386,786 acres in 1913 to 170,655 in 1922. Pastoral pursuits were far more important. Over the period 1911-23 these activities held their own. Live stock for 1911 and 1923 showed: horses, 404,284 and 330,818; cattle, 2,020,171 and 3,480,694; sheep, 23,996,126 and 23,081,439; swine, 348,754 and 400,889. Exports of pastoral products for 1913 and 1922 were:

| Year       | Wool        | Frozen Meats        | Butter       | Cheese       |
|------------|-------------|---------------------|--------------|--------------|
| 1913 ..... | 186,533,036 | lbs. 2,578,693 cwt. | 372,258 cwt. | 611,633 cwt. |
| 1922 ..... | 321,533,215 | " 3,518,004 "       | 1,120,200 "  | 1,161,196 "  |

erinary College was temporarily closed in 1922. The productive endowment increased from \$1,225,227 in 1914 to \$2,923,988 in 1924, and the budget from \$592,391 to \$2,353,132. During the 10 years the following buildings were bought or erected: the Trinity building for the Wall Street division of the School of Commerce (\$222,670), the university apartment house (\$340,000), an addition to the chemistry laboratory at University Heights (\$45,000), and a residence house at University Heights (\$8650). Five floors of the Washington Square building were taken over and altered for classroom use at a cost of \$640,000 and the mortgage was reduced from \$550,000 to \$350,000, additional space was leased in the Greenwich building, and the Moynihan property was acquired at a cost of \$25,000. Between 1914 and 1923, the gifts received totaled \$4,031,619. The total assets of the university increased from \$5,970,418 to \$8,582,692. Chancellor, Elmer Ellsworth Brown, Ph.D., LL.D.

**NEW ZEALAND.** A British dominion in the southern Pacific, made up principally of North and South Islands, with Stewart Island included. Area, 103,862 square miles; population in 1911, exclusive of Maoris, 1,008,468; in

During the decade, wool production consistently declined except for the years 1919 and 1922, while dairy products rose regularly. By 1922-23, 41 per cent of the exports were made up of dairy products and only 26 per cent wool.

**Manufacturing.** From 1910 to 1921 advances in manufacturing were important. While factories only increased from 4402 to 4804, the number of hands increased from 56,234 to 70,255 and capital from £16,731,359 to £39,564,837. The total value of products in 1920-21 was £82,473,569; of this, meat freezing and preserving accounted for £13,669,102; butter and cheese factories, for £19,002,047. Hydro-electric schemes were under consideration after the War because of the decreasing local coal production. A plant was being erected at Mangahao (North Island) which was to supply eventually 160,000 horse power. Similar projects were reviewed for South Island.

**Mining.** Gold production continued to decrease; exports in 1906 were 563,843 ounces; in 1921, 149,595. The coal consumption in 1921 was 1,755,912 tons, of which about one-fifth was imported, mainly from Australia.

**Commerce.** Imports for 1913, 1920, and 1922-23, were £22,288,302, £61,595,828, and £37,-

330,000. Exports for the same years were £22,986,722, £46,441,946, and £45,549,000. The favorable balance of £8,219,000 for 1922-23, among the highest for the period, was surpassed only in 1915, 1917, and 1919. Proportions\* of value by countries of origin of New Zealand's imports for 1913 and 1921 were: the United Kingdom, 60 and 50 per cent; other British possessions, 24 and 26 per cent; the United States, 9 and 18 per cent. Proportions for exports were: the United Kingdom, 80 and 87 per cent; other British possessions, 14 and 6 per cent; the United States, 3 and 6 per cent. For 1922-23, imports from the United States dropped to £5,378,000. The most important American products were automobiles and machinery. In 1913, 645 vessels of 1,738,985 tons entered and 635 vessels of 1,699,807 tons cleared New Zealand ports; in 1921, 678 vessels of 1,940,236 tons entered and 678 vessels of 1,944,341 tons cleared.

**Communications.** In 1923 there were 3028 miles of government-owned railways and only 135 miles of private lines. In 1914 government railways aggregated 2863 miles.

**Finance and Economic Conditions.** Total revenues were, for 1913-14, £11,961,493; for 1921-22, £28,127,000. Total expenditures for the same years were £11,825,864 and £28,466,838. Estimates for 1922-23 were: revenues, £26,250,000, and expenditures, £29,438,215. The public debt in 1914 was £99,730,427; in 1922, £219,054,385, of which war expenditures (1914-19) accounted for £80,000,000. The cost of living steadily mounted over the period 1913-22. Retail price figures, based on the 1909-13 average as 1000, were: for 1913, 1034; for 1918, 1346; for 1921, 1620. Wages kept pace, as may be seen by the following index numbers, also based on the 1909-13 average as 1000: 1918, 1231; 1921, 1697.5; 1922, 1746.35. The exchange for the pound sterling was: 1913, \$4.86; 1921, \$3.84; 1922, \$4.43; 1923, \$4.567.

**History.** The break-up of the Liberal party gave the Reform party its first opportunity in 21 years. On the failure of Sir Joseph Ward to form a ministry and after another unsuccessful attempt on the part of the Liberals, W. F. Massey, leader of the Opposition, created a Reform government on July 10, 1912. For the next decade his dominant personality ruled the political destinies of the Dominion. Important administrative reforms were undertaken, aiming at further decentralization in the governmental machinery as well as reformation of the legislative council. The land question, which had always been vexing, was brought nearer to settlement when the law of 1912 allowed settlers on improved land to purchase their holdings. It became evident therefore that the state had relinquished its early policy in the direction of state participation in the benefits of the accumulated unearned increment. The extreme state socialism which had been typical of New Zealand history up to 1911 and which was made possible by the union of the Labor elements with the Liberal party, was abruptly terminated as the industrialization of the country proceeded and the stratification into classes became more perceptible. The farmers had become more conservative as bulwarks were erected for the safeguarding of private property; the laboring classes had become more radical with the appearance of a wealthy group in the population. The result was the growth of

the Labor party, on one hand, and on the other, the decision of workers not to accept decrees of the Arbitration Court but to try their strength in the strike. Bitter industrial conflicts became frequent, those of 1912 and 1913 being characterized particularly by ill-feeling.

The War momentarily put a period to all internal questions. Volunteer forces were raised for action in German Samoa; the government was empowered to fix prices and to suspend the labor laws; rent laws were passed (1916), and in 1915 a coalition cabinet was formed for the more effective prosecution of the War. In 1916 a conscription act was passed, though not without opposition, for in 1917, the coal miners went on strike to secure total exemption. Before the end of the War a total of 124,121 men had been enrolled in the army, about 90,000 of them volunteers. War financing was based on loans rather than revenues, although some increases were made in taxation, notably in higher income taxes, stamp duties, customs, railway fares, etc. Beginning with 1916 several loans were floated to an approximate total of £100,000,000. The easy success with which all this was accomplished was due to the unprecedented prosperity which the Dominion enjoyed throughout the War. Most of New Zealand's exports, meats, cheese, wool, hides, sheepskins, were contracted for by the British government, and though prices were fixed, sales reached enormous proportions. By 1921, more than £160,000,000 in produce was sold in this fashion. In spite of the rise in the cost of living, therefore, no class of society was touched by want. Through the fixing of prices of household necessities by the Board of Trade, the importation of wheat in 1918, when a local shortage impended, and the purchase of sugar abroad, retail prices were kept within reason. By the agency of the Court of Arbitration wages were reviewed and increased to meet mounting costs.

In 1919 the coalition came to an end with the withdrawal of Sir Joseph Ward from the cabinet. The election which followed indicated the increasingly radical temper of Labor. The marked syndicalist tinge which industrial agitation had taken on was reflected in the outspoken socialist political platform of the Labor party. The election results, however, showed the inherent conservatism of the average voters. Massey's Reform party elected 47 members, the Liberals only 20, and Labor 8, although the popular vote showed a ballot hardly in proportion to the great victory of the Reform party. This was due to the three-cornered fight in most constituencies. Labor troubles continued through 1919 and 1920, and the latter year was marked by a general strike of the railway workers. The world depression of 1921, which struck the farmers in particular, and the general unemployment were reflected in the political realignments. In the 1922 elections the government seats were reduced to 38; Liberals elected 25; Labor, 17. Two questions of importance locally were the status of the repatriated soldiers and the vote on prohibition. Beginning with 1915 pension and settlement acts were put on the statute-books, so that by 1921 upward of 35,000 pensions had been granted and more than 7000 soldiers settled on the land. A repatriation department was created for the vocational guidance of men who had fought in the War. By 1922 more

than £30,000,000 had been spent in this work of repatriation. Polls continued to be taken on national prohibition. By the law of 1918 a triennial vote was ordered on three alternatives, prohibition, license, and state control. A majority of the total vote cast was made necessary for passage. The 1919 vote gave prohibition only a plurality. The same was true also of the 1922 vote.

The appointment of Lord Jellicoe in 1920 as governor general of the Dominion brought the question of national defense to the forefront as an issue of major importance. The question of an independent New Zealand naval unit came up for serious consideration time and again. The Dominion appeared to accept complacently its status under the Empire, and although it had a place as a member of the League of Nations and also had a mandate over German Samoa, there was no movement in public opinion toward a wider independence.

**NEY, ELLY** (1882- ). A German pianist, born at Düsseldorf. After graduation from the Cologne Conservatory, where her teachers were I. Seiss and K. Böttcher, she went for further study to Leschetizky and Sauer in Vienna and won both the Ibach and the Mendelssohn prizes. For several years she taught at the Cologne Conservatory. Her tours of Germany, Austria, Russia, and Scandinavia established her reputation as one of the greatest of contemporary pianists, irrespective of sex. At her American debut (New York, Oct. 15, 1921) she took her audience by storm and immediately became a prime favorite. She later made annual tours of the States. In 1911 she married the Dutch conductor, Willem Van Hoogstraten.

**NICARAGUA.** The largest of the Central American republics, with an area estimated at 49,200 square miles; population (according to census of 1920), 638,119. In 1910 the population was estimated at 600,000. At least 75 per cent of the inhabitants lived in the western half of the country. Capital, Managua, with a population of 60,342. Other large towns are: Leon (47,234), Granada (21,925), Matagalpa (32,271), Masaya (17,287). Illiteracy among the population was still high, and school attendance was not much in excess of that of 1912. In 1922-23 there were 344 elementary schools with 21,657 pupils.

**Industry and Trade.** The agricultural products of the western half were varied; coffee, sugar cane, wheat, cacao, and beans were grown. The average annual crop of coffee was placed at 25,000,000 pounds. In 1921, the export value of coffee was \$2,352,487, and the 1922 exports were worth \$2,300,572. Sugar exports in 1921 were worth \$91,308,653. The sugar industry took its inception from the great demand created during the War. Exports of sugar in 1916 totaled only 3034 metric tons; in 1922, this export was 9948 tons. The export to the United States alone in 1923 was valued at \$842,697. The banana was the principal crop grown in the east. The banana exports in 1923 were 3,487,985 stems, compared with 2,617,765 in 1922. Timber and forest products also played an important part in Nicaragua's foreign trade. Gold exports averaged \$1,000,000 yearly. Practically all exports of lumber and gold went to the United States. In 1922 imports into Nicaragua were valued at \$5,123,505 (\$5,604,300 in 1913); exports in 1922, \$7,-

903,446 (\$7,494,100 in 1913). Proportions in 1922 by countries of origin of imports were: the United States, 80 per cent (50 in 1912); the United Kingdom, 9 per cent (19 in 1912); France, 2 per cent (5 in 1912); Germany, 1 per cent (12 in 1912). Leading imports were cotton goods, chemicals, iron and steel, and wheat flour. Proportions in 1922 by countries of destination of exports were: the United States, 71 per cent (46 in 1912); France, 16 per cent (16 in 1912); the United Kingdom, 3 per cent (13 in 1912). The 1919 foreign trade was the largest in the history of the country; this was due to the excellent return received for the large coffee crop. Total exports were \$12,409,473. Almost 28 per cent of Nicaragua's exports were taken in that year by France. France's decision to resume her high duties on coffee accounted for the decreased value of shipments in the ensuing years. The isolation of the Atlantic coast, with communications between the west and the east by way of Costa Rica and Panama, led the government to survey a route from San Miguelito on Lake Nicaragua to Monkey Point on the Atlantic, and in 1921 a loan of \$9,000,000 was secured in New York for this and other purposes. The national railways also passed into the hands of New York bankers for \$2,000,000. In 1920 also, work was begun on a railway from Chinandega to Playa Grande on the Gulf of Fonseca, as a link in the International Railways chain. Total railway mileage in January, 1924, was 145 miles, exclusive of small private lines. There were 3637 miles of telegraph wire and 805 miles of telephone wire in 1921.

**Finance.** For 1921-22 revenues were \$2,803,244 (\$2,479,313 in 1914) and expenditures \$2,787,673 (\$1,980,328 in 1914). Total external debt in February, 1922, was \$5,911,362; internal debt, \$3,462,884. As a result of the ambitious financial scheme of 1917, the size of the debt consistently decreased. By the programme a rigorous budget was laid out; financing of deferred interest was provided for; the floating debt was settled. Credit so improved that in 1921 a loan of \$9,000,000 was raised, part of which was to be applied toward the redemption of the 1909 bonds. The total indebtedness of Nicaragua on Mar. 31, 1923, was \$9,294,781. On Dec. 31, 1923, there were only 2,581,609 cordobas (1 cordoba = \$1) in circulation.

**History.** The continued interest of the United States in Nicaraguan affairs aroused the hostility of other Central American republics, and two of these, Costa Rica and Salvador, were led to sue Nicaragua in the Central American Court of Justice when the Bryan-Chamorro treaty was finally ratified by both parties in 1916. By this instrument, for the payment of \$3,000,000 the United States acquired exclusive canal rights in Nicaragua, permission to construct a naval base on the Gulf of Fonseca, and the Corn Islands. Though the suits were successful, the decision was disregarded by Nicaragua and the United States. The continued stay of American marines in the country ensured the permanence of the government in power. Border outbreaks in 1921 and revolutionary disturbances in 1922, which for a time led to an attack on Chinandega by rebels, and a move on the capital in August, 1922, caused the holding of a conference by the presidents of Nicaragua, Honduras, and Salvador, on board the U.S.S. *Tacoma* in Fonseca Gulf on Aug. 22,

1922. Steps were taken to check revolts fomented by political emigrants and for the putting down of border uprisings by united action. The purpose of the general treaty of peace and friendship signed on Dec. 20, 1907, by all the Central American countries was reaffirmed. This move, fostered by Nicaragua, was in strange disharmony with its refusal to join the Central American Union erected in 1921. Nicaragua did, however, participate in the subsequent Central American conference at Washington and in the treaties signed there. (See CENTRAL AMERICAN UNION.) On May 8, 1917, Nicaragua declared war on Germany and as an Associate Power became an original member of the League of Nations. The president for 1916-20 was Emiliano Chamorro; for 1920-24, Dr. Diego Manuel Chamorro. The untimely death of Dr. Chamorro on Oct. 19, 1923, necessitated the ad interim assumption of presidential powers by the vice president, Bartolomeo Martinez, pending the election of a new president in October, 1924. For this election a new electoral law, drafted by an American, Dr. H. W. Dodds, secretary of the National Municipal League, had been adopted, and Dr. Dodds was invited to assist in installing the new system. An offer by the Washington government to withdraw the force of American Marines which had been stationed in Nicaragua since 1912, unless the Nicaraguan government desired their continued presence to safeguard electoral freedom, elicited the reply that the Nicaraguan government desired the Legation guard to remain at least until the installation of a new administration in January, 1925.

**NICHOLAS** (NIKOLAI NIKOLAEVITCH), GRAND DUKE (1856- ). A Russian general (see VOL. XVII). At the outbreak of the War he was given the supreme command of the Russian armies, and handling them with admirable skill, successfully overran East Prussia and caused such rearrangement of German plans as to relieve materially the hard-pressed French and British. Although defeated at some points by the great masses of Prussian shock troops hurled against him, he succeeded in extricating his armies from awkward positions in the Carpathian passes, and the Allies esteemed it a tragedy of first magnitude when domestic politics in 1915 induced the Czar to take Nicholas's place himself. The Grand Duke was sent to the Caucasus and there carried out the successful campaigns of Erzerum and Trebizond. After the revolution he lived in retirement, first in the Crimea, and then in a small village near Paris. In 1924 conservative Russians everywhere looked to him as the man most likely to accomplish national restoration in Russia.

**NICHOLAS II** (1868-1918). Emperor of Russia from 1894 (see VOL. XVII). The reactionary influences about the Emperor and his fatalistic temper prevented him from making any effective resistance during the early part of the War to those intent on his downfall. In March, 1917, when the President of the Duma telegraphed him demanding his abdication, he submitted with very little protest. He abdicated in favor of Grand Duke Michael, refusing to hand the power over to his son for fear of exposing the latter to the political storm that was brewing. The Grand Duke declined to accept the honor, unless the crown was tendered to him by the will of the people. At first it was planned to send the Imperial

family to England, but the Provisional Government would not allow this, and Nicholas and his wife, son, and four daughters were transferred from Pskov to Tsarskoe Selo and then to Tobolsk, where they remained for several months. In 1918 they were taken to Ekaterinburg and given an apartment of only three rooms, and when Kolchak advanced in the Ural, the Communists, at a secret meeting, decided to put the Czar and his family to death. They were all shot in the cellar of the house where they had lived, and their bodies were removed to an isolated spot near Ekaterinburg and burned. A few pieces of their clothing were afterward found at the place.

**NICHOLS, ERNEST FOX** (1869-1924). An American physicist (see VOL. XVII). He was professor of physics at Yale University from 1916 to 1920; director of pure science at the Nela Research Laboratories at Cleveland, Ohio, during 1920-21; and president of the Massachusetts Institute of Technology from March to November, 1921.

**NICHOLS, J(ESSE) BROOKS** (1885- ). An American manufacturer, born at Dunkirk, N. Y., and educated at Yale University. From 1922 he was first vice president of the Franklin Baker Company, manufacturers of coconut products. After attending the Plattsburg Training Camp, he was commissioned first lieutenant in the United States Army, in 1916. He was later promoted to be captain and major and served in the North Russian campaign in 1918-19. He received the Croix de Guerre and other decorations from foreign countries. In 1920 he was commissioned lieutenant-colonel in the Officers' Reserve Corps.

**NICHOLSON, WILLIAM** (1872- ). A painter and engraver, born at Newark, England, and educated at the Magnus School in Newark and at the Julien Academy at Paris. As a student he produced good experimental work in wood engraving by using bold masses of black and white or of sombre grays and browns relieved by touches of bright color. He engraved many portraits, illustrated books, and collaborated with James Pryde in designing posters under the name of the Beggarstaff Brothers. During the War he contributed to the set of lithographs, "Britain's Aims and Ideals." As a painter he is known best for interior and still life subjects, although he has painted portraits and landscapes. He is represented in the Luxembourg and in many English galleries.

**NIEHAUS, CHARLES HENRY** (1855- ). An American sculptor (see VOL. XVII). He has been remarkably prolific during recent years. His works include the Paul Jones monument at Washington, D. C.; the Commodore Perry monument, Buffalo, N. Y.; statues of Zachariah Chandler and Governor Click, National Capitol; Hernandez Cortez, Panama-Pacific Exposition; Francis Scott Key Memorial, Baltimore (1922), and war memorials at Hoboken and Newark, N. J.

**NIELSEN, FRED KENELON** (1879- ). An American lawyer, born in Denmark, and educated at the University of Nebraska and the law department of Georgetown University. After admission to the bar he practiced law in Washington and was special agent of the General Loan Office from 1909 to 1911. From 1913 he was assistant solicitor to the Department of State, and in 1914, delegate at the con-

ference to conclude the treaty for the government of Spitzbergen. He served during the War as a major in the United States Army. At the Paris Peace Conference he was in charge of matters relating to treaties and claims against the enemy governments, and he was American representative in the drawing up of other treaties. President Wilson appointed him solicitor for the Department of State in 1920. He was reappointed to this position by President Harding. He served as technical expert at the Disarmament Conference in 1921-22.

**NIELSEN, LUDOLF** (1876- ). A Danish composer, born at Nørre-Tvede, Denmark. At the Copenhagen Conservatory he studied under V. Tofte (violin), A. Orth (piano), and F. Hartmann (composition), and in 1903-04 he attended the Leipzig Conservatory. As winner of the Ancker stipend he spent the year 1907 in travel and study in Germany, Austria, and Italy. From 1897 to 1907 he was solo violist and assistant conductor of the Tivoli orchestra and viola of the Björvig Quartet. He later lived in Copenhagen as teacher and composer. He wrote two operas, *Isabella* (Copenhagen, 1915) and *Uhret* (not produced up to 1924); three symphonies; the symphonic poems *Ragnar Lodbrog*, *Sommernatsstemning*, *In Memoriam*, *Fra Bjaergene*, and *Babelstaarnet*; *Romanze* for 'cello and orchestra; *Herbstabend*, recitation with orchestra; *St. Hans* for baritone, chorus, and orchestra; two string quartets; and choruses, songs, and piano numbers.

**NIEMEN RIVER.** See MEMEL.

**NIGERIA.** A British colony and protectorate in West Africa. The colony has an area of 1400 square miles; the protectorate, made up of the northern and southern provinces, has an area of 335,000 square miles. The total population was about 18,500,000, of whom 2800 were Europeans. The leading products of economic importance, measured by exports, were: nuts and palm kernels, exports in 1913, £3,109,818; in 1921, £3,574,184; palm oil, exports in 1913, £1,854,384; in 1921, £1,653,387; raw cotton, exports in 1913, £159,223; in 1921, £530,280; cocoa, exports in 1913, £157,480; in 1921, £350,085; tin, exports in 1913, £568,428; in 1921, £714,659; ground nuts, exports in 1913, £174,716; hides and skins, exports in 1913, £197,214; in 1921, £175,567. Other products were rubber, mahogany, ivory, live stock, ostrich feathers, and capsciums. Exports for 1913, 1920, and 1923, were £7,352,377, £16,987,018, and £11,672,000. Imports for the same years were £7,201,819, £25,216,507, and £11,457,000. Leading imports in 1921 were cotton piece goods and coopers' stores. High prices accounted for great advances manifested in the trade records of the years immediately following the War, though the year 1921 saw its world-wide depression reflected in Nigeria too. Shipping figures indicate the state of affairs: tonnage entered and cleared for 1913, 1920, and 1921 was 1,735,036 tons, 1,434,222, and 832,721. The importation of spirits was prohibited in 1919 with the result that a customs tax was placed on exports to fill out the territory's revenues. Imports came mostly from the United Kingdom and the British colonies. In 1921, however, imports from the United States totaled £811,237. In 1923, of the total trade, 75 per cent was with the United Kingdom, 8 per cent with the United States, and 8 per cent with Germany. In 1924, 1250

miles of railway were open. Since 1914 an important line completed was the Port Harcourt-Enugu Ngwo of 151 miles, which opened up the colliery at Enugu Ngwo. Plans were laid for the extension of this railway to the north beyond the Benue River, to reach to Makurdi on the Benue in 1914. There was a network of excellent motor roads in the southern provinces, as well as several thousand miles of telegraph wire.

The cost of government mounted during the period 1914-24. Revenues increased from £3,462,507 in 1913 to £5,734,961 in 1924-25 (estimated), and expenditures from £2,916,801 to £5,995,582. The debt in 1913 was £8,267,569; in 1922, £13,609,209. The system of administrative centralization inaugurated in 1914 was continued. In 1917 an uprising in the West gave the government some concern, but it was soon checked. In 1923, to extend more fully the idea of local autonomy, the British government granted the whole of Nigeria a new constitution, embodying a provision for the erection of a legislative council.

**NINE POWER OPEN DOOR TREATY.**

See CHINA, *History*.

**NITROGEN, FIXATION OF.** See CHEMISTRY; FERTILIZERS.

**MITTI, FRANCESCO SAVERIO** (1868- ). An Italian statesman and author. He occupied many positions in the government and from 1911 to 1914 was Minister of Agriculture, Industry, and Commerce. He favored Italian intervention on the side of the Allies in the War and was a member of the special Italian mission to the United States in 1917. On his return he was appointed Minister of the Treasury. On the fall of the Orlando ministry in June, 1919, he became Prime Minister and held this office until May, 1920. He was for a time professor of economics at the University of Naples.

**NIVELLE, ROBERT GEORGES** (1856-1924). A French soldier, of English ancestry on his mother's side. He entered the artillery service of the army and at the outbreak of the War was a colonel. He greatly distinguished himself in the retreat from Mons and in the battle of the Marne in September, 1914, and was promoted to be chief assistant of General Pétain in the defense of Verdun. He succeeded to command in that sector and initiated and carried out a counteroffensive which, on Oct. 24, 1916, regained the forts of Douaumont and Vaux. He was appointed successor to General Joffre as commander-in-chief of the French armies of the North and East on Dec. 12, 1916. He planned and undertook a grand offensive on the Aisne front which failed to dislodge the Germans and resulted in immense losses to the French in April and May, 1917; on May 15 he was relieved of his post as commander-in-chief. He was placed in command of the French forces in North Africa and held this position until 1919.

**NOGUCHI, HIDEYO** (1876- ). A Japanese-American pathologist (see Vol. XVII). Dr. Noguchi's most striking achievement after joining the staff of the Rockefeller Institute was the discovery of the microorganism causing yellow fever. (See YELLOW FEVER.) In 1923 he published *Laboratory Diagnosis of Syphilis*.

**NOLEN, JOHN** (1869- ). An American landscape architect and city planner, born at

Philadelphia, and educated at Pennsylvania, Munich, and Harvard Universities. From 1903 he was engaged in practice in Cambridge, Mass. His more important work includes the plans for the Agricultural School and Smith College at Northampton, Mass., for public institutions for Wisconsin, and for many private houses. He drew comprehensive city plans and reports for the improvement of Roanoke, Va., Sacramento, Cal., and many other cities. During the War he was a member of the advisory housing committee of the Emergency Fleet Corporation and was consultant and designer for several towns for the United States Housing Corporation. His many writings on architectural subjects include *Madison, a Model City* (1910), and *New Ideals in the Planning of Cities, Towns, and Villages* (1919).

**NORDAU, MAX SIMON** (1849-1923). A Jewish author of Hungarian birth (see VOL. XVII). His reputation rests on his *Degeneration* (1895), which overshadowed all his subsequent works. He was a resident of Paris and died there. His last publications were *Menschen und Menschliches von Heute* (1915) and *Französische Staatsmänner* (1916). He remained an ardent Zionist.

**NORDEN, N. LINDSAY** (1887- ). An American organist and composer, born in Philadelphia. He received his musical training in New York under M. Spicker, F. W. Robinson, A. Weld, and later, at Columbia University, under Prof. C. Rybner. From 1905 to 1909 he was musical director at St. Mary's, and from 1909 to 1917, at All Saints' in Brooklyn. In 1917 he was appointed W. W. Gilchrist's successor as conductor of the Mendelssohn Club in Philadelphia, where he settled permanently the following year as organist and choirmaster at the Second Presbyterian Church, choirmaster at St. Paul's, and teacher at the Delancey School. In 1920 he became conductor of the Reading Choral Society, producing oratorios and choral works in the larger forms. Having become interested in the a cappella music of the Russian liturgy, of which he made a special study, he organized in 1912 the Æolian Choir of 60 trained voices, which he conducted until 1917, introducing to concert audiences works never heard in the United States outside the regular service in some of the larger Russian churches. This pioneer work he continued in Philadelphia with his choir of the Second Presbyterian Church. He edited a large collection of this music, about 80 numbers, with English translation. His original compositions include an overture, *King Melville*; an orchestral sketch, *Silver Plume*; a cantata, *Thanatopsis*; many motets, anthems, and services and songs.

**NORDENSKIÖLD, NILS ERLAND HERBERT, BARON** (1877- ). A Swedish anthropologist (see VOL. XVII). He wrote *Forskningar och Avenyr i Sydamerika* (1915); *An Ethnogeographic Analysis of the Material Culture of Two Indian Tribes in the Gran Chaco* (1919); *The Changes in the Material Culture of Two Indian Tribes under the Influence of New Surroundings* (1920); *The Copper and Bronze Ages in South America* (1921); *Deductions Suggested by the Geographical Distribution of Some Post-Columbian Words Used by the Indians of South America* (1922), and, in German, *Indianer und Weisse in Nord Ost Bolivien* (1922), and *Traumsagen aus den Anden* (1922).

**NORDEN SOCIETY.** See NORWAY, *History*.

**NORDIC.** See RACE PROBLEMS.

**NOREEN, ADOLF GOTTHARD** (1854- ). A Swedish philologist of high reputation, many of whose works have been translated (see VOL. XVII). Since his book on Swedish names of places, he has published other works including an edition of Marcus Borgström's *Svenska Sprakets Historia for Folkskoleseminarier* (1916).

**NORFOLK.** A port of entry for Virginia and the second port on the Atlantic coast in volume of exports. The population increased 71.6 per cent from 67,452 in 1910 to 115,777 in 1920 and to 164,105 by estimate of the Bureau of the Census for 1924. During the War the Federal government built an army base terminal at a cost of \$29,000,000, which was afterwards leased and operated by the city. In 1918, the commission-manager type of government was adopted; city planning and zoning were established. A new \$5,000,000 water system, adequate for a city of 1,000,000 population, was procured, two junior high schools and an industrial high school for negroes were built at a cost of \$500,000 apiece, and 15 playgrounds were established and equipped. A municipal grain elevator and terminal of eight warehouses was built in 1923 at a cost of \$5,000,000, and a municipal market was completed in the same year. Private building operations amounted to \$5,368,971 in 1923, an increase of 110 per cent in 10 years; bank clearings to \$417,592,524, an increase of 94 per cent, and the city budget to \$7,234,148, an increase of 428 per cent. The total annual value of port commerce increased more than 800 per cent during the same period.

**NORFOLK ISLAND.** See PACIFIC OCEAN ISLANDS.

**NORMAL COLLEGE OF THE CITY OF NEW YORK.** See HUNTER COLLEGE.

**NORRIS, GEORGE WILLIAM** (1861- ). American legislator (see VOL. XVI). He was reelected to the United States Senate in 1918. He was one of the most prominent leaders of the so-called Progressive wing of the Republican party in the Senate and formed one of the "agricultural bloc." He was a candidate for reelection in 1924.

**NORRIS, JAMES FLACK** (1871- ). An American chemist, born at Baltimore, Md., and educated at Johns Hopkins University. During 1895-1904 he was connected with the chemical department of the Massachusetts Institute of Technology and in 1904 became professor of chemistry at Simmons College, but in 1915 he accepted a call to Vanderbilt University, where he remained a year. He returned to the Institute of Technology and in 1920 became professor of organic chemistry there. He lectured on his specialty at Harvard (1912-14) and Clark University (1913-14). His original investigations have been chiefly in organic chemistry. He was an associate on the Naval Consulting Board in 1916 and during 1917-18 was connected with the gas defense work of the Bureau of Mines. He served later in the Chemical Warfare Service, with the rank of lieutenant-colonel, and inspected the war gas factories of Germany. Dr. Norris is the author of *The Principles of Organic Chemistry*, *Experimental Organic Chemistry*, and a *Textbook of Inorganic Chemistry*.

**NORRIS, KATHLEEN (THOMPSON)** (1880- ). An American novelist (see VOL. XVII). Among her later books are *The Treasure*

(1915); *The Story of Julia Page* (1915); *The Heart of Rachel* (1916); *Undertow* (1917); *Martie, the Unconquered* (1917); *Josslyn's Wife* (1918); *Sisters* (1919); *Harriet and the Piper* (1920); *The Beloved Woman* (1921); *Lucretia Lombard* (1922); *Certain People of Importance* (1922); *Butterfly* (1923); and *The Callahans and the Murphys* (1924).

**NORTH CAROLINA.** North Carolina is the twenty-seventh State in size (52,426 square miles), and the fourteenth in population; capital, Raleigh. The population increased from 2,206,287 to 2,559,123, a gain of 16 per cent. The white population increased from 1,500,511 to 1,783,779; negro, from 697,843 to 763,407; native white, from 1,494,569 to 1,776,680; foreign-born (a very small proportion of the population), from 5942 to 7099. Both urban and rural populations increased during the decade: the former from 318,474 to 490,370; the latter from 1,887,813 to 2,068,753. The growth of the principal cities was as follows: Winston-Salem, 22,700 (1910), to 48,395 (1920); Charlotte, 34,014 to 46,338; Wilmington, 25,748 to 33,372; Asheville, 18,762 to 28,504.

**Agriculture.** As North Carolina is one of the cotton-producing States, it has been considerably affected by the advance of the boll weevil, which reached the State about 1920-21. The ravages of these insects, however, vary with the intensity of the winter (the cold killing many of them), so that while there was serious destruction in some sections, the effect on production was not as marked as it was farther South. The acreage planted to cotton in 1913 was 1,576,000 and the production 792,000 bales; in 1915, 1,282,000, 699,000 bales; in 1918, 1,600,000 and 898,000; in 1920, 1,587,000 and 925,000; in 1922, 1,626,000 and 852,000. The estimated production in 1923 was 877,000 bales. See COTTON; also BOLL WEEVIL.

While the population of the State increased 16 per cent in the decade 1910-20, the number of farms increased 6.3 per cent (from 253,725 to 269,763). The acreage of land in farms, however, showed a decrease of 10.8 per cent, or from 22,439,129 to 20,021,736; and the improved land in farms decreased 7 per cent, from 8,813,056 to 8,198,409 acres. The total value of farm property showed an apparent increase of 132.5 per cent in the decade, or from \$537,716,210 to \$1,250,166,995; the average value per farm, from \$2119 to \$4634. In interpreting these values and all comparative values in the decade 1914-24, the inflation of currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 269,763 farms in 1920, 151,376 were operated by owners, 928 by managers, and 117,459 by tenants. The corresponding figures for 1910 were 145,320, 1118, and 107,287. White farmers in 1920 numbered 193,473, compared with 188,069 in 1910; colored farmers, almost entirely negroes, numbered 76,290, compared with 65,656. Farms free from mortgage in 1920 numbered 102,950, and those under mortgage, 24,499; in 1910, 117,028 were free from mortgage and 26,642 were mortgaged. The total number of cattle in 1920 was 644,779, of which 462,077 were dairy cattle; in 1910 the total number was 700,861 (308,914 dairy cattle). Sheep, in 1920, numbered 90,556, compared with 214,473 in 1910; hogs, 1,271,270, compared with 1,227,625. The estimated pro-

duction of the principal farm crops in 1923 was as follows: corn, 54,405,000 bushels; wheat, 6,038,000 bushels; oats, 3,828,000 bushels; potatoes, 3,861,000 bushels; sweet potatoes, 10,126,000 bushels; tobacco, 355,266,000 pounds; hay, 657,000 tons. Comparative figures for 1913 are: corn, 55,282,000 bushels; wheat, 7,078,000; oats, 4,485,000; potatoes, 2,400,000; tobacco, 167,500,000 pounds.

**Manufactures.** While North Carolina is not one of the leading manufacturing States, it has great industrial importance. In 1920, there were 14 cities of more than 10,000 inhabitants, which formed 12.1 per cent of the total population; and in 1919 these reported 42.2 per cent of the value of the State's manufacturing products. There were in the State 4931 manufacturing establishments in 1909; 5507 in 1914; and 5999 in 1919. Persons engaged in manufacture numbered 133,453, 151,335, and 175,423; and the capital invested amounted to \$217,185,588, \$253,841,808, and \$669,144,096, in those years. The value of the product in 1909 was \$216,656,055; in 1914, \$289,411,987; and in 1919, \$943,807,949. The large increase in value of products was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the census period, 1914-1919; but the increase in number of persons engaged in manufacture clearly indicates steady growth in the manufacturing importance of the State. The manufacture of cotton ranks first in point of value of product: in 1909, \$72,680,000; 1914, \$90,744,000; and 1919, \$318,368,000. The manufacture of tobacco, cigars and cigarettes ranks second in this respect, valued in 1909 at \$35,987,000; 1914, \$57,861,000; and 1919, \$259,824,000. Lumber and timber products, third in value, amounted to \$33,525,000 in 1909; \$39,632,000 in 1914; and \$69,580,000 in 1919. The manufacture of cotton-seed oil and cake, next in order, had a product valued at \$8,504,000 in 1909; \$15,269,000 in 1914; and \$46,995,000 in 1919. The chief manufacturing cities of the State are Winston-Salem, Durham and Charlotte. In Winston-Salem, there were 66 manufacturing establishments in 1909, with a product valued at \$18,240,000; 73 in 1914, with \$37,288,000; and 93 in 1919, with \$200,485,000. Durham had 60 manufacturing establishments in 1909, with a product valued at \$23,027,000; 62 in 1914, with \$27,597,000; and 74 in 1919, with \$70,659,000. Similar figures for Charlotte were: 108 in 1909, with \$10,460,000; 107 in 1914, with \$10,962,000; and 111 in 1919, with \$43,096,000. Other important manufacturing cities are Greensboro, Raleigh, New Bern, Wilmington and Asheville.

**Education.** The educational problems in North Carolina are those of the other southern States that have a large colored population. During the decade 1914-24, steady progress was made. Schools were reorganized in 1919 and provision was made for a State Equalizing Fund, the purpose of which is to distribute as equally as possible the burden of supporting the county schools; the General Assembly had been setting apart a fund for this purpose for several years. The General Assembly of 1921 inaugurated a greatly improved tax system, which renders easier the raising of money for educational purposes. There was being developed in the State a system of public schools with the county as the unit of administration, in

contrast to a tendency in former years for the county to break up into small districts chartered by the General Assembly and made independent of the county authorities. The decision of the courts and legislative acts during the decade tended to make the county the unit and to bring all the small local tax or special charter districts under county control, giving to the county board of education very broad powers. The growth of the community high school was remarkable, especially in the last three years of the decade, the county districts being given as good high-school advantages as the towns and cities. Vocational training in agriculture and home economics was carried on in the public schools, having been made possible through acceptance of the provision of the Federal act that appropriates Federal funds to the States for this purpose. The Legislature of 1921 created a Division of Negro Education, which was given general charge of the supervision of Negro schools in the State, and will undoubtedly result in great improvement in the schools. The school enrollment increased from 520,404 in 1910 to 752,698 in 1922; in the public high schools from 14,407 to 48,831. The total expenditure increased from \$3,178,950 to \$21,649,695. The percentage of illiteracy in the State decreased from 22.6 in 1910 to 16.9 in 1920: among the native white population from 15 to 10.7; among the foreign-born, from 8.1 to 7; among the negro, from 24.2 to 18.9.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** North Carolina, in the decade 1914-24, remained steadily Democratic. In 1914 elections were held for United States Senator; Senator Overman was reelected. Democratic Representatives were elected to all districts except one. In 1916 elections were held for governor and State officers. Thomas W. Bickett, nominated by the Democrats, was elected over the Republican nominee, Frank W. Linney. In the presidential voting, President Wilson received 168,383 votes; Charles E. Hughes, 120,890. In 1918 elections were held for United States Senator and for other officers. Senator Simmons was reelected. Cameron Morrison, Democratic candidate, was elected governor in 1920, and Lee S. Overman was reelected to the Senate. In the presidential voting of this year, J. M. Cox received 305,447 votes; and W. G. Harding, 232,848. The voters in 1922 rejected a proposed amendment to the constitution to increase the pay of members of the Legislature from \$4 to \$10 a day. Minor State officers were chosen at this election.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. In 1915 a proposed woman suffrage amendment was defeated in the House by a vote of 67 to 32. Bills designed to bring about an enforcement of the law against child labor also failed to pass. Measures regulating the sale of liquor in the State were enacted. In 1917 the Legislature amended the laws relating to criminal procedure, created a budget system, and provided for the voting of citizens absent in the national service. A commission was appointed to make a survey of the educational system. In 1919 the Legislature adopted the Federal prohibition amendment, on January 4. This Legislature also enacted measures forbidding child labor and passed an act requiring compulsory school attendance for children under 14 years of age. In the session of 1921

the banking institutions of the State were regulated, and provision was made for their more thorough supervision. Laws relating to attempted bribery were amended, and measures were passed for the promotion of coöperative marketing of farm products. A provision was also made for a State system of roads and for the development of agriculture and industry. The Legislature also made provision for the issue of bonds to enlarge and improve the educational and charitable institutions of the State. In 1923 a measure was passed by the Legislature creating a board to supervise the taxes of the State. A prohibition law was repealed and a law substituted providing prohibition against the transportation, manufacture, or sale of liquors containing more than .5 per cent alcohol. At this session was also created a system of mothers' pensions.

**NORTH CAROLINA, UNIVERSITY OF.** A State institution at Chapel Hill, N. C., founded in 1795. The university expanded considerably between 1914 and 1923-24, with a faculty of 85 and an enrollment of 981 in the former year as compared with a faculty of 165 and an enrollment of 2130 in the year 1923-24 and 1817 in the summer of 1923. The library was also increased during the decade from 75,000 to 119,625 volumes; and the income was increased from \$170,000 to \$927,774.25, of which \$75,000 annually comes from the bequest of Mrs. Robert W. Bingham received in 1917 and \$40,000 from the gift of the General Education Board in 1920. Four new dormitories and three class buildings were put up between 1921 and 1923, and State funds were available in 1923-25 for four other dormitories and a building for the department of chemistry. A Student Union was being erected in 1923 from alumni subscription, and an Alumni Club from a private gift. Harry Woodburn Chase succeeded Edward K. Graham, who died in 1918, as president.

**NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH, First Viscount** (1865-1922). A British newspaper publisher (see VOL. XVII). His activities at the outbreak and during the course of the War were in many cases highly effective. He was strongly opposed to the administration of Lord Kitchener and was instrumental in bringing about his removal. Through his efforts also, the munitions department was placed on an efficient basis. He was an ardent supporter of Lloyd George and had much to do with the latter's accession to the premiership. In 1917 he was appointed director of the Civil Aerial Transport Committee and chairman of the British War Mission to the United States; in the following year he was director of propaganda in the enemy countries. For his services during the War, he was created viscount in 1917. He died after a long siege of ill health on Aug. 14, 1922. He published several books, including one of his experiences at the front during the War.

**NORTH DAKOTA.** North Dakota is the sixteenth State in size (70,837 square miles), and the thirty-sixth in population; capital, Bismarck. The population increased from 577,056 in 1910 to 646,872 in 1920, a gain of 12.1 per cent. The white population increased from 569,855 to 639,954, the native white increasing from 413,697 to 508,451. The number of Indians decreased from 6486 to 6254; negroes, from 617 to 467; foreign-born whites, from

156,158 to 131,503. Both urban and rural populations mounted, the former from 63,236 to 88,239; the latter from 513,820 to 558,633. The growth of the principal cities was as follows: Fargo, 14,331 (1910), to 21,961 (1920); Grand Forks, 12,478 to 14,010; Minot, 6188 to 10,476.

**Agriculture.** As North Dakota is one of the largest grain-producing States, agricultural conditions in the decade 1910-20 were affected by the fluctuations in price and production of wheat and other grains resulting from conditions during and following the War. An account of the general agricultural situation will be found under AGRICULTURE, CORN, WHEAT. While the population of the State showed a growth of 12.1 per cent in the decade, the number of farms increased 4.5 per cent (from 74,360 in 1910 to 77,690 in 1920); the total acreage in farms from 28,426,650 to 36,214,751, or 27.4 per cent; and the improved land in farms, from 20,455,092 acres to 24,563,178, or 20.1 per cent. The percentage of the total area used for agricultural purposes increased from 63.3 in 1910 to 80.6 in 1920; the percentage of farm land improved decreased from 72 per cent to 67.8. The total value of farm property showed an apparent increase, from \$974,814,205 in 1910 to \$1,759,742,995 in 1920, or 80.5 per cent; the average value per farm, from \$13,109 to \$22,651. In interpreting these values, and all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 77,690 farms in 1920, 56,917 were operated by owners, 855 by managers, and 19,918 by tenants. The comparative figures for 1910 were 63,212, 484, and 10,664. White farmers in 1920 numbered 77,147, of whom 40,899 were native, and 36,248 foreign-born. In 1910, there were 73,617 white farmers; 35,750 native, and 37,867 foreign-born. In 1920, the colored farmers numbered 543, of whom 517 were Indians; in 1910, there were 743, of whom 721 were Indians. Farms free from mortgage in 1920 numbered 12,833, compared with 30,651 in 1910; those under mortgage, 40,462, compared with 31,727 in 1910—a reflection of the unfavorable agricultural condition after the War. The number of dairy cows in 1920 was 461,093, compared with 259,173 in 1910, indicating the development of dairy farming. The number of "beef cows" was 296,135, compared with 119,510; and the number of sheep increased from 241,392 to 298,912. The estimated production of the principal farm crops in 1923 was as follows: corn, 21,457,000 bushels; spring wheat, 62,352,000 bushels; oats, 57,950,000 bushels; rye, 10,046,000 bushels; barley, 22,783,000 bushels; potatoes, 12,764,000 bushels; hay, 1,450,000 tons, and flaxseed, 9,259,000 bushels. Comparative figures for 1913 are: corn, 10,800,000 bushels; wheat, 78,855,000; oats, 57,825,000; rye, 1,800,000; barley, 25,500,000; potatoes, 5,100,000; and hay, 388,000 tons.

**Manufactures.** North Dakota is not a State of great industrial importance. There were three cities in 1920 having more than 10,000 inhabitants. These formed 7.2 per cent of the total population in 1920, and reported 33.3 per cent of the value of the State's manufactured products in 1919. There were in the State 752 manufacturing establishments in 1909; 699 in 1914; and 894 in 1919. Persons engaged in

manufacture numbered 4148, 4627, and 6148; and the capital invested amounted to \$11,584,747, \$14,213,362, and \$24,548,833, in those years. The value of the manufactured products amounted to \$19,137,506 in 1909; \$21,147,431 in 1914; and \$57,373,622 in 1919. The large increase in value of products is due largely to the change in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures between the industrial censuses of 1914 and 1919; but the increase in number of wage earners and in number of establishments is clear evidence of growth in the manufacturing activities of the State. The most important industry in point of value of product is flour and gristmilling. This, in 1909, amounted to \$11,685,000; in 1914, to \$12,030,000; and in 1919, to \$29,282,000. The manufacture of butter ranks second in this respect, valued, in 1909, at \$1,029,000; in 1914, \$1,740,000; and in 1919, \$11,122,000. Printing and publishing, ranking third, had a product valued at \$1,910,000 in 1909; \$2,220,000 in 1914; and \$3,225,000 in 1919. Car construction and repair, in fourth place, had a product valued in 1909 at \$680,000; in 1914, \$1,235,000; and in 1919, \$3,183,000. The principal manufacturing cities are Fargo, Grand Forks and Minot.

**Education.** Education has been one of the chief concerns of the citizens and government of North Dakota from the beginning of its Statehood, and progress in educational matters accelerated during the decade 1914-24. During this period there was a rapid increase in the number of standardized rural schools and in the consolidated schools of the State. Two normal schools were established at Minot and Dickinson, respectively, and the normal school at Valley City became the State Teachers College, granting a bachelor's degree. During the last few years of the decade a campaign against illiteracy was in progress. The legislative session of 1923 granted an appropriation for Americanization work which made it possible for the department to appoint a State director for adult education. The State was entering upon what was practically a period of reconstruction in education, and a new State education programme was being undertaken. The total enrollment in the public schools increased from 139,802 in 1910 to 168,446 in 1920. The total enrollment in the high schools in 1920 was 15,062. Total expenditure for education increased from \$4,829,232 in 1910 to \$13,306,724 in 1920. The percentage of illiteracy in the State decreased from 3.7 per cent in 1910 to 2.9 per cent in 1920: among the native white population, from 0.4 to 0.3; among the foreign-born white, from 5 to 4.9; and among the negro, from 6.8 to 6.7.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** The decade 1914-24 was notable in the political history of the State in that it marked the rise of the Non-Partisan League to a position of control, which brought about practically a Socialist form of government. Elections were held in 1914 for governor and United States Senator. L. B. Hanna, Republican, was elected governor and A. J. Gronna was reelected Senator. The Non-Partisan League, an organization composed chiefly of farmers, and founded largely through the efforts of A. C. Townley, Socialist, had, by 1916, gained such strength that it was able to control the political situation. The success of

the League was due chiefly to a breach in the Republican party, which divided into factions, and partly to a prolonged newspaper agitation and conditions among the farmers which made the situation ripe for a political overturn. The League advocated the ownership by farmers of terminal elevators, banks and other facilities for marketing their crops. The State-wide primaries in June, 1916, endorsed candidates of this party, and the State Republican organization came under its control. In the elections in November, the League elected its entire State ticket, including L. J. Frazier for governor. The League, however, supported Porter J. McCumber for reelection to the United States Senate. In the presidential voting of this year, President Wilson received 55,260 votes, and Charles E. Hughes, 53,471 votes. The League, having gained full control of all departments of the State government, planned an extensive series of measures, largely along State ownership lines, including the ownership by the State of terminal grain elevators, packing plants, banks, and other organizations. In 1918, Governor Frazier was reelected, together with the other State officers. At a referendum election held in 1919, the legislative programme of the Non-Partisan League (see *Legislation* below), was adopted. A. C. Townley, president of the League, was in 1919 found guilty under the State Sedition Law. The Non-Partisan League was continued in political power by the election, in 1920, of Governor Frazier, who was reelected. The Republican-Non-Partisan candidate for the Senate, E. F. Ladd, was elected, defeating Senator Gronna. As the result of the carrying out of the programme of the Non-Partisan League during this year, the financial system of the State became severely embarrassed. The League had established a State bank in which it was designed to compel the deposit of all public funds. This bank was to be the source of credit for carrying out their plans, and at one time it contained over \$30,000,000 in deposits. The people voted against the compulsory deposit of funds in the bank, and as a result there were withdrawn large amounts until the deposits amounted, in 1920, to only about \$10,000,000. In spite of the action of the State Industrial Commission forbidding counties and towns to withdraw funds, the situation became extremely embarrassing and the programme of the League was largely discontinued. A plan to finance industries by the issue of bonds amounting to \$17,000,000, failed. In the presidential voting of this year, W. G. Harding received 160,072 votes, and J. M. Cox, 37,422. Industrial and financial conditions continued to be bad in 1921, chiefly as a result of legislation passed in accordance with the programme of the Non-Partisan League. The government system of North Dakota provides for the recall of public officials, and by a vote of recall Governor Frazier, the Attorney General, and the Commissioner of Agriculture and Labor, were recalled. R. A. Nestos succeeded as governor. This action was a serious reverse to the Non-Partisan League. In the election of 1922, Governor Nestos was reelected, defeating the Non-Partisan candidate. Lynn J. Frazier, however, was elected to the Senate. The Non-Partisan League also elected a State Auditor and other State officials. At the election of November, 1922, the people adopted a soldiers' bonus measure. This was declared unconstitu-

tional by the State court on Feb. 10, 1923. Governor Nestos was inaugurated on Jan. 3, 1923. In his message he urged the revision of the system of taxation of the State and the curbing of expenditures. At presidential primary elections held early in 1924, President Coolidge received 50,539 votes, Senator La Follette, 37,052 votes, and Senator Johnson, 30,934 votes. William G. McAdoo was the unopposed Democratic nominee.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. In 1915, the Legislature abolished capital punishment. In 1917, the Non-Partisan League was in control of the Legislature and a great mass of legislation was introduced along lines advocated by that body. The judicial system of the State was amended. The Torrens system of registration of land titles was put into effect. A constitutional amendment was proposed creating a Hale Insurance Fund for the protection of farmers' crops. A special session of the Legislature was held in 1918. This authorized the county to issue bonds and loan money to farmers on their personal notes. At this session a Federal Prohibition Amendment was ratified. The Legislature of 1919 created an industrial commission and authorized it "to conduct and manage, on behalf of the State, certain utilities, industries, enterprises and business projects." This commission was composed of the Governor, Attorney General and other State officers. The State bank and banking system were also adopted and an issue of \$20,000,000 in bonds authorized for the establishment of the system. The Legislature also adopted an inheritance and income tax and created a State Board of Administration. Most of these measures were ratified by the people on June 22, 1919. The Legislature of 1919 also adopted an amendment authorizing the State to engage in any industry not specifically prohibited. In 1923, the Legislature passed a measure prohibiting expenditures of excessive appropriations. It passed measures regulating the use of liquor and increased the penalties for violation. It also enacted a measure forbidding the wearing of masks in public places with the intent to conceal the wearers' identity.

**NORTH DAKOTA, UNIVERSITY OF.** A co-educational State institution at University Station, Grand Forks, N. D., founded in 1883. The student enrollment increased from 740 in 1914 to 1351 in 1923-24 and 445 in the summer of 1923. The faculty was increased during the same period from 80 to 109 members, and the library from 55,000 to 80,000 volumes. A chemistry building and an armory were completed in 1919 and a Law School building was opened in 1923. Frank Le Rond McVey, Ph.D., resigned from the presidency in 1917 and was succeeded by Thomas F. Kane, Ph.D., LL.D.

**NORTHERN EPIRUS.** See *EPIRUS, NORTHERN*.

**NORTHERN TERRITORY.** A territory of the Commonwealth of Australia, situated in the central and northern part of the continent. Area, 523,620 square miles; population, exclusive of aborigines, in 1911, 3310; in 1922, 3554. Occupation proceeded slowly; only 747 square miles had been alienated by 1921. Mineral production steadily declined so that by 1921-22 only £9908 in all was the value of the total yield (£55,299 in 1912). The trade records made a

similar showing: imports and exports for 1913, £20,977 and £67,911; for 1921-22, £12,115 and £5036. Revenues and expenditures over the period were: for 1913-14, £73,657 and £532,535; for 1921-1922, £71,239 and £289,062. Expenditures up to 1921 were heavy because of the Port Augusta Railway project. Up to June 30, 1922, the public debt, a charge on the Commonwealth, was £3,951,746. The policy of the government was to dispose of the lands by leasehold only.

**NORTH POLE.** See POLAR RESEARCH.

**NORTH SCHLESWIG.** See SCHLESWIG.

**NORTH SHORE MUSIC FESTIVAL.** See MUSIC, *Festivals*.

**NORTHWEST TERRITORIES.** The name of the unorganized territories (Franklin, Keewatin, and Mackenzie) of the Dominion of Canada, with an area of 1,242,224 square miles, and a population in 1911 of 6507 and in 1921 of 7988. Agriculture was carried on to a small extent only, because of the short summer season, but vegetable gardening was successful when tried, e.g. at Fort Resolution, Fort Smith, Fort Vermilion, and the Roman Catholic Mission at Salt Plain. With the discovery of oil at Fort Norman in 1920, interest in the territories quickened. Other minerals were known to exist, although up to 1924 they were little worked. There were lead and zinc ores on the south side of the Great Slave Lake; gold in the Liard and Peel Rivers; and gypsum, salt, and coal, in considerable quantities. The lake fisheries and forest wealth were still inadequately explored; furs made up 40 per cent of the total Canadian output. The government was carried on under the direction of a commissioner assisted by a deputy commissioner and a council of five.

**NORTHWESTERN COLLEGE.** A coeducational institution at Naperville, Ill., supported by the Evangelical Church but nonsectarian in its requirements; founded in 1861. The student enrollment and the number of members of the faculty increased steadily from 291 students and 29 instructors in 1916 to 502 students and 40 instructors in the year 1923-24. The library was increased from 12,500 volumes to 16,000 volumes in the same period. In 1921, the college received an addition of \$500,000 to its endowment, and \$250,000 for building purposes, from the Forward Movement Campaign of the Evangelical Association, and in 1923 an addition of 41 acres was made to the campus through other gifts. President, Edward Everett Rall, Ph.D.

**NORTHWESTERN UNIVERSITY.** A coeducational university composed of the College of Liberal Arts, College of Engineering, School of Music, School of Speech, School of Commerce, and the Medill School of Journalism, the Graduate School of Arts and Sciences, and the School of Education at Evanston, Ill.; the Dental School, Law School and part-time classes of the School of Commerce and the Medill School of Journalism at 31 West Lake Street, Chicago, and the Medical School at 2421 South Dearborn Street, Chicago. The College of Liberal Arts, the oldest school of the university, was founded in 1851. In 1923-24, the enrollment of the university was estimated at 9925, including the summer session and about 4000 students in the Chicago part-time courses in commerce and journalism. In 1914, the corresponding enrollment was 4138. The faculty in 1923-24, exclud-

ing the summer session lecturers, was 590 as contrasted with 450 in 1914. Walter Dill Scott, Ph.D., LL.D., was elected president in 1920 to succeed Lynn Harold Hough, LL.D., resigned.

**NORTON, CHARLES DYER** (1871- ). An American banker, born at Oshkosh, Wis., and educated at Amherst College. For several years he was engaged in magazine and insurance work. In 1909-10 he was assistant secretary of the United States Treasury, and from 1910 to 1911, secretary to President Taft. He was in 1911 elected vice president of the First National Bank of New York City and in 1918 became president of the First Security Company. He was an official in many other corporations and a trustee of the Metropolitan Museum of Art, the American Academy in Rome, the American Federation of Arts, the Russell Sage Foundation, etc.

**NORTON, THOMAS HERBERT** (1851- ). An American consul and chemist (see VOL. XVII). From 1915 to 1917 he was detailed by the Department of Commerce to further the development of American chemical industries, especially dyestuffs. From 1917 to 1920 he was chemist with E. I. du Pont de Nemours and Co. From 1917 to 1918 he edited *The Chemical Engineer*, and in 1920 he became editor of *The Chemical Color and Oil Daily*. Among his later writings are *Dyestuffs for the American Textile Industry* (1915); *Cottonseed Industry in Foreign Countries* (1915); *The Dyestuff Census* (1916); and *Tanning Materials of Latin America* (1917).

**NORWAY.** A kingdom in northern Europe with a total area of 124,964.3 square miles. Its population in 1920 was 2,649,775, of which the urban numbered 785,404. Chief cities were: Christiania, 258,483 (1910, 241,834); Bergen, 91,443 (1910, 84,330); Trondhjem, 55,030 (1910, 45,335); and Stavanger, 43,778 (1910, 37,261). The total population in 1910 was 2,391,782, of which 713,262 was urban.

**Agriculture.** Total area of land under cultivation was 9823 square kilometers, of which 2825 was natural meadow; total forest area, 71,055 square kilometers; unproductive land, 217,643 square kilometers. The following indicates the production of principal crops in metric tons for 1912 and 1923.

| Crop               | 1912      | 1923      |
|--------------------|-----------|-----------|
| Wheat .....        | 8,821     | 15,975    |
| Rye .....          | 24,697    | 18,847    |
| Barley .....       | 73,353    | 71,456    |
| Oats .....         | 198,483   | 116,112   |
| Mixed grains ..... | .....     | 11,288    |
| Potatoes .....     | 704,240   | 660,510   |
| Hay .....          | 3,129,768 | 2,015,820 |

The following compares live stock figures for 1907 and 1918.

|          | Horses  | Cattle    | Sheep   | Goats   | Hogs    |
|----------|---------|-----------|---------|---------|---------|
| 1907 ... | 170,325 | 1,027,520 | 991,211 | 222,717 | 163,467 |
| 1918 ... | 208,219 | 1,085,707 | 939,940 | 185,800 | 127,230 |

Foodstuffs for a value of 107,000,000 crowns were imported in 1922. Norway was dependent in large measure on imports of cereals and colonial produce, but, on the other hand, it exported animal and fish products to a large extent.

**Industries.** There was practically no domestic production of the nonmetallic minerals, but

coal was being mined quite extensively on the Island of Spitzbergen (q.v.) where production at full capacity, it was predicted, would be able to supply the greater part of Norwegian demands. Water power was abundant and was being greatly utilized; the quantity developed up to 1924 was approximately 1,400,000 turbine horse power. The chief mineral products were silver, copper, pyrites, iron ore, and nickel. In 1922, 3015 men were employed in the mining industry, and the total value of production was 20,677,000 crowns; the total output of all minerals was 683,588 metric tons. During 1923, 32 mining establishments employed 3400 workers. There were one silver smelting furnace, two electro steel furnaces, and three ferro-alloy furnaces in Norway during 1923. Norwegian forests and fisheries were the chief natural sources of wealth. The total value of fisheries during 1923 was 65,000,000 crowns. The total area covered with forests was estimated at 71,055 square kilometers; value of planed and unplanned, sawn and unsawn timber products exported in 1923 was 73,358,364 crowns.

**Transportation.** Length of state railways, 2850 kilometers; private railways, 437. Passengers carried by state railways: (1921) 24,222,677; private railways, 4,210,885. Volume of freight moved by state railways, 6,396,711 metric tons; by private railways, 609,370 metric tons.

**Ocean Shipping.** In 1923 vessels entering at Norwegian ports with cargo numbered 5824, with 3,192,407 net tons; in ballast, 2324 with 1,729,201 net tons. Vessels clearing from Norwegian ports with cargo numbered 6254 with 4,097,467 net tons; in ballast, 1966 with 898,441 net tons. The Norwegian merchant marine, on Dec. 31, 1923, included the following: sailing vessels, 92; gross tonnage, 126,325; steamers and motorships, 1679; gross tonnage, 2,388,748, including only ships measuring more than 100 gross tons. Gross earnings of merchant marine in 1922 reached 462,600,000 crowns. Norway did an extensive carrying trade all over the world. Its principal ports are Christiania, Bergen, Trondhjem, Narvik, Fredriksstad, and Haugesund.

**Foreign Trade.** Imports in 1923 were estimated at 1,350,000,000 crowns; exports, at 831,200,000. Of the 1923 exports domestic goods were valued at 791,400,000 crowns; reexports, at 21,000,000; ships sold abroad, at approximately 19,000,000. Exports of Norwegian articles for 1923, grouped according to chief divisions, were as follows:

|                                           | Crowns      |
|-------------------------------------------|-------------|
| Live stock .....                          | 1,097,437   |
| Animal and fish products .....            | 170,542,777 |
| Grains .....                              | 986,825     |
| Seeds and feedstuffs .....                | 5,018,510   |
| Fruits, vegetables .....                  | 336,802     |
| Groceries .....                           | 961,353     |
| Liquors, alcohol .....                    | 312,604     |
| Spinning materials .....                  | 1,917,582   |
| Yarn, thread, and rope .....              | 2,461,940   |
| Textiles .....                            | 2,611,169   |
| Hair, feathers, bone, horn products ..... | 23,962,468  |
| Manufactures thereof .....                | 226,812     |
| Lumber .....                              | 70,412,595  |
| Fats, oils, tar, rubber .....             | 65,799,176  |
| Manufactures thereof .....                | 1,634,651   |
| Finished timber products .....            | 2,945,769   |
| Dyes and paints .....                     | 2,096,795   |

The principal countries of origin and destination for 1922 were:

|                     | Imports from | Exports to  |
|---------------------|--------------|-------------|
|                     | Crowns       | Crowns      |
| Great Britain ..... | 294,372,200  | 231,716,418 |
| Germany .....       | 283,314,420  | 76,364,142  |
| Sweden .....        | 128,049,340  | 52,146,693  |
| Denmark .....       | 103,920,040  | 35,819,246  |
| Netherlands .....   | 58,594,370   | 14,272,282  |
| Belgium .....       | 36,463,640   | 24,805,706  |
| France .....        | 28,579,200   | 55,107,155  |
| United States ..... | 243,450,290  | 90,340,474  |

Imports of the more important articles of consumption for 1923 showed: meat and meat products, 19,000 tons; grain and flour, 495,000; dairy products, 6725; fruits, 46,800; sugar, 58,200; tobacco, 2573; wines and liquors, 880,000 litres in bottles; wines and liquors in barrels, 3990 tons. Exports were: fish, 307,000 tons; canned fish products, 21,388 tons; cod liver oil, 249,748 hectoliters; lumber, 900,626 cubic meters; wood products, 923,700 tons.

**Finance.** The national debt on May 31, 1923, stood at 1,570,000,000 crowns. The gold and silver stocks, on Dec. 31, 1923, totaled 147,300,000 crowns; the amount of paper currency outstanding, 384,800,000 crowns. The exchange, which at par is \$268 to the crown, stood at 6.83 crowns to \$1 on Dec. 31, 1923, and at 7.42 crowns on Mar. 18, 1924. Over the period, the cost of living steadily mounted, as revealed by the fact that, on the average for a family of five persons with an income of 1500 crowns per annum in 1914 as 100, the index stood at 283 in December, 1921. On Feb. 15, 1924, it was 234.

**History.** Norway during the War showed the unsettled condition prevalent in all neutral countries. Norwegians were naturally averse to all participation in the conflict. And yet, because of the many ties that bound the whole western world together, economically, socially, and intellectually, it was inevitable that Norway should feel the weight of war profoundly. The policy of the Scandinavian countries gravitated toward the same end. By the end of August, 1914, the three countries had declared their neutrality; on December 19, agreements were definitely made by which all three pledged themselves to common action in the observance of this neutrality. Throughout the War these conferences continued, with the result that the northern peoples were more firmly drawn together than ever before. The amity with which events were discussed made a pleasant picture against the dark background of the turbulent

\* Not including ships sold abroad.

nationalistic aspirations of the rest of the European peoples. In fact, the movement thus started for the closer union of the Scandinavian populations soon reached an articulate form in the creation of the Norden Society in 1919. A Norwegian branch was opened on Apr. 12, 1919, an active publicity campaign was kept up, and year books were published. During the War extraordinary measures were necessary to shelter Norway's population as far as possible from the rigors of the hostilities. In November, 1914, a loan of \$4,000,000 was voted to cover extraordinary military expenses, and the government tried to push the construction of the two warships then on the ways in English shipyards. A commission was created to regulate the importation and distribution of foodstuffs, and the fixing of prices was likewise established. Because of the setting up of the British blockade in 1914 and the restriction of shipping to a circumscribed area about Scandinavia, Norway's contact with the outside world, on which it depended so much for the continuance of its daily activities, was greatly hampered, and widespread distress ensued. Shipping suffered severely. In all, as a result of torpedoing and mines, 830 ships with a tonnage of 1,238,300 were lost, and about 2000 sailors were drowned. Yet in spite of difficulties that continuously increased, Norwegian sailors refused to be driven from the high seas and maintained their intercourse with countries at war, Great Britain in particular. As foodstuffs became scarce, prices naturally rose and labor unrest increased. In 1916, demonstrations and strikes for the increase of wages involved almost 150,000 workmen, with the result that the Storthing forced through a measure for compulsory arbitration. After the War, the return to regular conditions was slow. Norwegian workmen manifested a great interest in communist doctrines, and in 1919 and 1920 strikes, particularly on the railways, were frequent. Labor circles regarded sympathetically the attempts of Soviet Russia to open commercial relations in September, 1920, but the Norwegian government at first refused to take the step. In 1921 a commercial treaty was effected which granted Russia surprisingly liberal terms, and in March, 1924, *de jure* recognition was accorded. The Norwegian government even refused to press the claims of its nationals in Russia, which amounted to some 300,000,000 crowns. Other matters of national interest after the War were the appointment of a royal commission in 1920, after much agitation, for the consideration of the creation of industrial works councils; the passage by the Storthing in 1921 of a measure tantamount to limited prohibition, which forbade the importation of liquors having more than a 14 per cent alcohol content (in 1924 there was talk of repealing this measure); and the passage of a ship subsidy measure in 1922 which set aside 25,000,000 crowns for government aid. In 1922, the permanent Court of Arbitration at The Hague awarded \$12,000,000 to Norway against the United States for the seizure of Norwegian ships in America's ports during the War. For Norway's claims to Spitzbergen, see SPITZBERGEN. Another international dispute which appeared well on the road to settlement, during the period, was the controversy with Denmark over the sovereignty of Greenland. In 1924 a convention was laid before the Norwegian Storthing and the Danish Rigsdag; it provided for an

amicable understanding on important economic matters. See also BEAR ISLAND; JAN MAYEN; NAVIES OF THE WORLD.

**NORWEGIAN LITERATURE.** See SCANDINAVIAN LITERATURE.

**NOTRE DAME, UNIVERSITY OF.** A Roman Catholic institution for men, at Notre Dame, Ind., founded in 1842. The university increased its student enrollment from 1077 in 1913 to 1900 in the year 1923-24, and 738 in the summer of 1923; its faculty, during the same period, from 84 to 130, and its library from 65,000 to 105,000 volumes. A library was built in 1916, a chemistry laboratory in 1917, a Law College building in 1918, and two halls for freshmen and sophomores, in 1923. Gifts amounting to \$645,000 were received in 1921. Rev. John Cavanaugh, C.S.C., was president until 1919, Rev. James A. Burns, C.S.C., Ph.D., 1919-22, Rev. Matthew J. Walsh, C.S.C., Ph.D., 1922-.

**NOURISHMENT.** See FOOD AND NUTRITION.

**NOVÃES, GUIOMAR (1895- ).** A Brazilian pianist, born at Joao de Boa Vista. At the age of four she began to play by ear, and it was not until she was seven that she received regular lessons from Chifarelli in São Paulo. Her progress was so rapid that after only two years of instruction she was exhibited as an infant prodigy, making frequent appearances, but at the same time continuing to work systematically. In 1909 she won a scholarship at the Paris Conservatoire, where she remained two years under I. Philipp and graduated as winner of the first prize. After her highly successful debut in Paris (1911), she made tours of France, Germany, England, Italy, and Switzerland until 1913. During the next two years she concertized in Brazil and then appeared for the first time in the United States (New York, Nov. 11, 1915), where she won instantaneous and emphatic success. She later made several American tours. She married Ottavio Pinto in 1922.

**NOVA SCOTIA.** A Canadian maritime province with an area of 21,428 square miles. The population in 1911 was 492,338; in 1921, 523,837, which represented a gain of 6.4 per cent. Of the population in 1921, 56.7 per cent was rural as compared with 62.2 per cent in 1911. The leading cities, with their populations in 1921, were: Halifax, 58,372 (46,619 in 1911); Sydney, 22,545 (17,723 in 1911); Glace Bay, 17,007; Dartmouth, 7899; Amherst, 9998; New Glasgow, 8974; Sydney Mines, 8327; Truro, 7562. Cape Breton Island is an integral part of the province.

**Industry.** Agriculture remained the leading activity. The geographical situation of the province favored, as always, the cultivation of hay, and in 1923, 890,200 tons were cut. Other important crops were potatoes, oats, and wheat. The production of apples steadily increased so that by 1922 the yield was valued at \$7,851,185, against the 1913 crop of \$2,000,000; the 1922 crop was 1,891,852 barrels; the 1923 crop, 1,500,000 barrels. The growth of fodder crops and the presence of an important live stock industry made dairying particularly important. Butter production increased tenfold over the period 1911-21. The value of live stock products was put at \$2,080,000 in 1923; wool was important. Agricultural products, in all, yielded \$40,613,000 in 1923. Lumbering continued to be important. Forest products totaled \$11,-

180,000 in 1922. Fisheries continued to absorb the attention of a considerable part of the population. Cod, lobsters, haddock, and mackerel comprised 83 per cent of the 1922 catch, with a total value of \$10,207,444, as against \$7,384,055 in 1913. In this 19,495 men were engaged, and the whole industry represented a capital of \$8,760,000; 4380 men worked in the canneries, which had a total capitalization of \$3,801,700. Bituminous coal was far and away the most important mineral. The output in 1922 was 5,569,072 tons, valued at \$24,629,921, and was distributed largely among the other maritime provinces. Gold continued to decline; the 1922 yield was only \$21,540 as against \$44,935 in 1913. Pig iron also showed decreases for the years following 1913. In all, in 1922, Nova Scotia's mineral products were valued at \$25,923,499, almost 19 per cent of the total production; Ontario and British Columbia surpassed Nova Scotia. Of the 20 blast furnaces in Canada, 6 were located in Cape Breton and 2 in Nova Scotia. In 1921 there were 2196 industrial establishments (1480 in 1910) employing 17,206 workers and capitalized at \$107,490,242 (\$79,596,341 in 1910). The cost of materials was \$43,919,126 and the gross value of products \$84,215,822 (\$52,706,184 in 1910). The following industries were important: manufacture of coke, iron and still products (\$11,000,000 in 1922), shipbuilding, sugar refineries, boot and shoe works, etc.

**Trade and Communications.** Imports entered for consumption in 1922-23 were \$23,878,615 (\$20,753,369 in 1912-13); exports were \$46,290,133 (\$24,201,473 in 1912-13). In 1922 there were 1451 miles of railway as compared with 1360 in 1913. Some 18,000 miles of highways kept in good repair made intraprovincial communication easy. This was further facilitated by the numerous subsidized boats which plied along the shore.

**Government.** The suffrage was exercised by both sexes. Revenues in 1914 were \$1,885,000; in 1922, \$4,791,000. The Dominion subsidy continued to yield about \$636,000. Other sources were royalties on coal lands and other provincial properties, succession duties, etc. There was no direct taxation. Expenditures in 1913 and 1922 were \$2,098,893 and \$4,791,998. In the same period the debt grew from \$12,615,686 to \$22,616,000. For the year 1921-22, 114,229 pupils were enrolled at 2982 schools. Total cost of education was \$3,646,570 as compared with \$1,439,742 in 1913. The Province maintained a normal school and an agricultural school at Truro as well as the technical school at Halifax. The most important educational question of the period was the proposal to

unite the six most important universities in the Maritime Provinces into a single centre. Representation in Parliament: House of Commons, 16; Senate, 10.

**NUTRITION.** See FOOD AND NUTRITION.

**NUTS.** See HORTICULTURE.

**NYASALAND PROTECTORATE.** A British protectorate in southeastern Africa on the southern and western shores of Lake Nyasa. Area, 39,573 square miles; population (1921), 1,199,934 natives; 1486 Europeans; 563 Asiatics. In 1911 there were 766 Europeans and 481 Asiatics. The chief settlement, Blantyre in the Shire Highlands, had some 300 Europeans. In the Shire Highlands coffee was being cultivated, as well as tobacco, cotton, and tea. The crops showing the greatest advances over the period 1910-22 were tobacco and tea, while cotton and coffee fell behind. Tobacco exports in 1912-13 totaled 2,262,545 pounds; 1922, 6,330,808. Leading imports were cotton piece goods, rice and grain, sugar, and petroleum. Imports in 1913-14 were £208,711; 1921, £637,567; 1922, £522,119. Exports in 1913-14 were £266,089; 1921, £416,404; 1922, £442,164. The trade does not include specie or goods in transit. Of the exports, 99 per cent went to the United Kingdom; 55 per cent of the imports came from the United Kingdom and 20 per cent from British possessions. The following figures show the course of administrative charges: revenues for 1913-14 and for 1922, £124,849 and £259,117; expenditures for same years, £133,106 and £305,495. The large deficit in the later year was occasioned by the cost of famine relief measures. The public debt of the protectorate in 1922 was £306,328. To this must be added £3,000,000 borrowed from Great Britain to finance war campaigns in German East Africa. To bring the protectorate into ready communication with the Indian Ocean a railway from Chindio in Portuguese East Africa to Blantyre (174 miles) was constructed. In 1922 another line connecting Blantyre with Beira in Portuguese East Africa was opened. The extension of the railway system northward to Lake Nyasa, on which so much depended, was still only contemplated in 1923. The settlers were involved in the War because of the proximity of German East Africa. Most of the Europeans saw service as well as almost 200,000 natives in the rôle of carriers. The natives continued orderly except for a single uprising in 1915 which was speedily quelled.

**OAKLAND.** The third city of California. The population increased 44 per cent in 10 years, from 150,174 in 1910 to 216,261 in 1920 and to 240,086 by estimate of the Bureau of the Census for 1923. A \$5,000,000 bond issue was authorized by the voters in 1919 to be used in building three high schools and six junior high schools. Oakland joined with several neighboring cities in 1923 to purchase the East Bay Water Company and develop new sources of supply for the district. In the same year the city purchased a site on the shore of Lake Merritt on which to build a museum. Plans were under way in 1924 for spending \$8,000,000 in developing the water front. Building permits increased 396 per cent from \$5,817,905 in 1918 to \$27,500,000 in 1923, bank clearings 110 per cent, from \$335,334,421 to \$803,797,523, and the assessed valuation of the city 28 per cent, from \$150,000,000 to \$192,221,000.

**OATS.** Among the cereal crops in the United States oats is exceeded only by corn and wheat in acreage and value. The average annual production for the years 1914 to 1923, inclusive, was 1,334,675,000 bushels and, similarly, the annual production for the three leading States was 206,240,000 bushels for Iowa, 159,445,000 bushels for Illinois, and 119,212,000 bushels for Minnesota. During the World War there was a general increase in acreage and production in the United States, while in Europe the crop decreased and for a number of years did not regain its normal status. The United States Grain Standards Act required oats in inter-State commerce to be inspected by a licensed inspector and graded by him on the basis of official standards. According to these standards, effective since June 16, 1919, oats are classified for commercial purposes as white (including yellow), red, gray, and black oats. Each class is divided into four grades on the basis of condition and general appearance, test weight per bushel, sound oats, heat damage, wild oats, and mixtures of other classes of oats. In addition, there is a "sample grade" for oats too poor to come within the numerical grades. For the three years ending June 30, 1922, about 53 per cent of all classes fell into grade three and about 28 per cent into grade two. Consult *United States Department of Agriculture Year Book*, 1922.

**OBBER, MARGARETE** (1885- ). A German dramatic mezzo-soprano, born in Berlin. She studied there with Benno Stolzenberg and, later, Arthur Arndt, whom she married in 1910. After her debut at Frankfurt in 1906, as Azucena, she was engaged at the Stadttheater in Stettin, where her extraordinary voice and superior talent as an actress attracted the attention of Von Hülsen, who in 1907 engaged her for the Royal Opera in Berlin. Her American debut as Ortrud at the Metropolitan Opera House (Nov. 21, 1913) was one of the sensations of the

season. From 1913 to 1917 she divided her time between New York in the winter and Berlin in the summer and sang as guest in other principal German opera houses and in Amsterdam. When the Royal Opera became the Staatsoper in 1919, she was retained as one of the principal stars. Her interpretation of the great Wagner rôles and of the German Lieder is considered unexcelled.

**OBERLIN COLLEGE.** A nonsectarian, co-educational institution at Oberlin, Ohio, founded in 1833. There was only a slight variation in the enrollment of students during the decade 1914-24, since the college limited the attendance of students to the number that it could efficiently care for with its classrooms, laboratories, and dormitories. In 1922-23, the total enrollment was 1801. The faculty increased from 157 in 1913-14 to 185 in 1923-24. The library, which was said to be the largest college library in Ohio, numbered 241,000 bound volumes and 178,000 pamphlets. New buildings erected during the 10 years included an art building in memory of Dr. Dudley P. Allen, given by Mrs. Allen, and an administration building erected in memory of Gen. Jacob Dolson Cox. In November 1923, Oberlin entered upon a campaign for \$4,500,000 for new endowment and buildings. By Jan. 1, 1924, gifts and pledges were received for \$3,000,000, and it was expected that the remainder of the fund would be secured before the end of 1924. The largest contribution was the gift of \$500,000 by the General Education Board. Work was to begin in the spring of 1924 on a new college hospital. President, Henry Churchill King.

**OBREGÓN, ALVARO** (1880- ). A president of Mexico, born in the District of Alamos. For many years he was engaged in scientific farming and stock-raising on his large estates. He was an advocate of economic reforms, including the better education of Indians. In 1912 he began his military career by recruiting a force of Indians to assist President Madero. He manifested unusual military talent in this brief campaign. He was appointed colonel of the Sonora state militia, and after Diaz's military revolt in Mexico City he offered his force to the government of Sonora and was sent to Nogales, where he routed the garrison. Following a victory at Cananea he was made general of the division by Governor Carranza of Coahuila. After many victories, he captured Guadalajara on July 9, 1914, and entered Mexico City as a victor in the following August. In 1915 Obregon defeated Zapata in Pueblo and again occupied Mexico City. His most important victory was over Villa in Celaya, in April. In this battle he lost an arm. In 1920 he entered a successful revolt against Carranza and in the same year was elected president of the republic. For his negotiations with the United States in 1923-24 and for other events of his administration in Mexico, see MEXICO.

**O'BRIEN, EDWARD JOSEPH HARRINGTON** (1890- ). An American author and editor, born at Boston, Mass. He studied at Boston College and at Harvard and from 1912 to 1915 was editor of *The Poetry Journal*. In the year following he was editor of *Poet Lore*. He wrote *The Flowing of the Tide*, a play (1910); *White Fountains*, verse (1917); *The Bloody Fool* (1917); *Distant Music* (1921); and *Hard Sayings* (1922). He edited *The World's History at a Glance* (1913); *Poems of the Irish Revolutionary Brotherhood* (1917); and from 1915 edited annually *The Best Short Stories* and *The Best English Stories*. He also translated several books from the French and other languages.

**O'BRIEN, FREDERICK** (1869- ). An American writer, born in Baltimore, Md., and educated at the Jesuit College in Baltimore and the University of Maryland. At the age of 18 he went to sea and for many years thereafter traveled extensively. He was at various times connected with newspapers in New York, San Francisco, Manila, and Paris. During the War he was acting food administrator of California and chief of education. As a result of a sojourn in the islands of the South Seas, he wrote *White Shadows in the South Seas* (1919). This was immensely successful and was followed by *Mystic Isles of the South Seas* (1921) and *Atolls of the Sun* (1922).

**OBSTETRICS.** See ABORTION.

**OCCIDENTAL COLLEGE.** An institution at Los Angeles, Cal., founded in 1887 under Presbyterian auspices. The number of students increased from 311 in 1915 to 522 in 1923, the faculty from 25 to 47 members, the endowment from \$161,027 to \$363,722, and the annual income from \$49,782 to \$129,961. The Graduate School and the School of Education were founded in 1922. The women's gymnasium and the president's house were built in 1922; the library, an anonymous gift in memory of Mrs. Mary Norton Clapp, was completed in March, 1924, at a cost of \$150,000; plans were in preparation for the building of Orr Court, a women's building and residence court, the gift of William Mead Orr in memory of Bertha Harton Orr. A campaign for \$500,000 was completed in 1924, oversubscribed by \$150,000. President, Remsen D. Bird, D.D.

**OCEAN NAVIGATION.** See SHIPPING; SHIPBUILDING; NAVIGATION.

**OCEANOGRAPHY.** See EXPLORATION.

**OCHSNER, ALBERT JOHN** (1858- ) (see VOL. XVII). In 1916 he wrote the surgical section of Smithies's *Cancer of the Stomach*, and in 1917, assisted by Percy, he brought out a new edition of his work, *A New Clinical Surgery*, with the title *A New Manual of Surgery, Clinical and Military*. A large four-volume system of surgery edited by Ochsner, *Surgical Diagnosis and Treatment by American Authors*, was published in 1920. During the War he was a major of the Medical Reserve Corps.

**O'CONNOR, ANDREW** (1874- ). An American sculptor (see VOL. XVII). His recent important works include a fine "Soldier" Worcester, Mass.; "Serenity," part of the monument to General Thomas, Tarrytown, N. Y.; "Inspiration," St. Louis Museum, and especially a bronze Lincoln (Springfield, Ill.), which has caused much discussion.

**OFFICERS' TRAINING CAMPS.** See ARMIES AND ARMY ORGANIZATION.

**OGG, FREDERIC AUSTIN** (1878- ). An American educator, born at Solsberry, Ind., and educated at DePauw, Harvard, and Indiana Universities. From 1905 to 1913 he was a member of the faculty of the Boston University and Simmons College. In the latter year he was appointed associate professor at the University of Wisconsin, where from 1917 he was professor of political science. He wrote *The Opening of the Mississippi—A Struggle for Supremacy in the American Interior* (1904); *Social Progress in Contemporary Europe* (1912); *Life of Daniel Webster* (1914); *Economic Development of Modern Europe* (1917); *The Old Northwest and Reign of Andrew Jackson* (in *Chronicles of America*, vols. xix and xx; 1919); *National Governments and the World War*, with C. A. Beard (1919); and *Introduction to American Government*, with P. O. Ray (1921). He was editor of *The Century Political Science Series*.

**O'HIGGINS, HARVEY J.** (1876- ). An American writer, born in London, Ont., and educated at the University of Toronto. He began his career as a writer by the publication of *The Smoke Eaters* (1905). This was followed by *A Grand Army Man* (1908); *The Beast and the Jungle*, with Judge Ben B. Lindsey (1910); *Polygamy* (1914); *From the Life* (1919); *The Doughboy's Religion*, with Judge Lindsey (1919); *Secret Springs* (1920); *Some Distinguished Americans* (1922); and *The American Mind in Action* (1924). He also wrote several plays with Harriet Ford. Some of these were successfully produced.

**OHIO.** Ohio is the thirty-fifth State in size (41,040 square miles) and the fourth in population; capital, Columbus. The population increased from 4,767,121 in 1910 to 5,759,394 in 1920, a gain of 20.8 per cent. The white population increased from 4,654,897 to 5,571,893; negro, from 111,452 to 186,187; native white, from 4,057,652 to 4,893,196; and foreign-born white, from 597,245 to 678,697. The urban population rose during the decade from 2,665,143 to 3,677,136; the rural population, on the other hand, fell from 2,101,978 to 2,082,258. The growth of the principal cities was as follows: Cleveland, from 560,663 in 1910 to 796,841 in 1920; Cincinnati, 363,591 to 401,247; Toledo, 168,497 to 243,164; Columbus, 181,511 to 237,031; Akron, 69,061 to 208,435 (see articles on these cities).

**Agriculture.** As Ohio is an important grain-growing State, agricultural conditions in the decade 1910-20 were affected by the fluctuations in production and prices of grain during the War and post-war period. The general agricultural history of the period is treated under AGRICULTURE, CORN, BARLEY, WHEAT, etc. Agriculture in most of its phases showed a decline in the State during the decade. While the population increased 20.8 per cent, from 1910 to 1920, the rural population decreased from 51.9 per cent in 1900 and 44.1 per cent in 1915 to 36.2 per cent in 1920. The number of farms decreased 5.6 per cent (from 270,045 in 1910 to 256,695 in 1920); the acreage of land in farms, from 24,105,708 to 23,515,888, or 2.4 per cent, and the improved land in farms, from 19,277,969 acres to 18,542,353, or 3.6 per cent. The percentage of total area in farms decreased from 92.5 in 1910 to 90.2 in 1920; the percentage of land improved from 73.7 to 71.1. Farm land value increased in the decade largely as a result of war prices for farm products. The total

value of farm property rose from \$1,902,694,589 in 1910 to \$3,095,666,336 in 1920 or 62.7 per cent; the average value per farm from \$6994 to \$12,060. In interpreting these values and all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 256,695 farms in 1920, 177,986 were operated by owners, 3065 by managers, and 75,644 by tenants. The comparative figures for 1910 were 192,104, 2753, and 77,188. White farmers in 1920 numbered 255,079; colored farmers, 1616. In 1910, white farmers numbered 270,095, and colored farmers, 1950. Farms free from mortgage in 1920 numbered 110,004; those under mortgage, 50,784. In 1910, farms free from mortgage numbered 135,616; those under mortgage, 54,997. The total number of cattle in 1920 was 1,926,823, of which 1,349,373 were dairy cattle. In 1910 the cattle numbered 1,837,607 (dairy cattle, 905,125). Sheep in 1920 numbered 2,102,550, compared with 3,909,162 in 1910; hogs, 3,083,846, compared with 3,105,627. The estimated production of the principal farm crops in 1923 was as follows: corn, 177,794,000 bushels; spring wheat, 465,000 bushels; winter wheat, 42,588,000 bushels; oats, 55,078,000 bushels; rye, 1,302,000 bushels; barley, 2,076,000 bushels; potatoes, 11,533,000 bushels; sweet potatoes, 335,000 bushels; hay, 3,557,000 tons; tobacco, 42,770,000 pounds; and sugar beets, 385,000 short tons. Comparative figures for 1913 are: corn, 146,250,000 bushels; wheat, 35,100,000; oats, 54,360,000; rye, 1,600,000; barley, 960,000; potatoes, 10,240,000; hay, 3,848,000 tons; and tobacco, 61,425,000 pounds.

**Mining.** Ohio is one of the most important of the mineral-producing States. In point of value of products, it ranked sixth in 1921. Its chief products are coal, clay products, petroleum, and natural gas. The table gives figures on

facturing establishments in 1909; 15,658 in 1914; and 16,125 in 1919. Persons engaged in manufacture numbered 523,004, 606,807, and 882,918; and the capital invested amounted to \$1,300,732,732, \$1,677,551,663, and \$3,748,743,996 in those years. The value of products was \$1,437,935,817 in 1909; \$1,782,808,279 in 1914; and \$5,100,308,728 in 1919. The large increase in value of products was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the census period 1915-19; but the increase in number of establishments and in number of wage earners clearly indicates decided growth in the manufacturing activities of the State. The most important industry in point of value of product is iron and steel, in 1909 amounting to \$197,780,000; 1914, \$205,023,000; and in 1919, \$626,370,000. Foundry and machine-shop products rank second in point of value: in 1909, \$145,837,000; in 1914, \$178,855,000, and in 1919, \$572,079,000. In third place is the manufacture of rubber tires and rubber goods, in 1909 valued at \$53,911,000; in 1914, \$109,659,000; and in 1919, \$551,118,000. The manufacture of automobiles, bodies and parts, ranking fourth, had a product valued at \$38,839,000 in 1909; \$85,711,000 in 1914; and \$379,436,000 in 1919. The principal manufacturing cities of the State are Cleveland, Akron, Cincinnati, and Toledo. In Cleveland, there were 2148 manufacturing establishments in 1909, with a product valued at \$271,961,000; 2345 in 1914, with \$352,418,000; and 2946 in 1919, with \$1,091,577,000. In Cincinnati, there were 2183 in 1909, with \$192,516,000; 2135 in 1914, with \$210,860,000; and 2239 in 1919, with \$500,041,000. Akron had 246 manufacturing establishments in 1909, with a product of \$73,158,000; 305 in 1914, with \$122,292,000; and 304 in 1919, with \$558,962,000. Similar figures for Toledo were: 760 in 1909, with \$61,230,000; 713 in 1914, with \$115,049,000; and 671 in 1919, with \$293,521,000. Other important

## MINERAL PRODUCTS IN OHIO

|      | Coal       |              | Clay products | Petroleum |              |
|------|------------|--------------|---------------|-----------|--------------|
| Year | Net tons   | Valued at    | Valued at     | Barrels   | Valued at    |
| 1914 | 18 843,115 | \$21,250,642 | \$37,166,768  | 8,536,352 | \$13 372,729 |
| 1915 | 22,434,691 | 24,207,075   | .....         | 7,825,326 | 10,061,493   |
| 1916 | 34,728,219 | 46,150,907   | 44,947,877    | 7,744,511 | 16,154,940   |

the first three. The diminished output of coal in the latter two years was due largely to the long strike that occurred in 1921 and affected the entire mid-Western field. In addition to these three minerals, the State produces large quantities of natural gas, natural-gas gasoline, sand and gravel, and stone. The total value of the mineral products in 1921 was \$223,533,658, compared with \$355,844,499 in 1920; \$214,829,888 in 1919; \$246,162,215 in 1918; and \$101,661,384 in 1914.

**Manufactures.** Ohio is one of the most important States industrially. In 1920, there were 50 cities having more than 10,000 inhabitants, and forming 54.5 per cent of the total population of the State. These cities, in 1919, reported 79.6 per cent of the State's manufactured products. There were in the State 15,138 manu-

facturing cities are Columbus, Dayton, Canton, Springfield, and Youngstown.

**Education.** The greatest advancements in education in Ohio after 1913 were county school systems and trained teachers. There was no supervision of rural schools until 1914, when county boards of education were established. These boards elect county superintendents of schools and, if necessary, assistants. Hundreds of centralized rural schools of the best type have been built under the new régime, most of which include high schools. No training was required of teachers prior to 1914, except by certain city boards of education. The requirements were increased gradually, until the standard rose in 1921 to a full year of normal work, which is, in effect, a year beyond a four-year high school course. Two new State normal

schools were started in 1913; and a county normal school plan was adopted to supplement the other agencies for preparing elementary teachers. There are over 50 of these schools with work of strictly collegiate grade. Some of the private colleges, of which there are many in Ohio, also undertook to train elementary teachers, under the supervision of the State Department of Education. In 1924, all but two of the standard colleges prepared high school teachers with the large amount of professional training required by the 1914 law. High school supervision by the State university was merged with that of the State Department of Education. Most high schools rose to first grade rank. The compulsory education law of 1921 requires attendance to the age of 18 of those not through high school; those fitted may secure work certificates at 16. Other advances are: much improvement in day schools for blind, deaf and crippled; State and many county supervisors of music; moving picture censorship under State director of education; increase of director's salary from \$4000 to \$6500; establishment of Smith-Hughes vocational work, especially strong in part-time industrial education; a model teachers' retirement law; increase of State aid to weak school districts from about \$200,000 to \$2,400,000 with the administration entirely under the State director of education. The enrollment increased from 895,167 in 1914 to 1,180,641 in 1923. The average attendance increased from 720,442 in 1914 to 1,004,235 in 1923. Illiteracy in the State decreased from 4 per cent in 1910 to 3.6 in 1920; in the native white population, from 2.2 per cent to 1.2 per cent; among the foreign-born white, rose from 11.8 per cent to 13.4 per cent; and among the Negroes, fell from 13.9 per cent to 9.7 per cent.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** There were many important political events in the history of Ohio in the decade 1914-24. For the greater part of the period the Republican party remained in control, but during a portion of the time, the Democrats developed sufficient strength to elect candidates for office and to control the Legislature. Elections were held in 1914 for State officers and United States Senator. Warren G. Harding, former lieutenant-governor, was nominated by the Republicans for the Senatorship, and Timothy S. Hogan by the Democrats. For governor, the Republicans nominated Frank B. Willis and the Democrats James M. Cox. Willis was elected governor, and Harding, Senator. While the Republicans carried practically the entire State ticket, an amendment establishing county local option was carried in this election, while amendments providing for woman suffrage and prohibition were defeated. In April of this year the coal mines of the State were shut down as the result of the failure to negotiate an agreement as to payment between employers and employees. The strike continued during the year, involving great suffering to the miners and huge losses to the industry. In 1915 a constitutional amendment forbidding the sale of intoxicating liquors was submitted to the people and was rejected. Severe floods in the State, in July of this year, resulted in the death of five and damage of more than \$2,000,000,000. In 1916 the Republicans renominated Governor Willis, while the Democratic nominee was James M. Cox. The Democrats renominated Senator Pomerene; the

Republicans, Myron T. Herrick. The entire State Democratic ticket was elected, and Senator Pomerene was reelected. In the presidential voting of this year, President Wilson received 604,161 votes; Charles E. Hughes, 514,753. During this year there were serious labor troubles in the State, and riots in East Youngstown among the steel workers resulted in great damage to property and the destruction of practically the entire business section by fire. In 1917 the people defeated a law permitting women to vote for presidential electors. In the same election a prohibition amendment was rejected. Governor Cox was renominated by the Democrats in 1918 and was reelected. A State-wide prohibition amendment was adopted at this election. The Republicans were again successful in the State campaign in 1920, electing their candidate for governor, Harry L. Davis, while Frank L. Willis was elected to the Senate. In this year both candidates for President were natives of Ohio. In the presidential vote, Warren G. Harding received 1,182,022 votes; James M. Cox, 780,037. In 1921, at a special election, the people of the State ratified a soldiers' bonus of \$25,000,000. In 1922 the Republicans nominated for governor Carmi A. Thompson, while the Democratic nominee was A. V. Donahey. For United States Senator the Republican candidate was Simeon D. Fess, member of Congress. The Democrats renominated Senator Pomerene. Donahey was elected governor, and Fess, Senator. At this election the constitutional amendment providing for the sale of beer and light wines was proposed for submission. The Secretary of State refused to certify the amendment for a vote on the ground that even if adopted, it would be without effect. The Supreme Court ordered him to place the proposal on the ballot. It was rejected by the people by a majority of over 180,000 votes. In 1923 the people rejected, on November 6, an old-age pension proposal and approved an amendment relieving employers from liability in private suits where covered by the State workmen's compensation insurance. On June 28, 1924, the city of Lorain and others west of it were swept by a tornado which did damage of more than \$50,000,000 and took 94 lives, 71 of them in Lorain. Most of the business district of Lorain was devastated.

**Legislation.** Among the important acts of the Legislature in the decade 1914-24 were the following. Two special sessions were held in 1914. An act was passed reorganizing the agricultural interests of the State and creating an agricultural commission. The common school system was also reorganized. In 1917 the Legislature was under Democratic control. A law was passed permitting women to vote for president. This, as noted above, was defeated by the people. The Federal prohibition amendment was ratified by the Legislature on Jan. 7, 1917, but on November 4 of that year, the amendment was rejected by the people by a majority of 542. On Jan. 6, 1919, the Legislature ratified the Federal woman suffrage amendment. At this session of the Legislature, statutes were passed defining and punishing criminal syndicalism and sabotage. The teaching of German in the elementary grades of public and parochial schools was forbidden. A new State highway act was passed. The Legislature of 1921 amended the compulsory education laws; made provision for coöperative marketing; passed

measures for the enforcement of the prohibition law, and amended the laws relating to the finances of the State. The Legislature in 1923 created a judicial council of nine judges and passed an old-age pension proposal, which was on Nov. 6, 1923, rejected by the people.

**OHIO STATE UNIVERSITY.** A coeducational institution at Columbus, Ohio, founded in 1870 and supported by appropriations from the State and Federal governments. The enrollment of the university more than doubled between 1914 and 1923-24, increasing from 4466 in the former year to 9875 in the latter. In the same period the faculty increased from 423 to 718 members, the library from 138,101 to 238,154 volumes, and the income from \$1,276,134 to \$4,499,577.68. The campus and university farm covered 880 acres. The university consisted in 1924 of 10 colleges and the Graduate School. In 1914, the Sterling Ohio Medical College, including the dental school, was incorporated as part of the university. The College of Commerce and Journalism was added in 1916. In 1922 and 1923-24, many new buildings were erected, including Mack Hall, a new residence hall for women; Pomerene Hall, a women's gymnasium; the Ohio Stadium; the new administration building; the new commerce building; the new journalism building; new chemistry laboratories; Hamilton Hall, the new medical science building; and an art studio. New structures also were erected for beef cattle, dairy cattle, hogs and sheep. About \$200,000 was expended on enlarging the power plant. Contracts were to be let in 1923-24 for a new university hospital and addition to medical science building to cost more than \$750,000. The sum of \$50,000 was appropriated for a residence for the president of the university, to be erected on the campus. During this period the university began to operate on the four-quarter system, abandoning the semester plan. The quarters were 12 weeks in length. The schedule was so arranged that a student might enter at the beginning of any quarter. Gifts to the university included \$17,000 from Charles Cutler Sharp for the establishment of the Sharp Library Fund for purchase of books for the department of chemistry. President, W. O. Thompson, D.D., LL.D.

**OHIO WESLEYAN UNIVERSITY.** A coeducational institution at Delaware, Ohio, founded in 1844. The student enrollment increased from 1126 in 1914 to 1797 in 1923-24, the faculty was increased in membership from 66 to 126, and the library from 66,210 to 95,061 volumes. During the decade, departments of education, home economics, business administration, and religious education were founded. Austin Hall was built and the new Perkins observatory was begun. The Z. T. White building, in the heart of Columbus, valued at approximately \$1,000,000, was bequeathed to the university by Mr. White in 1922, and \$250,000 was given for the purchase and maintenance of a 61-inch reflecting telescope. In the same year, the university began a campaign to raise \$8,000,000 to add to the endowment and provide funds for 16 new buildings. John Washington Hoffman, D.D., LL.D., succeeded Herbert Welch, D.D., as president in 1916.

**OIL.** See PETROLEUM.

**OIL ENGINE.** See INTERNAL-COMBUSTION ENGINES.

**OIL SCANDALS.** See UNITED STATES, *History*.

**OISE, BATTLES OF THE.** See WAR IN EUROPE, *Western Front*.

**OKLAHOMA.** Oklahoma is the seventeenth State in size (70,057 square miles) and the twenty-first in population; capital, Oklahoma City. The population increased from 1,657,155 in 1910 to 2,023,283 in 1920, a gain of 22.4 per cent. The white population increased from 1,444,531 to 1,821,194; the Negro, from 137,612 to 149,408; and the native white, from 1,404,447 to 1,781,226. The Indian population decreased from 74,825 to 57,337; and from 40,084 to 39,968. Both the urban and rural populations increased; the former from 320,155 to 539,480; the latter from 1,337,000 to 1,488,803. The growth of the principal cities was as follows: Oklahoma City (q.v.), from 64,205 in 1910 to 91,295 in 1920; Tulsa (q.v.), 18,182 to 72,075; Muskogee, 25,278 to 30,277.

**Agriculture.** As Oklahoma is an important grain-producing State, agricultural conditions during the decade 1910-20 reflected the fluctuations of price and production which characterized war and post-war conditions. The general situation is discussed under AGRICULTURE, CORN, WHEAT, etc. Oklahoma is an important producer of cotton, and though not affected as much as some of the other cotton-producing States by the ravages of the boll weevil, which vary in intensity with the season, the damage and uncertainty were considerable in some years. The fluctuations of the cotton crop in the decade are indicated by the following figures: 1913, acreage, 3,009,000, production 840,000 bales; 1916, 2,562,000, and 823,000; 1920, 2,749,000, and 1,336,000; 1921, 2,206,000, and 481,000; 1922, 2,951,000, and 635,000. The estimated production for 1923 was 945,000 bales.

While the population of the State increased 22.4 per cent during the decade, the number of farms increased only 0.9 per cent (from 190,192 in 1910 to 191,988 in 1920). The total area of land in farms, however, increased from 28,859,353 acres to 31,951,934, or 10.7 per cent; and the improved land in farms, from 17,551,337 to 18,125,321 acres, or 3.3 per cent. The percentage of the total area in farm land increased from 65 in 1910 to 71.9 in 1920; the percentage of land improved from 39.5 to 40.8. The total value of farm property showed an apparent increase, from \$918,198,882 to \$1,660,423,544, or 80.8 per cent; the average value per farm, from \$4828 to \$8649. Of the total of 191,988 farms in 1920, 93,217 were operated by owners, 935 by managers, and 97,836 by tenants. The corresponding figures for 1910 were 85,404; 651, and 104,137. White farmers numbered 173,263 in 1920 and 169,521 in 1910. Colored farmers numbered 18,725 in 1920; 20,671 in 1910. Farms free from mortgage in 1920 numbered 30,551; those under mortgage, 47,025. In 1910, unmortgaged farms numbered 46,889; those under mortgage, 36,036. The total number of cattle in 1920 was 2,073,945, of which 808,459 were dairy cattle. In 1910, cattle numbered 1,953,560; dairy cattle, 530,796. Sheep in 1920 numbered 105,370; in 1910, 62,472. The number of hogs decreased notably from 1,839,030 to 1,304,094; owing to high prices for grain during the War, wheat being planted instead of corn. The estimated production of the principal farm crops in 1923 was as follows: corn, 39,491,000 bushels; wheat, 36,300,000 bush-

els; oats, 22,522,000 bushels; barley, 2,557,000 bushels; grain sorghum, 18,276,000 bushels; potatoes, 2,381,000 bushels; sweet potatoes, 1,889,000 bushels; hay, 935,000 tons. Comparative figures for 1913 are: corn, 52,250,000 bushels; wheat, 17,500,000; oats, 18,540,000; barley, 63,000; potatoes, 1,920,000; and hay, 382,000 tons.

**Mining.** Oklahoma, although it produces no metals, ranks fourth among the States in value of mineral production. This is due chiefly to the development of the petroleum fields in the State during the decade 1914-24. The production of petroleum, in 1914 was 73,631,724 barrels; (1915) 97,915,243; (1916) 107,071,715; (1917) 107,507,471; (1918) 103,347,070; (1920) 106,206,000; (1921) 114,634,000; (1922) 149,571,000. The production of natural gas kept pace with the development of the petroleum fields, the production in 1914 being 78,167,414 thousand cubic feet; 123,517,358 (1916); 124,317,179 (1918); 154,467,200 (1920); 124,058,000 (1921). The production of natural-gas gasoline became extremely important in the last few years; 178,856,929 gallons were produced in 1920 and 185,340,742 gallons in 1921. The coal production is about 4,000,000 tons annually; it was 3,988,613 tons in 1914; 4,813,447 in 1918, and 2,802,511 in 1922. In addition to the minerals mentioned, the State produces cement, gypsum, lead, sand and gravel, and stone. The total value of the mineral production of the State in 1921 was \$269,882,786, compared with \$493,320,359 in 1920; \$291,078,174 in 1919; \$336,857,921 in 1918; and \$78,744,447 in 1914.

**Manufactures.** Oklahoma is not one of the leading industrial States, but its manufacturing activities have shown great increase in value of products and in number of persons employed in recent years. In 1920, there were 12 cities with 10,000 inhabitants or more, which contained 15.6 per cent of the total population of the State, and in 1919 reported 33.3 per cent of the value of the State's manufactured products. There were in the State 2310 manufacturing establishments in 1909; 2518 in 1914; and 2445 in 1919. Persons engaged in manufacture numbered 18,034, 22,700 and 38,314; and the capital invested amounted to \$38,872,938, \$65,477,654, and \$277,034,318, in those years. The value of manufactured products in 1909 was \$53,682,405; in 1914, \$102,005,693; and in 1919, \$401,362,869. The large increase in value of products from 1914 to 1919, was chiefly due to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of wage earners clearly indicates growth in the manufacturing activities of the State. Petroleum-refining is the most important industry in point of value of product. This amounted to \$1,055,000 in 1909; \$13,014,000 in 1914; and \$150,673,000 in 1919. Flourmill and gristmill products rank second in this respect, with a value, in 1909, of \$19,144,000; 1914, \$16,689,000; and 1919, \$49,844,000. The smelting and refining of zinc, in third place, had a product, in 1909, valued at \$3,002,000; 1914, \$9,939,000; and 1919, \$19,518,000. The manufacture of cottonseed oil and cake was fourth: valued in 1909 at \$5,187,000; in 1914, \$7,590,000; and in 1919, \$18,907,000. The chief manufacturing cities are Oklahoma City and Tulsa. In Oklahoma City,

there were 171 manufacturing establishments in 1909, with a product valued at \$7868; 195 in 1914, with \$20,726,000; and 227 in 1919, with \$69,971,000. Tulsa had 53 establishments in 1909, with a product valued at \$1563; 103 in 1914, with \$3,868,000; and 135 in 1919, with \$14,050,000. Other important manufacturing cities are Enid, Muskogee, Guthrie, and McAlester.

**Education.** Satisfactory progress was made in education in the decade 1914-24. The period witnessed a remarkable growth in the wealth and population of the State, which made possible better schools. The average length of the school term was considerably increased during the decade, and additional teachers were employed. The normal school facilities, which had always been insufficient, were increased by the provision for normal training in certain selected high schools. There was a large increase in the number of schools offering high-school courses, and high-school opportunities to rural children were greatly extended by the organization of graded and consolidated districts. A large colored and Indian population greatly increased the educational difficulties of the State. The enrollment in the public schools increased from 496,908 in 1914 to 609,767 in 1921. The enrollment in white rural schools in 1920 was 544,821, and in colored rural schools, 44,461. In elementary rural schools for white pupils there were enrolled 517,317 in 1921; in white high schools, 47,893, in Negro elementary schools 42,938; and in Negro high schools, 1619. The expenditures for schools in 1921 was \$28,368,688. The total enrollment in the graded schools for 1923 was 637,299; and the school expenditure in that year was \$30,479,355. The percentage of illiteracy in the State decreased from 6.9 in 1910 to 4.7 in 1920; in the native white population, from 4.2 to 2.9 per cent; rose in foreign-born white, from 9.7 to 13.4; fell in negro, from 22.7 to 16.4.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** During the decade 1914-24 the State continued to be Democratic in politics. At elections held for governor and United States Senator in 1914, Senator Gore was reelected, and R. L. Williams, the Democratic candidate, was elected governor. The Democrats also elected Representatives to Congress in all districts except one. On Jan. 21, 1915, the United States Supreme Court declared unconstitutional the so-called "grandfather clause" to the constitution, which disfranchised a large percentage of the negroes of the State. There was no election for State officers in 1916. In the presidential voting of this year President Wilson received 148,626 votes; Charles E. Hughes, 98,299. In 1918 Senator Owen was renominated by the Democrats, and Judge J. B. A. Robertson received the Democratic nomination for governor. Both were elected in November. Elections were held in 1920 for United States Senator. John W. Harrold, Republican, defeated Scott Ferris, Democratic nominee, by a large majority. In the presidential voting of this year, W. G. Harding received 243,415 votes; J. M. Cox, 215,521. An attempt was made in April, 1921, to impeach Gov. J. B. A. Robertson. This failed in the Legislature. On Mar. 22, 1922, Governor Robertson was arrested for bribery in connection with the insolvency of the Guarantee State Bank of Okmulgee. In the State election of 1922, J. C. Walton, Democratic candidate, was

elected governor. Alice Robertson, a Representative to Congress in 1920, was renominated by the Republicans, but was defeated. In the summer of 1923, as a result of alleged outrages by the Ku Klux Klan, Governor Walton placed the State under martial law. The Legislature denied his right to do this and wished to hold a special session in order to impeach him. Governor Walton denied their right to meet, and the members of the Legislature circulated a petition among themselves for a special session. The Adjutant-general of the State was ordered by the Governor to prevent their meeting, but the legislators entered the Capitol without hindrance, although they were prevented from assembling by an officer of the National Guard. An injunction was thereupon obtained preventing the National Guard from interfering. Previous to these events, Governor Walton had called a special election to pass on proposed amendments to the State constitution. One of these would permit the Legislature to assemble without the Governor's consent on a call of a majority of its members. The Attorney General attempted to have ballots for this measure cast by the Supreme Court, but the petition was denied. The Governor thereupon ordered out the National Guard to prevent the election. The local boards ordered the ballots printed, and citizens were urged to vote in spite of the Governor's proclamation to the contrary. At the special election the amendment was passed. Governor Walton then ordered the Legislature to meet but specified that it should devote its attention exclusively to the Ku Klux Klan. On assembling, the House at once began preparations for impeaching Governor Walton, and charges were filed with the Senate acting as a court of impeachment. The Legislature also passed a resolution for the investigation of the Ku Klux Klan, but the motion to expel members of the Klan from the House was defeated. In November, Governor Walton was found guilty on 11 counts, including charges that he had padded the State payroll, prevented the assembling of the Grand Jury, attempted to prevent a special State election, exceeded the legal limit of election expenses, and was generally incompetent. The Governor presented no defense. He was succeeded by the Lieutenant-Governor.

**Legislation.** Among the important acts of the Legislature in the decade 1914-24 were the following. A budget system was created by the Legislature of 1919. At this session also measures were passed defining and punishing criminal syndicalism and sabotage. In 1923 the Legislature passed a measure providing for industrial rehabilitation and farm or home aid for veterans of the War. A measure was also passed making robbery or its attempt punishable by a minimum of 25 years in prison. The Legislature also passed a bill prohibiting the Ku Klux Klan and members of other organizations from wearing masks in public.

**OKLAHOMA, UNIVERSITY OF.** A coeducational State institution at Norman, Okla., founded in 1892. The student enrollment was doubled in the decade between 1914 and 1923-24, from 1700 in the former year to 3401 in the latter. The faculty was increased in the same period from 135 to 203 and the library from 23,000 to 52,000 volumes. The income increased from \$253,500 in 1916 to \$1,020,000 in 1923-24. The School of Social Service was established and the department of manual train-

ing in the College of Engineering opened in 1917, special war courses were offered in 1918, and the School of Public and Private Business was organized in 1923 as a separate school with authority to grant the B.S. degree. Up to that time the B.A. degree with special certificate in public and private business had been conferred in the College of Arts and Sciences. An auditorium, a fine arts building, a library building, a geology building, a hospital and an armory were erected in 1920, and a women's building in the following year. Stratton D. Brooks was president during the period until 1923, when J. S. Buchanan became acting president.

**OKLAHOMA CITY.** The capital and commercial centre of Oklahoma. The population increased from 64,205 in 1910 to 91,295 in 1920, to 101,150 by estimate of the Bureau of the Census for 1923, and to 140,000 by local estimate in 1924. During the decade of 1914 to 1924, the city completed a \$5,500,000 water system capable of supplying a much larger city, and a \$1,000,000 power plant, and increased the value of its schools from \$2,456,000 to \$8,494,000. Bank clearings rose from \$115,879,816 in 1914 to \$1,165,341,665 in 1923.

**OLD AGE PENSIONS, IN THE UNITED STATES.** The United States adopted old age pensions very slowly. The proportion of aged persons in its population was considerably smaller than in some of the older countries; and its largely agricultural population did not show the evils of indigent old age so quickly as those of more thickly populated areas. Up to 1913, practically the only measures that had been taken to relieve the hardships of the old age of workmen were those of railroads and large industrial concerns, which provided for the retirement with pension of their own employees, usually at the age of 65. In most cases no contributions from the beneficiaries were required. The trade unions objected to this method of provision. The employer admitted no legal claim to a pension and retained the right to withdraw the pension offer if an employee were guilty of misconduct, which discouraged strikes and tied the worker's hands. Old age insurance was offered by a very few trade unions and a few fraternal organizations. The pensioning of municipal, State and Federal employees, though growing, was still quite limited. Retirement funds for teachers, policemen, and firemen, however, were becoming common. Some provision for old age insurance through savings banks had been made in Massachusetts in 1907 and in Wisconsin in 1911. But the only comprehensive system was that of military and naval pensions; and in not one of the public measures was the lower-paid and most needy class of workers provided for.

Development in the decade 1914-24 continued for some time solely to affect public employees and workers in corporations. In 1915, the Winchester Arms Company installed a pension system affecting about 12,000 persons, and the Wells Fargo Express Company adopted a similar scheme in the following year. In 1920, Congress passed a comprehensive bill providing for the retirement of employees in the Civil Service, under which contributions by employees to the extent of 2½ per cent of their basic compensation, and retirement at 70 after 15 years of service, were compulsory, and old age and total disability pensions were granted in ratio to contribution and length of service. Beyond

the unsuccessful launching of an old age pension bill in Ohio in 1917, nothing had been accomplished up to this time in the way of old age pensions proper. But interest had by no means been dormant; in 1921-22 this gained impetus; labor organizations, church bodies, and industrial leaders took up the cry; in that year old age pension acts, of varying nature, were introduced in 15 State Legislatures and in Congress. Definite results came in 1923, when State laws for old age assistance were passed in Montana, Nevada, and Pennsylvania. The Nevada law required that applicants be at least 60 years of age, citizens of the United States for at least 15 years, and residents of the State for at least 10 years. The income of beneficiaries from pension and all other sources was not to exceed \$1 per day. Inmates of prisons, workhouses, etc., were barred; also those who had been in prison for four months or more during the 10 years preceding, if such sentence were without the option of a fine; those who had within the preceding 10 years deserted spouse or failed to support children for six months; those who had children capable of and responsible for support; also those who owned property exceeding \$3000. Where needed, a maximum funeral benefit of \$100 was provided for. Provisions were made for cases where claimant owns property. In the Pennsylvania act the pension age was 70, and the State residence requirement 15 years; in Montana, the pension age was 70 and the citizenship and State residence requirement 15 years; otherwise the provisions were essentially the same as those of the Nevada measure. In Alaska, in 1923, the act of 1915 was amended to reduce the pension age from 65 to 60 for women, and increase the maximum monthly allowance from \$12.50 for either sex to \$25 for men and \$45 for women; while the residence requirement was increased from 10 to 15 years. The growth of the movement was evident in other States, also. Old age pension bills, although they were not passed, became definite political issues in Ohio and Illinois; and Massachusetts and Indiana appointed commissions to study the subject. The desirability of a Federal system was beginning to be discussed, to prevent migration, and to equalize the burden that it might not bear too heavily on communities where the percentage of aged people was higher. Although so far the non contributory system appeared to be in favor, the compulsory-contributory type of protection was not without strong advocates who argued that this system was necessary to preserve the dignity of labor, to encourage thrift, and to conform to the principles of sound finance.

**Other Countries.** Expenditures for old age pensions increased as follows: in Denmark, from \$2,643,125 in the fiscal year 1909-10, to \$15,959,400 in the fiscal year 1919-20; in Great Britain, from £8,468,128 in the fiscal year 1910-11, to £25,087,000 in 1920-21; in New Zealand, from £362,496 in 1910 to £731,343 in 1921; and in Australia (invalidity pensions included) from £1,868,648 in 1911 to £5,337,936 in 1923. This increase in aggregate expenditures during the decade was, however, largely due to increases in the pension rates to meet the reduced purchasing power of money. The percentage of persons assisted under pension laws likewise showed an increase in general. In Denmark, it rose from 2.4 in 1910 to 3.3 in 1920; in the latter year more than 34 per

cent of the entire male population, and 48 per cent of the women, over 60 years of age, were pensioners. The number pensioned in Great Britain increased from 669,362 in 1910-11 to 1,029,307 in 1921-22. In 1915, of the entire population over 70, about 65 per cent were being thus supported. In New Zealand, however, the proportion of old age pensioners to total population, which was placed in 1910 at 1.8 per cent, fell to 1.6 per cent in 1920; and in Australia, while the proportion rose from 1.5 per cent in 1910 to 1.92 in 1921, there was a decline in 1923 to 1.91 per cent.

In 1919, Uruguay passed an old age pension law affecting all persons reaching the age of 60, and other entirely incapacitated and indigent, granting not less than 96 pesos or \$99.28 annually, in cash or assistance, foreigners and naturalized citizens of 15 years' continuous residence being entitled to the benefits; the funds being drawn from increased taxes on employers, real estate, and on playing-cards and liquors. In England, the Old Age Pension Act of 1909, providing for weekly allowances of not more than 5 shillings to persons over 70 whose incomes were under \$157.50 per year, was amended in 1916 to permit slightly increased allowances in needy cases, and in 1919 the allowance was raised to 10 shillings. The Act was latterly subject to much criticism. Although expenditures had risen rapidly, it was claimed that the allowance still was insufficient and that many who had left workhouses to accept pensions had returned. It was also said that the system was an incentive to fraud and improvidence in its existing form (although careful scrutiny of claims had brought the cost of administration almost to £1,000,000 annually), and an amendment to the law to give the pension to all citizens at the age of 70 regardless of means was proposed, but defeated, in 1923. France, in 1910, adopted a compulsory system of old age insurance which was expected practically to supersede the old age pension system, but this had not fulfilled expectations, and in 1924 measures to strengthen it were under consideration. Denmark raised the age limit for old age pensions from 60 to 65 years, in order to reduce expenditures. The old age pension systems of Australia (1916) and New Zealand (1898) seemed to be exempt from domestic criticism. The maximum annual allowances in those dominions were \$162 and \$130, respectively. Spain, in 1919, replaced its system of voluntary state-aided annuities with a compulsory insurance plan affecting all wage earners between 16 and 65 and in 1921 extended this to include all whose annual wage was less than 4000 pesetas (\$772). In Italy, in 1920, the compulsory old age insurance act for seamen was replaced by one applying to practically all manual workers, salaried employees and professional classes. The temporary old age pension act passed in Belgium in 1920 was extended in 1923 for a further period of three years, a compulsory insurance law covering old age and death being meanwhile under consideration. In Germany, the compulsory old age and invalidity insurance law was amended in 1916, reducing the age limit from 75 to 65. The compulsory old age insurance law of Sweden, passed in 1913, was still the only law of universal application, affecting the entire population, from 16 to 67 years of age, with the exception of certain persons subject to state pensions.

**OLMSTEAD, FREDERICK LAW** (1870- ). An American landscape architect (see Vol. XVII). From 1902 to 1917 he was landscape architect for the Baltimore Park Commission and from 1908 landscape architect for the Sage Foundation Homes Company. He was professor of landscape architecture at Harvard University, 1903-14, and during 1910-19 he was a member of the National Commission of Fine Arts. He was chairman of the Executive Committee of the National Conference on City Planning from 1910 to 1919 and was governor of the American City Planning Institute. In 1917-18 he was a member of the Commission on Emergency Construction of the War Industries Board and during the same period manager of the town planning division of the United States Housing Corporation.

**OLYMPIC GAMES.** The first Olympic Games since the War were held at Antwerp, Belgium, in 1920, the athletes of the United States repeating their triumph of 1912 at Stockholm, Sweden. In the track and field events the Americans scored more than double the number of points collected by their nearest competitor. The final standing of the various countries entered was: United States, 212 points; Finland, 105; Sweden, 95; England, 92; France, 35; Italy, 28; South Africa, 24; Canada, 10; Norway, 10; Denmark, 9; Esthonia, 8; New Zealand, 5; Belgium, 5; Australia, 5; Czechoslovakia, 3; Holland, 2; Luxemburg, 1.

Five new world's and three new Olympic records were made as follows: 400-meter hurdles, Loomis, U. S., 54 seconds (world); pole vault, Foss, United States, 13 feet, 5 $\frac{1}{4}$  inches (world); 400-meter relay, U. S. team, 42 $\frac{1}{2}$  seconds (world); javelin throw, Myrra, Finland, 215 feet, 9 $\frac{1}{4}$  inches (world); 110-meter high hurdles, Thompson, Canada, 14 $\frac{1}{2}$  seconds (world); throwing 56-pound weight, McDonald, U. S., 36 feet, 11 $\frac{1}{2}$  inches (Olympic); running high jump, Landon, U. S., 6 feet, 4 $\frac{1}{2}$  inches (Olympic); Marathon, Kolehmainen, Finland, 2 hours, 32 minutes, 35 $\frac{1}{2}$  seconds (Olympic).

The United States also won a sweeping victory in the swimming events, chiefly because of the fine work of Duke Kahanamoku, Pua Kealoha and Warren Kealoha, all of the Hawaiian Islands. Great Britain captured the final water polo match from Belgium by a score of 3 to 2. In women's swimming the United States again showed marked superiority through the brilliant efforts of Ethelda Bleibtrey, Aileen Riggan and Frances Cowells-Schroth. In rowing the United States Naval Academy won the eight-oared event; the American Kelly took the single sculls and Switzerland triumphed in the four-oared contest. The U. S. trap shooting team won, and Mark Arie of the United States carried off the individual championship. Canada won the hockey honors with the United States second. Great Britain was victor in the tennis competition, the United States being unrepresented because of the demands made upon the American players by the Davis Cup matches.

The first women's Olympic Games were held at Paris in 1922, the points being distributed among the various countries as follows: England, 50; United States, 31; France, 29; Czechoslovakia, 12; Switzerland, 6. In the 60-meter dash Mlle. B. Mejzlikova of Czechoslovakia set a new world's record of 7 $\frac{3}{4}$  seconds. Miss Camelia of the United States also distinguished

herself by running the 100-yard hurdles in 14 $\frac{1}{2}$  seconds.

The Olympic Games of 1924, held at the Colombes Stadium, near Paris, France, attracted entries from forty-five nations, twenty-seven of which were medal winners. The United States teams once more showed their supremacy, capturing the all-around championship through six months of keenest competition and carrying off the honors in track and field sports, rowing, swimming, tennis, Rugby, boxing, catch-as-catch-can wrestling, and rifle, pistol and target shooting.

In the track and field events the points were distributed among the various countries as follows: United States, 255; Finland, 166; Great Britain, 85 $\frac{1}{2}$ ; Sweden, 31 $\frac{1}{2}$ ; France, 26 $\frac{1}{2}$ ; Italy, 19; Switzerland, 15; South Africa, 11; Hungary, 10 $\frac{1}{2}$ ; Australia, 10; Canada, 8; Norway, 6; Argentina, 5; New Zealand, Holland and Esthonia, 4 each; Denmark, 3; Japan and Chile, 1 each.

The winners in the various events were: 10,000-meter run, Willie Ritola, Finland, 30 minutes, 23 $\frac{1}{2}$  seconds (world's record); javelin throw, J. Myrra, Finland, 207 feet; 100-meter dash, H. Abrahams, Great Britain, 10 $\frac{1}{2}$  seconds (equals Olympic record); 400-meter hurdles, F. M. Taylor, United States, 52 $\frac{1}{2}$  seconds (world's record); high jump, H. M. Osborne, U. S., 6 feet, 6 inches (Olympic record); pentathlon, Lehtonen, Finland (in this contest Robert Le Gendre, U. S., set a world's record of 25 feet, 6 inches for the broad jump); 800-meter run, D. G. A. Lowe, Great Britain, 1 minute, 52 $\frac{1}{2}$  seconds; broad jump, De Hart E. Hubbard, U. S., 24 feet, 6 inches; shot put, Clarence Houser, U. S., 49 feet, 2 $\frac{1}{2}$  inches; 110-meter hurdles, D. Kinsey, U. S., 15 seconds; 200-meter dash, J. V. Scholz, U. S., 21 $\frac{1}{2}$  seconds (equals Olympic record); 3000-meter steeplechase, Willie Ritola, Finland, 9 minutes, 33 $\frac{1}{2}$  seconds (world's record); 1500-meter run, Paavo Nurmi, Finland, 3 minutes, 53 $\frac{1}{2}$  seconds (Olympic record); 5000-meter run, Paavo Nurmi, Finland, 14 minutes, 31 $\frac{1}{2}$  seconds (Olympic record); hammer throw, F. D. Tootell, U. S., 174 feet; pole vault, L. Barnes, U. S., 12 feet, 11 $\frac{1}{2}$  inches; 400-meter run, E. H. Liddell, Great Britain, 47 $\frac{3}{4}$  seconds (world's record); 10,000-meter cross country run, Paavo Nurmi, Finland team, 32 minutes, 54 $\frac{3}{4}$  seconds; hop, step and jump, Winter, Australia, 50 feet, 11 $\frac{1}{2}$  inches (world's record); decathlon, H. M. Osborne, U. S., 7,710.775 points (world's record); 400-meter relay, United States team, 41 seconds (world's record); discus throw, Clarence Houser, U. S., 46 meters, 15 $\frac{1}{2}$  centimeters (Olympic record); 1600-meter relay, United States team, 3 minutes, 16 seconds (world's record); 3000-meter team race, Finland, 8 minutes, 32 seconds (Olympic record); 10,000-meter walk, U. Frigerio, Italy, 47 minutes, 49 seconds; marathon, Stenroos, Finland, 2 hours, 42 minutes, 22 $\frac{3}{4}$  seconds.

The United States won an even more sweeping victory in the swimming competitions, scoring 217 points, Sweden being second with 58 and Great Britain third with 50. John Weissmuller, U. S., set new Olympic records in the 100-meter and 400-meter free style events for men. Miss Sybil Bauer, U. S., established a world's record in the 100-meter back stroke competition for women, and Miss Ethel Lackie, U. S., equaled the world's record in the 100-meter free style contest.

In tennis the United States also had a walk-over, Vincent Richards winning the final of the men's singles from Henri Cochet of France, Miss Helen Wills capturing the women's singles from Miss Emilienne Vlasto of France, Richards and Francis T. Hunter taking the men's doubles and Miss Wills and Mrs. George W. Wightman triumphing in the women's doubles.

**OMAHA.** The largest city of Nebraska. The population rose from 156,231 in 1910 to 191,601 in 1920; to 208,025 by estimate of the Bureau of the Census for 1924, and to 217,329 by the school census for the same year. A comprehensive zoning ordinance was adopted in 1920. In the same year the Metropolitan Utilities District with plant valuation of \$13,000,000 was organized, controlling the city-owned gas and water systems; 60 miles of water mains were laid in 1923 and three 50,000,000-gallon pumps were installed in the water plant. The paved streets increased from 209 miles in 1915 to 402 miles in 1924; of this, 76 miles were laid in 1922 and 1923. In the latter year a technical high school was built at a cost of \$3,500,000, and a \$750,000 high school was under construction in 1924. A levee and retards were built along the Mississippi River. In 1924 Omaha holds record as the second live stock center of the country; 73 per cent of the 8,500,000 head received was consumed in the 14 packing plants of the city.

**OMAN.** See ARABIA.

**OMSK GOVERNMENT.** See SIBERIA AND THE FAR EASTERN REPUBLIC.

**ONCKEN, HERMANN** (1869- ). A German historian and professor. He contributed largely to the war literature of his country. Among his works are *Amerika und die Grossen Mächte: Historisch-politische Aufsätze* (1914); *Deutschlands Weltkrieg und die Deutsch-Amerikaner* (1914); *Unsere Abrechnung mit England* (1915); *Wie Ehrt ein Volk Seine Grossen Männer?* (1915); *Das Alte und das neue Mitteleuropa* (1917); *Ueber den Zusammenhang von Innerer und Aeusserer Politik* (1918); *Weltgeschichte und Versailler Friede* (1921); *Die Utopie des Thomas Mores und das Machtproblem in der Staatslehre* (1921); *Staatsnation und Kulturnation* (1922); *Lassalle* (1922); *Die Historische Rhein-politik der Franzosen* (1922); and *Aus Rankes Frühzeit* (1922).

**O'NEILL, EUGENE (GLADSTONE)** (1888- ). An American playwright, born in New York City, the son of James O'Neill, a celebrated actor. He was educated at De La Salle Institute and Princeton (1906-07) and Harvard University (1914-15). In 1909 he went to San Francisco and thence to Central America on a gold prospecting venture. After 1914, devoting himself to playwriting, he produced *The Moon of the Caribbees and Other Plays of the Sea* (1919); *Beyond the Horizon*, a tragedy in six acts (1919); *Thirst and Other Plays* (1914); *Emperor Jones*, an extraordinary monologue depicting the psychology of fear; *Diff'rent* (1921); *The Straw* (1921); *Gold* (1921); *Anna Christie* (1922); *The First Man and The Hair Ape* (1922); *The Fountain* (1923); *Welded*, and *All God's Chillun's Got Wings* (1924). He stands first among American dramatists; in his works lies the hope of a fine native drama. Some of his plays have been produced in Europe.

**ONTARIO.** A Canadian province, with an area of 407,262 square miles, of which 365,880 square miles are land area. Population in 1911,

2,527,292; in 1921, 2,933,662, or a gain of 16 per cent. In 1921, the rural population made up 41.8 per cent of the total as compared with 47.4 per cent in 1911. The male population numbered 1,481,890; females 1,451,772, in 1921. The leading cities, with their populations in 1921, were: Toronto, 521,893 (381,833 in 1911); Ottawa, the capital of Canada, 107,843 (87,062 in 1911); Hamilton, 114,151 (81,969 in 1911); London, 60,959 (46,300 in 1911).

**Industry.** While agriculture was the leading activity of the province, it was evident that by no means all its possibilities were yet exploited. Only 14,000,000 acres were under cultivation in 1923, and it was estimated that northern Ontario alone contained some 20,000,000 acres ready for the plow. Diversified farming, including dairying, was becoming the rule. In 1923, 10,296,961 acres were under field crops; the more important were hay and clover, 3,596,484 acres; oats, 2,967,417; wheat, 828,908; there were also considerable yields of barley, peas, corn, fodder corn, sugar beets, and other root crops. The total value was \$220,748,900 (\$196,220,000 in 1914). The growing attention accorded dairying and the meat industry was indicated in the increase of live stock. Cattle in 1922 numbered 2,838,087 and 2,601,086 in 1913; sheep in 1923 and in 1913 were 907,673 and 705,848. In 1922 there were 1053 creameries and factories which produced more than one-third of all Canada's butter, five-eighths of the total cheese production, and nine-tenths of the condensed and evaporated milk. The total value of these products was \$53,542,605 (about \$18,000,000 in 1910). Fruit culture, particularly apples, and the production of tobacco and sugar beets were rapidly spreading in the southern districts. In 1920, 20,114 acres were under tobacco; this fell to 8630 acres in 1923. Under sugar beets were 36,288 acres (22,450 acres in 1923). Ontario led the other provinces in wool production; the 1921 output was valued at \$6,953,824. In 1923, all agricultural products for the province were valued at \$400,511,000, the total for the Dominion being \$1,342,132,000. Farmers' organizations were widely prevalent, and many of them concerned themselves seriously with the problem of coöperative marketing. Such plans for the dairymen and fruit growers received the support of the government. Attention was also directed by an interested agricultural ministry to the necessity of creating coöperative credit societies. Other industries yielded: fisheries, in 1921, \$3,065,042, made up of fresh-water catches of herring, pickerel, pike, trout, and whitefish; forest products in 1921, \$26,193,280, made up of lumber, shingles, and lath. In the value of lumber cut away and in the making of lath, Ontario led all the other provinces. In the manufacture of pulp and the production of paper, Ontario was second only to Quebec. For 1920, \$59,647,000 in paper was turned out.

In mining activities, too, Ontario led all the other provinces. Figures for metallic production for 1922 were: gold, \$20,678,862; silver, \$31,280; nickel, \$6,158,993; copper, \$1,464,477; total, including all others, \$37,737,252. Non-metallic minerals, including natural gas, crude petroleum, structural materials, and clay products, yielded \$28,128,777. Grand total for 1922, \$65,866,029; for 1911, \$42,796,162. There were 91 mining companies incorporated in Ontario

with a capital of \$181,040,000. In 1922, the Ontario mineral output was 36 per cent of the total Canadian production. Under the active administration of the Hydro-Electric Commission, the extension of the use of water power for energy went on. By 1922, 214 municipalities, 47 townships, and 48 commercial institutions were being served. Revenues for 1922 were \$12,756,104, and costs of maintenance, etc., together with sinking fund, \$11,343,766; this left a surplus of \$1,412,338. (Revenues for 1913 were \$2,611,918.) The growth of this experiment in public ownership may be gathered from the following: 1910: horse power, 750; municipalities and townships, 10; 1923: horse power, 1,299,230; municipalities, etc., 214. Total assets of the Commission and the municipalities, in 1913, \$11,907,826; in 1922, \$55,126,834. Many projects were under way; one of the most important was the Chippewa Canal scheme which was to produce 600,000 horse power at a construction cost estimated at \$70,000,000. This plan, because of its ambitious nature, aroused discussion of a very controversial character.

Manufacturing prospered and Ontario continued to lead all the provinces. In 1921 there were 18,093 industrial establishments (8001 in 1910), capitalized at \$1,620,681,181, and employing 258,345 workers (238,817 in 1910). Costs of materials were \$744,433,905, and the value of the output was \$1,411,276,431 (\$579,810,225 in 1910). Leading industries were machinery, building construction, milling, packing, leather, boot and shoe production, hosiery, and rubber products.

**Trade and Communications.** In 1922 there were 10,881 miles of railway, as compared with 9000 in 1913. In 1919 there were 747,893 miles of telegraph wire (375,933 in 1912). In 1922-23 exports amounted to \$372,734,182 (\$132,756,532 in 1913) and imports to \$406,946,109 (\$301,651,328 in 1913).

**Government.** For 1913-14, revenues and expenditures were \$11,121,382 and \$11,819,311; by 1921-22, they had become \$39,725,370 and \$37,442,986. The Dominion subsidy and receipts from lands and forests had shown no increase, but new revenues were derived from succession duties and corporation taxes. The direct liabilities of the province by 1922 had risen to \$204,959,690. Under an act of 1921 the province was empowered to enter the banking business for the carrying of savings accounts and life insurance business. The purpose was the application of such funds toward agricultural credits. On Jan. 1, 1923, there was \$3,864,091 in deposits in the provincial banks. There were, in 1921, 7231 elementary and secondary schools attended by 632,123 pupils (518,605 pupils in 1911). Besides, there were 621 separate Catholic schools with an enrollment of 83,977. The 1921 budget bore \$5,919,055 for education (\$842,278 in 1912). Total expenditures on education, provincial and local, in 1912, \$13,492,108; in 1920, \$36,739,564. The provincial university, the University of Toronto, was attended by 5100 pupils in 1921-22. Women were granted the ballot in 1918 and permitted to stand for the provincial legislature. In the Dominion Parliament the representation remained the same: House of Commons, 82; Senate, 24.

**ORATORIO.** See MUSIC.

**ORAVA.** See TESCHEN, ZIPS, AND ORAVA QUESTIONS.

**ORDNANCE.** The War—greatest of international conflicts—had a correspondingly great effect on the development of implements of war, collectively called ordnance. The ingenuity of a nation fighting for existence, with its back to the wall, is stimulated to the utmost in developing means for overcoming the common enemy.

Science, engineering, and industry united in strenuous endeavors to make more effective the nation's man power by supplementing it with every mechanical improvement over man himself. Matériel, as contrasted with personnel, became to a greater and greater extent the determining factor in warfare—but another phase of the industrial revolution characteristic of the last century. Ordnance comprises all the things the soldier fights with, as distinguished from the material things that merely provide him with a more or less comfortable existence, such as food, clothing, shoes, shelter, fuel, means of transportation, etc. The ordnance equipment of a modern army includes about 1200 separate and distinct types of units, which in their assembly require the manufacture of 250,000 separate and distinct components.

The infantryman requires shoulder rifles by the million; cartridges for them by the billion; light one-man automatic rifles by tens of thousands for use in tight places calling for short concerted bursts of fire; heavy machine guns by thousands for playing the continuous leaden stream of the modern machine-gun barrage; sensitive sights and rugged tripods with elevation and traverse devices to insure placing the deadly hail with safety to his own advancing lines and maximum damage to the enemy; carts to carry his machine guns and water jackets to cool them; rifle grenades and rifle attachments to throw them; explosive hand grenades for defense against enemy raiding parties and for mopping up trenches on the offensive; gas grenades for making enemy dugouts uninhabitable and Thermit grenades for fusing the breech mechanism of captured enemy cannon and machine guns, continued possession of which is doubtful; bayonets and bolos, trench knives, helmets, periscopes, range finders, etc., not to mention the "baby" 37-mm. cannon for wiping out hostile machine gun nests and 3-inch trench mortars of simple yet most effective design.

The artilleryman requires field pieces by the thousand for divisional artillery—the "75" gun and its companion piece, the 105-mm. howitzer; heavy pieces for corps artillery—the 4.7-inch gun and its companion piece, the 155-mm. howitzer; high-powered, medium-calibre pieces for army artillery—155-mm. guns and 8-inch howitzers; 8-, 10-, 12- and 14-inch guns and 16-inch howitzers on railway mounts to reach the enemy's back area; 16-inch guns on permanent barbette emplacements for coastal defense; self-propelled caterpillar mounts for all calibres from the 75-mm. gun to the 240-mm. howitzer, capable of negotiating steep grades, accompanying its tactical unit at all speeds and ready to go into action immediately on arrival at the firing-point and depart to safer regions immediately its mission is accomplished. For the effective use of his weapons, the artilleryman requires vast quantities of ammunition: shrapnel, high-explosive shells and gas shells by millions of rounds, each an intricate mechanism in itself.

PHOTOGRAPHS. ORDNANCE DEPARTMENT, UNITED STATES ARMY

## UNITED STATES ARMY ORDNANCE

1. Various Types of 6-inch Projectiles
2. Projectile (Weight 2340 Pounds) and Powder Charge (850 Pounds) for 16-inch United States Army Gun for Range of 55,000 Yards
3. Types of Drop Bombs

The aviator requires stripped machine guns speeded up to 1400 shots per minute, adjusted with inconceivable nicety to shoot between the rapidly revolving blades of his propeller; electric heaters to prevent freezing of the lubricating system of his gun mechanism at high altitudes; shot counters to indicate the available amount of ammunition remaining; armor-piercing bullets for use against armored airplanes or in low flying action against tanks; incendiary bullets to ignite the gas contents of enemy captive balloons and dirigibles; tracer bullets to assist in correcting his aim; ingenious sights to correct automatically for the relative speed and direction of his own plane and his target; airplane bombs, from the small 25-pound fragmentation type for use against enemy troops, to the 4000-pound bomb for attack on battleships or fortified enemy positions; bomb sights to determine the proper instant for release, and release mechanisms to carry his huge instruments of destruction with safety to himself and to release them accurately in order to inflict the most damage on the enemy.

To supplement the waves of attacking infantry, light two-man tanks equipped with a single machine gun; heavy tanks equipped with 37-mm. cannon and four machine guns—urged irresistibly forward by 500-horse power Liberty engines crossing trench systems, shell craters and other obstacles by means of its powerful caterpillar track-laying mechanism—are needed.

Pyrotechnics are drafted into war service to obtain communication among the various elements of attacking waves, to smoke-screen day-

light raids, to illuminate the immediate foreground and thereby prevent surprise night attacks, as well as to guide night-flying airmen to a safe landing on an otherwise unilluminated landing field.

The cost of equipping a modern army with necessary amounts of up-to-date ordnance can be sensed from the estimates of 12½ billion dollars made for the equipment of the first five million American troops called to the colors during the War. The impetus given to ordnance design by that conflict has continued, inasmuch as the length of time in which the United States was actively in the War did not permit the full development of many promising devices. While accurate information in regard to advances in the field of ordnance design by other armies is not available, it can safely be assumed that they have made at least as much progress in this direction as a recent announcement indicates has been made in the United States Army. A general idea of the relative effectiveness of ordnance used during the War and that developed since the Armistice can be gained from the statement that in the United States Army, the new 75-mm. gun has twice the range of the French "75" used in 1918; the new 4.7-inch gun has two and one-half times the range of the pre-war model and fires a heavier projectile; the new 155-mm. gun outranges the French gun of the same calibre used during the War, by nearly five miles; the largest aerial bomb effectively used during the War weighed only 400 pounds; the latest successful development weighs 4000 pounds

and contains over a ton of explosive; the 50-calibre super-machine gun shoots a bullet weighing four times as much as the 0.30 calibre Browning and has three times the range of the weapon used in the War; the latest caterpillar mount for divisional artillery has attained a maximum speed of 30 miles on good roads, as contrasted with the 8 or 10-mile per hour maximum of the War. See ARTILLERY; EXPLOSIVES; GUNS, NAVAL; PROJECTILE; SMALL ARMS; TRENCH WARFARE MATERIAL; STRATEGY AND TACTICS.

**ORE DEPOSITS.** See GEOLOGY, ECONOMIC; ALSO GEOLOGY.

**OREGON.** Oregon is the ninth State in size (96,699 square miles), and the thirty-fourth in population; capital, Salem. The population increased from 672,765 in 1910 to 783,389 in 1920, a gain of 16.4 per cent. The white population increased from 655,090 to 769,146, while the Indian population decreased from 5090 to 4590; the Chinese decreased from 7363 to 3090, and the Japanese increased from 3418 to 4151. The negro population showed an increase of from 1492 to 2144; and the native white, from 552,089 to 666,995. The foreign-born white population decreased from 103,001 to 102,151. Both urban and rural populations mounted during the decade: the former from 307,060 to 391,019; the latter from 365,705 to 392,370. The growth of the principal cities was as follows: Portland (q.v.), from 207,214 in 1910 to 258,288 in 1920; Astoria, 9599 to 14,027; Salem, 14,094 to 17,679.

**Agriculture.** As Oregon is one of the important grain-growing States, agricultural conditions were affected in the decade 1913-23 by the fluctuations in price and production of grains during the War and post-war period. This situation is treated in detail under AGRICULTURE, CORN, WHEAT, BARLEY, etc. While the population of the State increased 16.4 per cent in the decade, the number of farms increased 10.3 per cent (from 45,502 in 1910 to 50,206 in 1920); the acreage in farms increased from 11,685,110 to 13,542,318; and the improved land in farms, from 4,274,803 to 4,913,851 acres. The percentage of total land area in farms increased from 19.1 in 1910 to 22.1 in 1920; the percentage of improved land in farms, from 7 to 8 per cent. The total value of farm property apparently increased 55 per cent in the decade, from \$528,243,782 to \$818,559,751; the average value per farm, from \$11,609 to \$16,304. In interpreting these values and all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 50,206 farms in 1920, 39,863 were operated by owners, 916 by managers, and 9427 by tenants. The corresponding figures for 1910 were 37,796, 847, and 6859. White farmers in 1920 numbered 49,633, compared with 44,875 in 1910; colored farmers numbered 573, compared with 627. Farms free from mortgage in 1920 numbered 18,077, and those under mortgage, 17,843; in 1910, 24,855 farms were free from mortgage, and 12,632 were mortgaged. The total number of cattle in 1920 was 851,108; in 1910, 725,255. Of these, 280,411 in 1920 were dairy cattle; in 1910, 172,550. The number of hogs increased from 217,577 to 266,778; the number of sheep decreased from 2,699,135 to 2,002,378. The estimated produc-

tion of the principal crops in 1923 was as follows: corn, 2,344,000 bushels; spring wheat, 4,565,000 bushels; winter wheat, 21,725,000 bushels; oats, 10,773,000 bushels; barley, 3,234,000 bushels; potatoes, 5,852,000 bushels; hay, 2,103,000 tons; and apples, 7,253,000 bushels. Comparative figures for 1913 are: corn, 598,000 bushels; wheat, 15,717,000; oats, 15,228,000; barley, 4,200,000; potatoes, 6,750,000; and hay, 1,732,000 tons.

**Mining.** The mineral resources of Oregon are not fully developed. Among the minerals produced are sand and gravel, gold, copper, silver, cement, and stone. The production of gold, copper and silver during the decade 1914-24 was as shown in the table. In addition to

MINERAL PRODUCTION IN OREGON

| Year      | Gold<br>Valued at | Silver<br>Fine Ounces | Copper<br>Pounds |
|-----------|-------------------|-----------------------|------------------|
| 1914..... | \$1,591,461       | 142,552               | 39,248           |
| 1916..... | 1,902,179         | 231,342               | 3,581,886        |
| 1918..... | 1,270,465         | 107,323               | 2,451,016        |
| 1920..... | 1,017,490         | 82,743                | 2,355,276        |
| 1921..... | 822,034           | 42,120                | 174,800          |
| 1922..... | 631,568           | .....                 | .....            |

the minerals mentioned above, the State also produces mineral waters and a small quantity of natural gas. The total value of the mineral products in 1921 was \$5,199,803, compared with \$5,496,253 in 1920; \$3,962,822 in 1919; \$4,191,740 in 1918; and \$3,331,132 in 1914.

**Manufactures.** Oregon is not one of the most important industrial States, but its manufacturing activities are constantly increasing. In 1920 there were in the State four cities with more than 10,000 inhabitants, forming 38.4 per cent of the total population of the State; and these, in 1919, reported 60.4 per cent of the State's manufactured products. There were in the State 2246 manufacturing establishments in 1909; 2320 in 1914; 2707 in 1919. Persons engaged in manufacture numbered 34,722, 35,449, and 68,005, and the capital invested amounted to \$89,081,873, \$139,500,379, and \$237,254,736 in those years. The value of products in 1909 amounted to \$93,004,845; in 1914, \$109,761,951; and in 1919, \$366,782,627. The increase in value of products in 1914-19 was in great measure due to changes in industrial conditions brought about by the War and cannot be taken as an index of the growth of manufactures during that period; but the increase in the average number of persons employed clearly shows steady growth in the manufacturing activities of the State. The first industry in point of value of products is that relating to lumber and timber products: in 1909, valued at \$30,200,000; 1914, \$30,920,000; and 1919, \$95,264,000. Flourmill and gristmill products rank second in this respect: in 1909, \$8,891,000; 1914, \$11,193,000; 1919, \$42,550,000. Foundry and machine-shop products, in third place, were valued, in 1909, at \$3,135,000; in 1914, \$3,823,000; and in 1919, \$31,689,000. Slaughtering and meat packing, next in order, had products valued in 1909 at \$5,880,000; in 1914, \$7,487,000; and in 1919, \$15,868,000. The chief manufacturing city is Portland; other less important are Astoria, Eugene and Salem. In 1909, there were in Portland 649 manufacturing establishments, with a product valued at \$46,861,000; 837 in 1914, with \$55,697,000; and 846 in 1919, with \$196,380,000.

**Education.** Oregon is one of the most progressive States in educational matters, and the high standard of efficiency in its educational system was maintained in the decade 1914-24. A new compulsory education law was adopted by the people at the general election held in November, 1922, by the terms of which all children between the ages of 9 and 15 were required to attend school for a term or period of not less or more than the number of months the public school holds session in the district in which their parents or guardians reside. The history of the State is required to be taught in the schools, and there are also courses in moral instruction and physical education. In 1918, the Legislature enacted a physical education law making it mandatory that all pupils in the elementary and secondary schools receive physical training for an average of at least 20 minutes a day. Progress was made during the decade in the rural schools and in nearly every county of the State consolidation was under way. The total number of consolidations for elementary schools for 1923 was 77, with an enrollment of 5585 pupils. In 1914, the State adopted a uniform system of standards for country and village schools. A movement for junior high schools developed. The Legislature of 1919 established a State Board for Vocational Education and substantial progress was made in this field, in agriculture, home economics, and technical training. The total enrollment in the elementary schools in 1920-21 was 160,924; in the high schools, it was 29,235; and the expenditure for educational purposes was \$14,783,718. Illiteracy in the State decreased from 2.2 per cent in 1910 to 1.8 per cent in 1920; in the native white population it remained at 0.5 per cent; among the foreign-born white, it decreased from 5.9 to 5.4 per cent; among the Negro, it increased from 3.7 to 5.5 per cent.

**Finance.** For finance, see STATE FINANCES.

**Political and Other Events.** The Democratic and Republican parties alternated in political control of important offices in Oregon in the decade 1914-24. In 1914 elections were held for governor and for United States Senator. The Republican candidate for governor, James Withycombe, was elected; the Democrats re-elected Senator Chamberlain. In this election an amendment to the constitution, adopted by a large majority, prohibited the sale or manufacture within the State of intoxicants, but permitted importations. An amendment abolishing capital punishment was also adopted, but six years later capital punishment was restored by vote of the people. In a special election held in January, 1915, Kathryn Clark was elected State Senator; she was the first woman to fill this position. Women participated in the elections for the first time in 1916. Minor State officers only were chosen. In the presidential voting of this year, Charles E. Hughes received 126,968 votes; Woodrow Wilson, 120,125. The prohibition section of the constitution adopted in 1914 was in this year amended to prohibit importation of intoxicants into the State. An amendment empowering the governor to veto single items in appropriation bills was also carried. On June 7, 1916, the Columbia River Highway, one of the greatest scenic roadways ever constructed, was dedicated. In 1917 the policy of expending automobile license revenues on permanent highway construction was adopted. Through capitalization of these

revenues, more than \$40,000,000 was expended on pavement of trunk highways. Elections were held in 1918 for governor and United States Senator. Governor Withycombe was re-elected, and Charles L. McNary, who had been appointed United States Senator on the death of Senator Lane, was elected to the Senate. Governor Withycombe died in office, Mar. 3, 1919, and was succeeded by Secretary of State Ben W. Olcott. There was an election in 1920 for United States Senator. Senator Chamberlain, a candidate for reelection, was victoriously opposed by Robert N. Stanfield, Republican. In the presidential voting of this year, Warren G. Harding received 143,592 votes; James M. Cox, 80,019. The Democrats in 1922 elected their candidate for governor, Walter M. Pierce, who defeated Governor Olcott, Republican. At this election the voters adopted a compulsory school law which required that children over 8 and under 16 years of age be sent to the public schools during the school year. This law was framed with a view of suppressing private and parochial schools. It was sponsored by the Scottish Rite Masons and was supported by the Ku Klux Klan. The law was declared unconstitutional by the United States District Court, Mar. 31, 1924. Governor Pierce was inaugurated in January, 1923. In his message to the Legislature he recommended reductions in the State appropriations and called for a general revision of the system of taxation.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are given below. In 1915 a law was enacted, in accordance with the vote of the people in 1914, to prohibit the sale or manufacture of liquor in the State; but it permitted importations in limited quantities to individuals. In 1917, at the request of Secretary Lansing, the Legislature withdrew certain anti-alien bills designed to prevent Japanese from owning land in the State. Provision was made for a rural credit system and for the establishment of county tuberculosis sanatoria and hospitals. This Legislature also passed a "bone-dry" prohibition bill and amended the laws relating to courts. Further amendments in the laws relating to the judiciary were made in 1919. This Legislature also created a legislative reference service and passed measures forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence to the government. In 1921, the Legislature provided for a State Board of Aviation; created a State Board of Control and Budget Commission, and made provision for the Americanization of the foreign-born. It adopted, subject to approval by the people, which was thereafter given, optional cash or loan bonuses to veterans of the War. In 1923 the Legislature passed an income tax law and an eight-hour law for lumber workers. It also established a Judicial Council with the Chief Justice as chairman. At this session measures were passed against the holding of land by aliens, and a law was enacted requiring voters to be able to read and write English. The sale of narcotics was made a felony.

**OREGON, UNIVERSITY OF.** A coeducational State institution at Eugene and Portland, Ore., founded in 1872. The Schools of Education, Physical Education and Sociology were founded between 1914 and 1924. During the period the enrollment increased from 1765 to approximately 2600, of whom 1500 were men and 1100

women. An extension division was organized which in 1924 gave instruction to over 4000 pupils. The summer sessions held in both cities enrolled between 800 and 900. The campus enrollment more than quadrupled during the 10 years, increasing 54 per cent in the fall of 1919. The income of the university, which was largely derived from millage taxes, amounted to approximately \$820,000 in 1923-24; the value of the buildings, including the dormitories, was estimated at \$1,370,000. The library increased from 53,000 to 130,170 volumes. Women's Hall, erected by funds raised by popular subscription, contained, besides the social hall in one wing, the Murray Warner collection of Oriental art of the Oregon Museum of Fine Arts, which was given to the university during the period. Other buildings erected included McKenzie Hall, the School of Medicine building, the commerce building, the women's dormitory, and the School of Education group. President, Prince L. Campbell, LL.D.

**OREL, ANTON** (1881- ). An Austrian reformer and author (see Vol. XVII). He wrote on religious and economic subjects and published the following works: *Die Grundprobleme der Kultur: Das Weltanlitz, Die Glaubensfrage* (1919); *Kapitalismus und Christliches Eigentum* (1920); *Land und Haus der Städter* (1920); and *Freie Bauern*.

**ORGANIC CHEMISTRY.** See CHEMISTRY, ORGANIC.

**ORGANIZATION, MILITARY.** See ARMIES AND ARMY ORGANIZATION.

**ORGANOTHERAPY.** See SECRETIONS, INTERNAL.

**ORIENTAL PEACH MOTH.** See ENTOMOLOGY, ECONOMIC.

**ORLANDO, VITTORIO** (1860- ). An Italian statesman. He began his career as a professor of law, was elected deputy for Partinico in Sicily in 1898, and was minister of education in the Giolitti-Tittoni cabinet of 1903-05 and of justice in the Giolitti cabinet of 1907-09, and again under Salandra in March, 1914. He favored Italy's intervention in the War when others of his party were against it, but later when he was minister of the interior under Boselli he was blamed for not preventing the spread of defeatist propaganda. On the resignation of Boselli in 1917 he formed a new cabinet and was prime minister at the time of the Peace Conference, but his cabinet fell in 1919 owing to his failure to secure a favorable settlement of Italian claims in Paris. He was elected president of the Chamber in December, 1919. When Mussolini made up the lists for the election of deputies early in 1924, Orlando was one of a few non-Fascists to appear on it. See PEACE CONFERENCE AND TREATIES; ITALY, *History*.

**ORNSTEIN, LEO** (1895- ). An American pianist and composer, born at Krementchug, Russia. Until 1906 he studied at the Petrograd Conservatory. He then came to New York and completed his education at the Institute of Musical Art under Bertha Feiring Tapper. His debut in 1911 aroused great expectations, for he showed himself an artist of splendid technical equipment and keen insight. But as early as his second season he discarded acknowledged musical standards and made up his programmes from the works of the extreme futurists, whom he also joined unreservedly as a composer. His numerous compositions are almost exclusively

for piano or chamber ensembles. His main ambition is to outdistance Schönberg and Stravinsky. In his own words he is "the exponent of a system of unparalleled originality and boldness of procedure. . . . I am not concerned with form or with standards of any nature." Consult F. H. Martens, *Leo Ornstein: The Man, His Ideas, His Works* (New York, 1917).

**ORPEN, SIR WILLIAM** (1878- ). An Irish painter, born near Dublin. He entered the Dublin Art School at the age of 11 but owed his chief training to the radical Slade School in London. In 1899 he first exhibited at the New English Art Club, in which a powerful portrait of Augustus John brought him membership in 1900. He has continued one of the pillars of this modernist organization. In 1904 he was elected to the Royal Hibernian Academy and in 1910 became an Associate of the Royal Academy. Orpen is a very versatile painter, brilliant in technique and facile in execution. His color is bright and strong, his treatment of light especially successful, his design striking, sometimes bizarre. He is thoroughly Irish in spirit, often whimsical and satiric, and delights in Irish figure subjects, such as "The Irish Volunteer," to cite a well-known example. A specialty of his is so-called "portrait interiors," in which the sitter is represented in the intimate surroundings of his home, elaborately depicted, as in the portraits of the Hon. Percy Wyndham and the Countess of Balcarras. Two whimsical portraits of the artist himself in studio surroundings are in the Metropolitan Museum, New York City, and the Carnegie Institute, Pittsburgh. As a portraitist he ranks second only to Sargent. Some of his portraits, those commissioned, are more conventional in style; others, in which he attacks given technical problems, are much freer. The latter include several paintings of his wife, in one of which she is represented washing the laundry, and many of himself, such as "The Artist at the Front" and "The Man from Arran," both painted during the War, when he was official British artist. As such, he painted portraits of the chief commanders, Sir Douglas Haig and General Foch, and other subjects, such as "Poilu and Tommy," "Bombing at Night," and "Dead Germans in a Trench." In 1918 he presented a number of his war paintings to the nation. In 1919 he exhibited two large pictures of the Peace Conference at Versailles, and a version of a similar subject in 1923 caused consternation by its bitter satire. His more recent awards included the gold medal of the International Exhibition at Pittsburgh and the first Carnegie prize.

**ORTHOGENESIS.** See ZoöLOGY.

**O'RYAN, JOHN F.** (1874- ). An American lawyer and soldier, born in New York City, and educated at the College of the City of New York and the law department of New York University. In 1898 he was admitted to the bar. He was actively interested in military affairs and was a member of the 7th Regiment of New York, rising to the rank of major of field artillery. In 1912 he was appointed major-general of the New York National Guard. At the United States entrance into the War in 1917, he was appointed by President Wilson Major-general in the National Army, and from 1917 to 1919 he commanded the 27th Division of the American Expeditionary Forces in Belgium and France. This regiment participated in some of

OF THE  
UNIVERSITY OF ILLINOIS

the most severe fighting of the War. He received decorations from foreign governments and the American Distinguished Service Medal. He was appointed a member of the Public Service Commission of New York in 1922. In 1924 he conducted as counsel the investigation into the conduct of the Veterans' Bureau.

**OSBURN, RAYMOND** (1872- ). An American zoölogist, born at Newark, Ohio, and educated at Ohio State University and Columbia University. He was instructor in biology at Starling Medical College (1898-99); professor of biology at the Fargo (N. D.) College (1899-1902); instructor at the New York High School of Commerce (1903-07); instructor in zoölogy (1907-10) and assistant professor (1910-15) at Barnard College; professor of biology at Connecticut Women's College (1915-17); and professor of zoölogy at Ohio State University (1917- ). Professor Osburn published taxonomic papers on the bryozoa and was for a number of years on the investigation staff at the United States Bureau of Fisheries Laboratory at Woods Hole, Mass.

**O'SHAUGHNESSY, EDITH COUES** (Mrs. NELSON O'SHAUGHNESSY) (?- ). An American writer, born in Columbia, S. C., and educated under private tutors. In 1901 she married Nelson O'Shaughnessy of New York, who was in the diplomatic service. While the latter was chargé d'affaires in Mexico in 1916 she made careful notes of political and social affairs which enabled her to write *A Diplomat's Wife in Mexico*, an enlightening and entertaining account of stirring events in that country. This was followed by *Diplomatic Days in Mexico* (1917); *My Lorraine Journal* (1918); *Alsace in Rust and Gold* (1919), and *Intimate Pages of Mexican History* (1920).

**OSLER, SIR WILLIAM** (1849-1919). A physician and author (see VOL. XVII). During the period from 1914 to the time of his death, Dr. Osler wrote two major works, *A Concise History of Medicine* (1919) and *The Evolution of Modern Medicine* (1921). Since his demise, extracts from his works have been edited by C. N. B. Camac with the title *Counsels and Ideals* (1921).

A fifth edition of the essays entitled *Æquanimitas* appeared in 1923, and the ninth edition of Osler and McCrae's *Principles and Practice of Medicine* in 1920.

**OSTWALD, WILHELM** (1853- ). A German chemist and philosopher (see VOL. XVII). He was editor of *Der Monist* (1912-15) and later published *Der Farbenatlas* (1917); *Die Farbenlehre* (1918-19); *Die Harmonie der Farben* (1918); *Goethe, Schopenhauer, und die Farbenlehre* (1918); *Die Farbkörper* (1919); *Die Farbschule* (1919); and *Einführung in die Farbenlehre* (1919). He lectured at Columbia and Harvard Universities and founded a laboratory for color study in Dresden in 1920.

**OTIRA TUNNEL.** See TUNNELS.

**OVERMAN, LEE SLATER** (1854- ). An American legislator (see VOL. XVII). He was reelected to the Senate for a third term in 1914. This was the first senatorial election by a direct vote of the people of the State. In 1920 he was reelected for a fourth term. He was one of the most conspicuous of the Democratic members of the Senate.

**OVERTON, GRANT M (ARTIN)** (1887- ). An American writer, born at Patchogue, N. Y. He studied at Princeton University from 1904 to 1906 and for several years was on the staffs of newspapers in New York, Denver, and San Francisco. After a trip at sea before the mast, he became an editorial writer for the *New York Sun* in 1910 and was later its literary editor and contributor to several magazines. His books include *The Women Who Make Our Novels* (1918); *Mermaid* (1920); *World without End* (1921); and *The Answerer*, a novel on the life of Walt Whitman (1921).

**OWEN, ROBERT LATHAM** (1856- ). An American legislator (see VOL. XVII) and United States Senator from Oklahoma. He first took his seat in 1907 and was reelected in 1912 and again in 1918 for the term expiring Mar. 3, 1925. He was a member of several important committees including that of appropriations, banking, and currency.

**OXYGEN.** See CHEMISTRY.

**OZONE.** See CHEMISTRY.

## P

**PACIFIC OCEAN ISLANDS.** The more important groups of islands in the Pacific Ocean are given below. For American possessions, see **PHILIPPINE ISLANDS**, **HAWAII**, **GUAM**, **SAMOA**. For the Yap agreement, see **YAP**. For a discussion of the political problem of the Pacific see **WASHINGTON CONFERENCE**.

**Caroline and Pelew Islands.** A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. The islands were divided into two groups: (1) the Eastern Carolines with Ponapé as the centre; and (2) the Western Carolines with Yap as the centre. The population reported (1921) was made up of 644 Japanese, 14 Europeans, 15 Chinese, and about 40,000 natives. Copra was the chief export. See **YAP** for the dispute between the United States and Japan over the disposition of this island.

**Cook Islands.** A group in the Southern Pacific belonging to New Zealand. Total area, 280 square miles; population, in 1921, 13,209. In 1915 the laws for the islands were consolidated and a member of the New Zealand Executive Council was made minister of the Cook Islands. In 1921, imports totaled £139,313 and exports £86,082. Trade was largely with New Zealand, exports being mainly fruits. Copra was sent to the United States (£11,841 in 1921). Revenues for 1921-22 were £22,011 and expenditures £32,422. A wireless station was erected on Rarotonga, the chief island. Many of the islands were leased to private coconut companies for exploitation. The Niue islands had a population of 3750 and were concerned largely with copra production (exports in 1920 were about £40,000).

**Fiji Islands.** A group of 250 islands in the Southern Pacific, constituting a British crown colony. The largest are Viti Levu and Vanua Levu. Total area, including Roturna (a dependency), 7038 square miles; population (1921), 157,266, made up of 3878 Europeans, 84,475 Fijians, 60,634 Indians, 910 Chinese, 2781 half-castes. In attendance at the Methodist churches in 1921 were 78,944 natives. The government was aiding 50 schools out of a total 1000 on the islands. In 1921, there were under cultivation by Europeans and Indian settlers 45,800 acres of coconuts, 68,500 acres of sugar cane, 11,300 acres of rice. Bananas, maize, tobacco, rubber, beans, were other crops. Exports in 1913 were £1,425,940; in 1921, £2,457,851 (sugar, £2,053,000). Imports for the same years were £903,968 and £1,509,732. The trade was carried on largely with British possessions. Revenues and expenditures for 1913 were £266,037 and £258,792; for 1921, £569,722 and £752,038. There was a public debt in 1922 of £350,000 (£93,515 in 1911). Wireless telegraph stations were erected at Suava, Labasa, Taveuni, and Savusavu. The governor of Fiji was also

high commissioner for the Western Pacific.

**Gilbert and Ellice Islands Colony.** These islands were annexed as a colony to Great Britain in November, 1915. The Gilbert Islands are on the equator and have an area of 166 square miles, and a population of 30,000. The Ellice Islands have an area of 14 square miles, and a population of 3500. Ocean Island, the colony headquarters, had a population of 1000. A wireless station here maintained telegraph communication with the outside world via Fiji and Australia. The very rich phosphate deposits on the island were, after 1921, worked by the British Phosphate Commission. Other islands in the colony were the Union or Tokelau group, and the American Islands. Of the latter, Christmas Island was the largest atoll in the Pacific. It was leased in 1914 to the Pacific Coconut Plantations, Ltd., for exploitation; population, 2 Europeans and 40 Tahitians. Fanning and Washington Islands, also in this group, were being worked by a coconut company. Total revenues for the whole colony for 1920-21 were £54,079 and expenditures £45,380. The trade in 1919-20 amounted to £129,788 for imports and £213,042 for exports (phosphates, £158,751; copra, £54,010).

**Marianne or Ladrone Islands.** A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. Native population numbered 3368 and the Japanese, 1754. Guam (q.v.), the largest island, belonged to the United States.

**Marquesas Islands.** A group of islands in the Western Pacific belonging to France and administered from Papeete. Total area, 480 square miles; population, 2300, of whom 168 were white. Hivaoa and Nukahiva were the principal islands.

**Marshall Islands.** A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. The group is made up of two chains, viz., Ratak (13 islands) and Ralik (11 islands). The population consisted of 102 Japanese, 5 Europeans, and 8901 natives. Coconut-palm plantations covered 1275 hectares, and the chief export was copra.

**Nauru.** An island in the Western Pacific just south of the equator, formerly part of German New Guinea, but since 1920 administered by Great Britain under a mandate from the League of Nations. It is a circular atoll only 12 miles in circumference. Population in 1922: 110 Europeans, 514 Chinese, 1113 Nauruans, 392 other South Sea Islanders. The important phosphate deposits were placed in the hands of the British Phosphate Commission representing the governments of Great Britain, Australia, and New Zealand. Costs of administration, if ordinary revenues did not suffice, were to be met out of the phosphate sales. Phosphate exports increased from 101,267 tons in 1917 to 236,435 tons in 1921. Imports were

valued at £140,302 in 1921. Of the phosphate mined a royalty of sixpence per ton went to the Commission and a royalty of threepence to the native landowners. Of the latter, one penny per ton was paid into a trust fund held for all the Nauruans. The German wireless station, though dismantled by the Germans, was soon restored. The island fell in September, 1914, before a British naval force and from 1915 on was occupied by a civil administration.

**New Caledonia.** A French colony in the Western Pacific consisting of the island of New Caledonia (area, 7650 square miles) and four groups of island dependencies. Population (1921), 47,500, made up of 13,138 free settlers, 5671 of convict origin, and 28,075 Melanesians and Polynesians. Nouméa, the capital, had 10,053 inhabitants of whom 6502 were free (1921). Leading products were nickel, chrome iron, manganese and cobalt (mineral export in 1921, 5,527,160 francs), as well as copra, hides, and preserved meats. Local blast furnaces produced 4486 tons of nickel valued at 5,819,300 francs. Total exports for 1913, 1920, 1921 were 15,838,405 francs, 43,043,449 francs, 26,676,000 francs. Imports for 1921 were 48,565,000 francs. France, on an average, took 8 per cent of the exports and sent 18 per cent of the imports. The budget for 1922 balanced at 8,831,925 francs. The Loyalty Islands, which belong to this group, possessed rich guano deposits; on the Wallis and Horn Islands, copra was the leading product. The latter were formed into a colony in 1913.

**New Hebrides.** These were administered jointly by French and British officials. Area, 5500 square miles; population (1921), 60,000, of whom 677 were French and 226 British. Several French and British trading companies operated here. Imports in 1920 were £159,174; exports (maize, copra, coffee, cotton, sandalwood, cocoa), £245,187. The French reported a total trade of 13,051,527 francs in 1921, of which 9,768,625 francs represented the French activities and 3,282,802 francs the British. Inter-course was mainly with Sydney and Nouméa (New Caledonia). The joint revenues in 1921 amounted to £25,892, and the joint expenditures, £18,947. Ownership of land was divided as follows: French, 617,000 hectares; British, 129,000 hectares. Beginning with 1919 the islands became the seat of a strong agitation for the termination of the condominium (1906) and accession by France. The question was discussed at the British Imperial Conference in 1921, and again later in the year, when an offer was made by a French private company to buy out the British rights. Complaints were frequent, particularly over the cumbersome methods of administering justice. However, the condominium was renewed by the protocol of London on Mar. 18, 1922.

**Norfolk Island.** An island in the Southern Pacific, a dependency of Australia. Area, 13 square miles; population (1921) 717. Up to 1914 it was governed from New South Wales. Imports in 1920-21 were £22,673 and exports £13,091. To encourage the fish industry the Commonwealth granted an annual subsidy of £1000 (for three years).

**Phoenix Group.** This was made up of eight islands with a total area of 16 square miles, and a population of 59. They belonged to Great Britain but were leased to a trading company for coconut planting.

**Samoa.** A group of islands in the Western Pacific, formerly a German possession, but since 1920 administered by New Zealand under a mandate from the League of Nations. The group, comprising the large islands of Savaii and Upolu and several adjacent islets, was given the name Territory of Western Samoa. Area, about 1300 square miles; population (1922), 2074 Europeans, 33,953 native Samoans, 1547 coolie laborers, 217 other islanders. Education was in the hands of the London Missionary Society, the Methodist Mission, the Catholic Mission, and the Latter Day Saints' Mission. Imports for 1921 were £408,892 and exports £241,539 (copra and cocoa beans largely). Revenues for 1921-22 were £135,569 and expenditures £137,181. The United States took most of the copra exported. New Zealand forces occupied the islands on Aug. 29, 1914. In 1918, 7500 natives died from influenza, the region being one of those that suffered most severely. A wireless station was erected at Apia, the Territory's port. The local administration made provision for a nominated legislative council in which native Samoans might have seats. For the American Samoan islands, see article SAMOA.

**Society Islands.** A group in the Western Pacific belonging to France. Total area, 1650 square kilometers; population, 21,543. Tahiti, the most important island, has an area of 1042 square kilometers, and a population of 11,378, of whom 2903 were white. Papeete, on Tahiti, was the seat of administration of the French Establishments in Oceania, and possessed a wireless station. It had 4601 inhabitants of whom 2126 were white. The chief industries of Tahiti were the preparation of copra, sugar, and rum. Vanilla, coffee, and cacao were again being cultivated. Other islands belonging to the Society group were Moorea (area, 132 square kilometers; pop., 1616) and Iles-sous-le-Vent (area, 363 square kilometers; pop. 6689).

All the French Establishments (i.e. Society Islands, Marquesas, Tuamotu, and Tubua groups) had a total area of 4395 square kilometers, and a population in 1921 of 31,655, made up of 2655 French, 2687 other whites, 743 Chinese, and the rest natives. Leading exports were copra, mother-of-pearl, hides, coconut oil, phosphates, coffee, vanilla, cotton. Exports in 1913, 1920, 1921 were valued at 11,554,507 francs, 24,360,900 francs, and 15,000,000 francs. Imports in 1921 were 14,210,000 francs. In 1920 only 4 per cent of the imports came from France, and only 6 per cent of the exports went to the mother country. The budget for 1922 balanced at 6,500,000 francs; in 1911 it had been 1,745,000 francs. Some 5000 lives were lost in these islands in the influenza epidemic of 1918.

**Solomon Islands.** A British protectorate in 8°S. and 160°W., made up of 15 large islands and the following groups: Lord Howe group, Santa Cruz Islands, Mitre Islands, and the Duff or Wilson group. Total area, 11,000 square miles; European population (1919), 675; native population, 150,000; Asiatics, 75. Coconuts were cultivated over 30,000 acres; other products were rubber, fruits, copra (8160 tons in 1919-20). Imports for 1921-22 were £251,564; exports (mainly copra), £182,887. Revenues for 1921-22 were £56,433; expenditures, £45,451. The islands in the group owned by Germany became part of the Australian mandate territory of New Guinea (q.v.) after the War.

**Tonga or Friendly Islands.** A group of

islands in the Western Pacific, forming a British protectorate. Total area, 385 square miles; population (1919 estimate), 23,562, made up of 22,689 Tongans, 250 half-castes, 247 other Pacific islanders, 376 Europeans. The natives were Christians, belonging to the Free Church of Tonga, Methodist, and Catholic Churches. Copra was the chief product, more than half of it going to the United States. Imports and exports each averaged £170,000 after the War. Exports in 1920 amounted to £380,157. Revenues in 1920-21 totaled £91,000 and expenditures £66,000. A wireless station at Nukualofa was in touch with Samoa and Fiji. The reigning sovereign, Queen Salote, came to the throne in 1918.

**Tuamotu Islands.** A group in the Western Pacific belonging to France and administered from Papeete. Total area, 55 square kilometers; population, 2378, of whom 82 were white. Makatéa, the principal island, had important phosphate deposits. In the Gambier Islands, pearls and mother-of-pearl were the leading products.

**Tubuai Islands.** A group in the Western Pacific belonging to France and administered from Papeete. Area, 124 square kilometers; population, 2301, of whom 66 were white. Coffee was being grown here.

**PACK, CHARLES LATHROP** (1857- ). An American forester and economist, born at Lexington, Mich., and educated in the public schools at Cleveland. He studied forestry in Germany. For several years he explored forests in Canada, the Northwest, Louisiana, and Mississippi. He was a director and official in many important financial institutions and from 1917 to 1919 president of the National War Garden Commission. He was president also of the American Forestry Association from 1916 to 1920 and of the National Conservation Congress in 1913. He was chairman of the French Agricultural Committee of the American Commission for devastated France. For his services in France he was awarded several medals. He wrote much on agricultural subjects, including *The War Garden Victorious*, *Memorial Trees*, and *Roads of Remembrance*.

**PACKING INDUSTRY.** See **LIVE STOCK**.

**PADELFORD, FREDERICK MORGAN** (1875- ). An American educator, born at Haverhill, Mass., and educated at Colby College, Yale, and Oxford. He was for one year a fellow at Yale and from 1889 to 1901 was professor of English at the University of Idaho. In the latter year he became professor of English at the University of Washington, and in 1920 dean of the Graduate School at that university. He was a member of several societies and author of *Old English Musical Terms* (1900); *Early Sixteenth Century Lyrics* (1906); *Samuel Osborne, Janitor* (1913); *George Dana Boardman Pepper, a Biographical Sketch* (1914); and *The Poems of Henry Howard, Earl of Surrey* (1920). He also translated and edited many English texts and contributed to *The Cambridge History of English Literature* and to European and American magazines.

**PADEREWSKI, IGNACE JAN** (1860- ). A Polish pianist and composer (see Vol. XVII). On May 9, 1917, he made at the Metropolitan Opera House, on the occasion of a gala performance in honor of General Joffre, his farewell appearance, which he declared was to close forever his pianistic career. He then plunged into

the midst of the political turmoil. At the beginning of the War and after, he had appeared at his concerts also as a political orator of no mean ability and contributed the greater part of the proceeds to the cause of Poland. After 1917 he devoted his entire time and energy to recruiting from among the Poles in the United States an army of 100,000 men and 50 officers, which subsequently constituted the greater part of the Polish Army in France. As soon as circumstances permitted, he went personally to Poland (1918), where he became the leader of the Conservative party and was largely instrumental in organizing the new Polish Republic, of which he became Premier and Minister of Foreign Affairs (Jan. 26, 1919). In this capacity he took active part in the Peace Conference at Versailles. The unsettled conditions in Poland brought about the downfall of the cabinet in December, 1919; and Paderewski, his health seriously impaired by the stress of events, retired to his estate at Paso Robles (California). Here, however, he kept in close touch with the political situation of his native country. As he had sacrificed the greater part of his fortune to the cause of Poland, he found himself compelled to rescind the resolution regarding his artistic career, and on Nov. 22, 1922, he reappeared amidst scenes of indescribable enthusiasm at a recital in New York. Fortunately for art, he continued his distinguished artistic career and proved that the intervening five years of political excitement had not in the least impaired his supreme mastery. See **POLAND, History**.

**PAGE, HERMAN** (1866- ). An American bishop, born at Boston, and educated at Harvard and at the Episcopal Theological School. In 1891 he was ordained a priest in the Protestant Episcopal Church and until 1900 was in charge of mission churches in Idaho. He was rector of St. Paul's Church in Chicago from 1900 to 1914 and was consecrated bishop of Spokane, Wash., in 1914. He became bishop of Michigan in 1923.

**PAGE, THOMAS NELSON** (1853-1922). An American writer and diplomat (see Vol. XVII). He was appointed ambassador to Italy by President Wilson in 1913 and served in that position through the difficult period of the War, until 1919. His conduct in this office did much to continue and increase the good feeling between the Italian and American governments. His later books include *The Land of the Spirit* (1913) and *Italy and the World War* (1920).

**PAGE, WALTER HINES** (1855-1918). An American publisher, writer, and diplomat (see Vol. XVII). In 1913 he was appointed ambassador to Great Britain. His strong and frankly expressed sympathy with the English attitude during the years in which he held this post made him a popular figure in England. Much of his time, as indicated in his letters, was spent in convincing President Wilson and the officers of his government of the necessity of taking a more aggressive attitude and in favor of the Allies. During his ambassadorship, he won high praise in all quarters by the tact which he displayed and his skill in dealing with delicate and complicated problems. His strength was unable to withstand the strain imposed on him, and he returned to the United States very ill, in 1918. He resigned his post in 1918 and returned to the United States, where he died on October 12. His *Life and Letters*, published in 1923, is one of the most illuminating records of

the events of 1914 to 1918 in international politics.

**PAGE, WILLIAM HERBERT** (1868– ). An American lawyer and educator, born at Mount Union, Ohio, and educated at Yale University and the law department of Ohio State University, where he was professor of law from 1896 to 1917. In the latter year he assumed a like position at the University of Wisconsin. His many writings on legal subjects included *Page on Wills* (1901), *Page's Ohio Digest* (1914); and *Compact Code* (1921).

**PAHANG.** See MALAY STATES, FEDERATED.

**PAINE, ALBERT BIGELOW** (1861– ). An American author and editor (see VOL. XVII). His later writings include: *The Boy's Life of Mark Twain* (1916); *Mark Twain's Letters* (1917); *George Fisher Baker, a Biography* (1919); *A Short Life of Mark Twain* (1920); *The Car That Went Abroad* (1921); and *In One Man's Life* (1921).

**PAINLEVÉ, PAUL** (1863– ). A French statesman and scientist (see VOL. XVII). In October, 1915, he was appointed Minister of Instruction and Inventions affecting national defense, in the Briand cabinet. He later succeeded General Gallieni as Minister of War. He was also a member of the War Committee and from September to December, 1917, Prime Minister and Minister of War. As Minister of War he was accused by the supporters of General Nivelle (q.v.) of having interfered with the French offensive of April, 1917. In 1920 he was appointed advisory director general of Chinese government railways. He was the author of several scientific books and *A Life of Nurse Cavell*.

**PAINTING.** The history of painting from 1914 to 1924 was a continuation of the struggle which became acute during the first decade of the twentieth century, between the movement known as modernism, or post-impressionism, or, better still, as expressionism, and impressionism and other more conservative factors in painting. The years of the War almost completely checked artistic production in Europe except in so far as it could be drafted into war service, and most of this war painting was propaganda rather than art. At the end of the War the situation was very much the same as in 1914, and the struggle was still continuing in 1924. Painters were concerned with studying the means of artistic production rather than with producing real works of art. Many theories were expounded and still more pictures put on canvas to demonstrate them, but relatively little of real value had been created. It was the threshold of a new epoch, but what the result would be no one could tell. One encouraging sign was that painters of the new tendencies were so much concerned with expression, with the inner truth, with the essence rather than with the mere aspect of nature. On the other hand, these same men often did inexcusable violence to the aspect of nature.

**France.** By the end of the first decade of the twentieth century impressionism had conquered its rivals, realism and other academic tendencies, and had become dominant in official as well as in artistic circles. From 1913–21 Paul Albert Besnard (1849– ), an impressionist painter, was head of the Ecole de France à Rome and after 1922 director of the national Ecole des Beaux Arts at Paris. It was he above all others who applied the impressionist tech-

nique to mural painting. He was highly successful also as a portrait painter of women. Among other decorators of note were Jules Cheret, who united impressionism with the tradition of Fragonard; Henri Martin (1860– ), the painter of Languedoc; and Aman-Jean (1860– ). Most mural painters, however, never fully accepted impressionism. Among painters affected by it, Lucien Simon, with an admixture of realism, painted homely scenes; Charles Cottet, Parisian society. The chief pioneers of impressionism had for the most part passed on, Dégas in 1917, Renoir in 1919, both active and developing till the end; Claude Monet was still painting his scintillating landscapes. Among the younger men of strict impressionistic technique were Albert André, who is the best in still life; Maufra, Moiret, and Casals for Spanish subjects.

Great as were the achievements of impressionism, it had a serious defect which induced a speedy reaction. Concerned only with the representation of light, with the appearance of things, it had no inner life and lacked the gift of psychology. The various modernist movements therefore insisted on expressionism, i.e. that the painting should not so much represent nature itself as the painter's reaction towards nature, the emotions roused in him by the object depicted. This led to the rejection of nature as a norm. Rejecting also the flat surfaces of impressionism, the post-impressionists strove for solidity and structure. Design should be organized and not haphazard, as it is in nature; color and form symbolic, rather than realistic. One form of this reaction was symbolism, which presents nature in a symbolic as distinct from the actual form. Its foremost exponent was the delightful pastellist and illustrator, Odilon Redon (1840–1916). The group included such staunch modernists as Paul Sérusier, Maurice Denis, Pierre Bonnard, and Edouard Vuillard. The art of the first two is mystic and religious, while that of the others is decorative; Vuillard especially has been influenced by Japanese art. One group's reaction against impressionism consisted of imitation of Italian fifteenth century art, or what the English call Pre-Raphaelitism. Foremost among them were Félix Vallotton (1865– ) and Jean Prélaut (1879– ), both painters of Breton subjects.

The group known as "Les Fauves" was at first made up chiefly of pupils of Gustave Morot (1826–98), a symbolist. Rejecting their master's academic tendencies, they expressed themselves with such wildness that this term, signifying "wild beasts," was applied to them. Foremost among this group was Henri Matisse (1869– ), a very abstract painter who pushes simplification to the utmost, striving indeed to attain the vision of a child. Both in line, of which he is a consummate master, especially of outline, and in color, his art recalls Chinese and Japanese painting. The group included also Kees van Dongen (1877– ), a Dutchman, who painted fashionable Parisian society, and Modigliani (1889–1920), an Italian, who created simply colored figures on the conventions of negro art. Others of the "Fauves" afterward developed in various directions, some becoming cubists, others following Cézanne's lead. As time went on, Cézanne became more and more the dominant influence in modernist art. His closest follower was André Derain (1880– ),

an artist of great power, both in figure and landscape, whose color became increasingly severe. Another important figure was Maurice de Vlaminck (1876– ), a highly dramatic landscape painter of brilliant technique. It was he who discovered negro art as revealed in the wooden fetishes of the African savages, carved before their association with white men. Here was an art of pure plastic quality, simplified to the utmost, abstract in form, and with very remote resemblance to actuality. It greatly influenced the new movement, especially cubism. Among other artists once classed among the "Fauves" who were affected by cubism were Albert Marquet (1875– ), Othon Friesz (1879– ), Jean Marchand (1883– ), and Segonzak (1884– ). There was at the close of this period an increasing tendency among them to use forms based on nature rather than pure abstractions. A curious outgrowth of the modernist movement was feminism in painting. There have been women painters at all epochs, but their art has not differed materially from that of men. The art of Marie Laurencin, subtle in design, exquisite in color, is essentially feminine in spirit and conception, such as no man could have produced. That of Elizabeth Fuss-Amoré is very rich in color, subtly personal and feminine.

As a reaction against the flat surfaces of impressionism, cubism is concerned particularly with the expression of bulk and solidity. This it does by means of colored cubes and cylinders, following the dictum of Cézanne: "Nature can be expressed by the cube, the cone, and the cylinder. Any one who can paint these simple forms can paint nature." It is an art of organized space, linear form, movement, and color, dissociated from the actual appearance of things. The influences which contributed to its formation were Cézanne, Seurat, and especially negro and Polynesian sculpture. Matisse gave it its name and aided at its formation in 1908, but the real founder and leader had been and still was Pablo Picasso (1881– ), a Spanish sculptor. He was the author of its conventions, such as the guitar, clay pipe, the bottle of alcohol, printed letters, etc. He has well been called "the chameleon artist," as he has worked in many different manners, with cubism as a phase of his development. His color, at first sombre, had finally become frank and clear. Georges Braque was the purist of the group, a logical, rigid cubist; Fernand Leger represented the mechanical aspect. Albert Gleize, a facile writer on cubism, was painting in two rather than three dimensions, while Jean Metzinger was an orthodox cubist of the cylinder and cube variety. Among other followers of the movement in 1924 were Auguste Herbin, André L'Hôte, half cubist, half realist; Jacques Villon; Marcel Duchamps, and François Picabia. Two poets, Guillaume Apollinaire and André Salmon, belonged to the cubist group and wrote in its interest. The influence of cubism, wide and in many respects wholesome, was in the direction of solidity and expression. Many painters in different lands experimented with and to some extent adopted it. But in its rigid form cubism seemed at the close of the period to be on the wane. Picasso's latest works were more representative, under the influence of Ingres.

There had latterly been many secessions from cubism, mostly ephemeral, such as Orphism and synchronism, which are concerned with arrange-

ments of color irrespective of volume or actuality, and Dadaism, founded in Switzerland in 1917, by Tzarra, a Rumanian. This form of presentation, which had followers in France and Germany, clears away the past and is satirical in character, better adapted to cartoons than to paintings.

**Italy.** A later and more radical movement, futurism, forms Italy's peculiar contribution to modernism. It began as a protest of a band of young writers, painters, and sculptors that their country was nothing more than a vast museum of the past. Unlike the other modernists, the futurists break utterly with the past and look only toward the future; hence their name. The function of painting as they see it is to represent movement and growth, the dynamic forces of modern life. Many of their paintings bear the title "Dynamics" of this or that subject. As their manifesto puts it: "We must make a clean sweep of all hackneyed subjects and express henceforth the whirlwind life of our day, dominated by steel, egotism, feverish activity, and speed." This they often seek to accomplish by means not unlike cubism, combining in the canvas not only what the artist sees but all he knows about the subject. A typical futurist feature is the use of so-called "force lines," certain linear rhythms whose convergence or divergence convey to the artist the dominant thought or emotion he wishes to express. Color is purely arbitrary and may be used to heighten the effect. So may all manner of extraneous objects, which are simply pasted onto the picture. Futurist art indeed is cinematographic, except that it tries to show all at once what the moving-picture unfolds in a given space of time.

The founder of the movement was the poet Marinetti, who wrote its eloquent manifestoes. From 1910, when their first exhibition was held at Milan, to 1924, Luigi Russolo represented futurism in its most logical form. Umberto Boccioni, also a sculptor, was an able theorist on æsthetics, whose paintings are often of interesting design. Gino Severini was the illustrator of futurism, Carlo Carrà its most genuine painter, who, unlike the others, uses gay color. Giacomo Balla's work is merely pretty. Many of the cubists were influenced by futurism and experimented with it, and vice versa. It had won but few new disciples and seemed destined to decline.

**Great Britain.** The latest effusion of modernism, vorticism, is a product of conservative Great Britain; but before examining it a brief survey of recent British art should be made. Although the chief influence was French, impressionism in its pure form never played a great part in Great Britain. It was rather the modified form of early impressionism, as introduced by the American Whistler during his long residence in London, which prevailed. This was concerned rather with decorative and tonal effects than with the pure study of light, especially in the case of the Glasgow school, out of which came Sir John Lavery (1856– ), especially known as a portraitist. The methods of the brilliant Irish painter, Sir William Orpen (1878– ), are more akin to impressionism, while Augustus John, a Welshman (1876– ), in his powerful characterizations, tends rather to modernism. Mention should also be made of two Americans, active in London, John Singer Sargent (1856– ), whose superb technique

combined realism with impressionism, and James J. Shannon (1862–1923), whose illustrative art ranges him properly among British painters. Frank Brangwyn (1867– ) represents rather the realistic point of view in his recent superb decorations for the Panama-Pacific Exposition and the Missouri State Capitol. The powerful individual landscapes of P. Wilson Steer show a transition from impressionist to modernist technique. An important figure in the introduction of French post-impressionism into England was Roger Fry, especially by his writings and exquisite connoisseurship. It was mainly the influence of Cézanne and Van Gogh that made itself felt, and the aim was greater plastic effect but with more reference to nature than in France. Among the leaders were Spencer F. Gore (1878–1914) and Harold Gilman (1876–1919), who tended more strongly toward modernism, and Charles Ginner.

According to the theory of vorticism, "every concept, every emotion presents itself to the vivid consciousness in some primary form. It belongs to the art of this form." The "vortex" is the artist's faculty through which the emotions and conceptions pass to take concrete shape on canvas. Through it they pass from the general to the concrete. In common with post-impressionists, vorticists do not reject the work of the past; but they agree with the futurists that modern art should reflect present-day industrial civilization, with its dominance by the machine. Their paintings are in general geometric and abstract, not unlike cubism. Their aim is to purify painting, and they rely especially on the primary pigment of their art, resembling in this regard the Orphists and synchrochists. There was nothing essentially new and original in their art, which began in 1913, although several interesting painters had taken it up. The founder and principal leader was Wyndham Lewis (1884– ), with whom were associated Cuthbert Hamilton, Frederick Etchells, Edward Wadsworth, and William Roberts. The poet of vorticism was an American, Ezra Pound; the sculptor was Henry Gaudier-Brzeska (1891–1915). Vorticism was also a passing phase in the development of C. R. W. Nevinson, who experimented in other styles, including cubism and futurism, only to return in his later work to a more conservative academic art.

During the War the British government made the interesting experiment of employing several painters at the front, and many of their pictures were purchased by the Imperial War Museum. Most of the men employed were actually engaged in warfare and so painted from experience as well as observation. In the choice of artists a wise eclecticism was followed; not only accepted academicians but the most radical groups were included. And it was just these radicals whose art seemed especially adapted to the mechanical character of modern warfare. Among the most prolific of war painters was Sir William Orpen, a major in the army, whose portraits of the chief commanding officers are well known; James McBey, official painter of the army of the Near East; George Clausen, and Augustus John, who painted important commissions for the Canadian government. The futurist technique of C. R. W. Nevinson grappled most successfully with searchlights, shells, and especially aeroplanes. Paul Nash, a visionary post-impressionist, depicted what might be called nature's "dance of death," while vorticism,

through its leaders, Wyndham Lewis and William P. Roberts, showed itself well capable of representing the dynamics of modern warfare. All these artists wisely confined themselves to episodes of warfare and did not attempt battle paintings on a grand scale. One of the few good results of the War was the destruction of the old-fashioned battle picture, with its photographic detail, most characteristically seen in the works of Meissonier. The modern battle extending along a front of many miles cannot be painted. The brave array of soldiers has been replaced by the invisible crowds of the trenches. The brightly colored uniforms are now sombre browns, grays, and greens, and the modern soldier is little different in aspect from a workman. (See *War Paintings and Drawings*, by British artists, New York, 1919; and Charles Holme, *The War Depicted by Distinguished British Artists*, in *The International Studio*, 1918).

**Germany.** The War and the succeeding years levied a heavy death toll on the painters of Germany. At the close of the decade 1914–24, many of the older men were still active in the manner of their earlier work: Edward Gebhardt, religious painter, at Düsseldorf; Arthur Kampf, realist, at Berlin, and Max Liebermann, chief representative of impressionism and leader of the North German secessionists, also in Berlin. In Munich the "Decorative School," led by Franz Stuck, was somewhat akin to modernism in its realistic representation of mystic and allegorical subjects inaugurated by Böcklin. But even this was in 1924 considered conservative and official. Impressionism was an importation which never secured a firm foothold in Germany. The native tendency was all toward its antipode, expressionism, for which the soil was well prepared by earlier painters. In the early sixteenth century Matthias Grunewald distorted nature to express emotional mysticism much as El Greco did later in Spain. Hans von Marées (1837–87), rebelling against realism and early impressionism, sacrificed the appearance of things to volume and symbolic expression in his noble decorative figures. The Swiss Ferdinand Hodler (1853–1918), a powerful and arbitrary painter, developed in his later works a thoroughgoing expressionism. The influence of Cézanne, Van Gogh, and to a less extent Gauguin was early felt in Germany. But it was an exhibition of the works of the Norwegian Edvard Munch in Berlin which caused the separation of the new movement from the Berlin Secession. Cubism and futurism never obtained an important following, for the principal German tendency was toward forms of purer expressionism. There were two chief groups, at Berlin and Munich. The former group was the less radical. The facile and decorative art of Max Pechstein is more akin to the post-impressionism of other lands, and so is that of Albert Werszgerber and Carl Caspar, all of whom were influenced by Cézanne. Among the members of a more radical group at Berlin called "Die Brücke" were E. L. Kirchner, its founder, a visionary who changes city scenes into fairyland; Erich Heckel, a painter of landscapes romantic in subject; Karl Schmidt-Rottluff, whose tendency is to the colossal and even brutal; and Otto Müller, who prefers rather lyric subjects, painted in tempera.

At Munich, Russian artists contributed to produce the most radical type of expressionism. Foremost among them was Wassily Kandinsky (1886– ), a theorist who writes as well as

he paints. He maintains that the rhythm of line and color and of color in juxtaposition to color should be built up architecturally, on fixed principles of construction, as in music. Such an art appeals to the eye independently of all representation, very much as music affects the ear. His pictures are arrangements of abstract line and color without attempt to represent nature. It was he who with a few others seceded from the other post-impressionists to form the group called, from its publication, "Der Blaue Reiter." An important member of this group was Franz Mark (1880-1916), who painted impressions of animals in symbolic color. Others are Heinrich Camperdonck, whose quaint presentations of village and other subjects are essentially imaginary and unreal; Burljuk, a Russian; Baroness Werefkin, Auguste Macke, Gabriel Munter, and Adolf Bloch. Mention should also be made of Oskar Kokoschka (1866- ), an Austrian painter, the most radical of all, less abstract, but equally eccentric, and powerful to the point of brutality; and also of Emil Nolde and Karl Hofer, who paint in a similar vein.

**Russia.** At the outbreak of the War the Russian school of painting was of great importance and promise. Two factors contributed to make it unlike any other school: stage decoration and peasant art. The unparalleled success of the Russian ballet in Europe and America was due as much to its artistic settings as to superb dancing. Of unprecedented power and imagination, these decorations were all the work of Russian painters. Diaghilev, one of the St. Petersburg group, was the pioneer and the greatest painter-impresario in dramatic history. Other great designers were the painters Benois, Golovine, Léon Bakst, Anisfeld, and Larianov. The astonishing freedom of presentation in modern Russian painting and its highly imaginative and decorative qualities were due largely to this training. It was also profoundly affected by the pure, bright color schemes and the picturesque settings and costumes of native peasant art, and on its imaginative side by a vital school of book illustration, particularly of folk tales and subjects. The most important reaction against the realism of the Wanderers, chief of whom was Ilya Repin, was the "Mir Iskousstva" (Artistic World) at St. Petersburg. Unlike the former, which painted Russian contemporary life, this group sought subjects in the past, was cosmopolitan in character, and showed French influence. Alexander Benois chose the age of Louis XIV in France and that of Elizabeth in Russia; Constantine Somov, the period of 1830; Nicholas Roerich, the Viking age. The Moscow group was less learned and more pictorial and chose Russian subjects. Its best-known representatives are Igor Grabar, a *pointilliste*, to-day an influential figure in Soviet Russia, and especially Maliavin, who depicted the gay, animal side of the Russian moujik.

Meanwhile various modernist tendencies had appeared in Russia, and their influence was beginning to be felt. The War put a stop to painting, and during the revolution and the years following most of the artists emigrated from Russia, chiefly because the wealthy class which patronized art had ceased to exist. They migrated to different centres, many joining the large Russian artistic colony in Paris, where they maintained their vital national art. An exhibition of their works was shown at various

places in the United States in 1924. The exiles included Fechin, a pupil of Repin, Choukhaiev, Jakolev, Sorin, a rather conservative portraitist, Soudeikin, Stelletski, Burljuk, and especially Boris Grigoriev, whose apocalyptic hallucinations of the Bolshevik revolution and representations of the Russian populace, particularly on their brutal and bestial side, caused a sensation. Best known in the United States was Boris Anisfeld (q.v.), who exhibited repeatedly in New York and elsewhere. In Russia itself the Revolution wrought little damage to existing art works. The more important public museums, like the Hermitage in St. Petersburg and the Tretikov Gallery in Moscow, were greatly enriched by the confiscation of private collections; and the Imperial and other important palaces were transformed into museums. Throughout the length and breadth of the land new museums were established. The successful management of public art institutions, which was conceded to be better than ever before, was due to the efforts of Lunacharski, minister of public instruction. One of the daring schemes of Soviet Russia was the establishment of a new proletarian art. Rejecting cubism and futurism as bourgeois products, they acclaimed a new art, "suprematism," which denied not only all representation but even the stylization of natural forms. Kandinsky, whose art most approached this norm, was called from Munich to aid in its establishment as well as that of the provincial museums. The only official exhibition of Bolshevik paintings held outside of Russia was at Berlin in 1923. It was about the most modern exhibition ever seen. The paintings were usually labeled "constructions" or "compositions" and were built up mathematically. Simplification went even beyond Kandinsky's in the works of such men as Malevitch and Robchenko. Everywhere the search for new forms of art was in evidence. There were also many works of a more conventional character, and the impression of the whole was that of a living and vital art of telling forms and splendid color. Whether such modernist paintings fulfilled the requirements of a Soviet art as enunciated by Kamenev, "an art comprehensible to workmen and to peasants," is another question. In subject it was indeed proletarian, but representation was confined almost to posters and black and whites.

**Other European Countries.** The virile national impressionism of Sweden suffered great loss in the death of its two chief representatives, Anders Zorn (1860-1920) and Carl Larsson (1853-1919). Liliefors was still the chief painter of wild animals, and Gustav Fjaestad was painting fine snow and water scenes in *pointilliste* technique. Zorn's successor in painting the Danecarlian peasantry was Mas Olle, another good portraitist. Sweden had also its due proportion of modernists, such as Axel Törneman; Gabriel Strandberg, who painted the outcasts of Stockholm; John Bauer, whose quaint imagination found expression in fairy tales; and Ossian Elgström, with a touch of the Laplander.

The dominant figure in Norwegian art until his death was Edvard Munch, who was also something of a modernist, influenced somewhat by Cézanne. His successor was Ludvig Karsten. The foremost talent of the neo-impressionist group was Hendric Lund, while Sören Anserger was known for his nudes. Norway also had its

expressionist cult, influenced chiefly by Matisse; among its foremost representatives were Hendrik Sorensen and Axel Revold. The painting of Denmark was more conservative, although modernism had its representatives.

Belgium and Holland were strongly affected by the new movement, especially Holland. In a country which had in its art been so closely attached to the past and realistic in character, it was astonishing to what extent the new movement had spread. Although Van Gogh, one of its chief pioneers, was a Dutchman, his last and most radical works were wrought in France, and his influence entered Holland quite late; nevertheless it was powerful. Among the chief representatives of the new development were Jan Toorup, Thorn-Prikker, Willem van Konijnburg, J. J. Isaakson, and Jan Sluyters.

The death of Sorolla in 1923 removed the foremost representative of impressionism in Spain. The most interesting manifestation of contemporary Spanish painting was the nationalist school of the North, founded by Zuloaga and ably seconded by numerous followers, including the Zubiaurre brothers. In subject and treatment it was thoroughly national and continued the traditions of El Greco and Goya. It was decorative in style, with heavy outlines, rich, sombre color and vivacious expression.

**United States.** During the years 1914-24, American painting followed a normal development, less changed by recent radical tendencies than other important schools. It was also less affected by the War. During the early years of the conflict artistic production was in no wise curtailed, and it was not until after the entry of the United States in 1917 that there was any perceptible diminution in the output. There was comparatively little painting of war subjects. The death toll among older American artists during the period was heavy. To mention a few of the most prominent, William Merritt Chase and Thomas Eakins died in 1916; Albert Ryder and Carroll Beckwith in 1917; Henry Golden Dearth in 1918; C. Y. Turner, Frank Duveneck (q.v.), Ralph A. Blakelock, James Alden Weir, and Kenyon Cox in 1919; Abbott H. Thayer and J. Francis Murphy in 1921; Hamilton Easter Field in 1922; Elihu Vedder, Joseph R. Decamp, Max Bohm, Paul Cornoyer, and George W. Maynard in 1923. The former radicals of the Society of American Artists were the conservatives of the day, and even those of the next younger generation were now among the elect. All these continued their work, and many figured at the exhibitions and as medalists, such as Douglas Volk, Irving Wiles, Dewitt Lockwood, Cecilia Beaux, Mary Cassatt, Frank Benson, and Edmund C. Tarbell, among portraitists and figure painters; Waugh, Woodbury, and Emil Carlsen as marine painters, the last especially taking many medals in the later years for marines and still life; Edward Redfield, Elmer Schofield, and Gardner Symonds, as painters of winter subjects; and Childe Hassam (q.v.), the most pronounced impressionist among the older men.

Arthur B. Davies, (q.v.), known as leader of the modernists, continued his idyllic subjects with no end of variety and charm. In the years following 1913 he passed through a cubist period, which added volume and construction to his rather decorative art. So also did Robert Henri (q.v.), whose virile production and influence continued almost undiminished. Of his

former pupils, George Bellows achieved great distinction through his bold and powerful portrait and figure subjects, which won medal after medal. Other important members of this group were George Luks, William Glackens, John Sloan, and Eugene Speicher. Powerful alike in characterization and technique are the portraits of Leopold Seiffert of Philadelphia. Other portraitists known also as figure painters were John C. Johansen, Karl Anderson, Joseph Pearson, Jean M. Lane, Louis Betts, Leon Kroll, and Henry R. Rittenberg, a fine painter of still life. In the first rank of American figure painters was Charles W. Hawthorne (q.v.), who paints the inner life with beautiful and highly characteristic color. Of pronounced impressionistic technique among the younger men were Richard Miller, Frederick Frieske, and James Weiland. Mention should also be made of a characteristic branch of American painting, i.e. Indian subjects. The Taos group of painters, so called from their place of residence in New Mexico, in recent years painted many interesting representations of Indians, chiefly of the Southwest. Among their number were Julius Rolshoven, Carl Rungius, Walter Ufer, Ernest L. Blumenschein, Edward Potthast, and O. E. Berninghaus. Their work was generally impressionistic or realistic in character and of fine illustrative quality. In this connection the landscapes of Albert Groll (q.v.), the painter of the mesas and the desert landscape, should be recorded. Among painters devoted chiefly to decorative work were Violet Oakley, whose mural decorations of the Pennsylvania State House at Harrisburg attracted wide attention; Robert Chanler, whose specialty was screens showing Chinese influence but independent and modernistic in conception and execution; Hugo Ballin, and Arthur Crisp. Landscape painters among the younger generation were many. One of the strongest was Ernest Lawson, whose winter scenes are particularly fine. These subjects were preferred also by John Folinsbee and Charles Rosen, who in the later years became modernistic in tendency. Jonas Lie was painting landscapes as well as great industrial scenes, and Gifford Beal brightly colored landscapes, while Guy Wiggins was more tonal. Among the marine painters Paul Dougherty painted the Maine coast and William Ritschel the Pacific, while Hayley Lever was known especially for his boats, though he later painted other varieties of landscape with equal ability.

After the entry of the United States into the War, there was considerable activity among American painters in designing posters, especially in aid of the government loans. Many war pictures, intended to fire patriotic endeavor and represent important episodes of the War, were also painted. Among the most interesting of these was a series depicting Fifth Avenue in war time by Childe Hassam. An important series of war portraits, authorized by the National Art Commission and paid for by subscriptions in the principal cities of the United States, was presented to the National Museum at Washington. Exhibited at the Metropolitan Museum in New York City in 1921, they were all by painters of conservative tendencies. The most important was a large picture, "Signing of the Treaty of Versailles," by John C. Johansen. The remainder were portraits of the chief war celebrities of all the Allies by Cecilia Beaux, Jean McLane, Joseph

Decamp, Charles Hopkinson, Edmund C. Tarbell, Douglas Volk, and Irving R. Wiles. Another important series consisting of portraits of Americans prominently identified with the War, and also presented to the National Museum, was donated by a Norwegian, in gratitude for his own financial benefits during the War. Several of these were painted by J. H. von Rehling-Quistgaard, an American painter of Danish extraction, the remainder by artists chosen by a committee of experts.

The brilliant success with which modernism was launched in New York City and Chicago in 1913 gave great promise for the future of the movement. But this promise was not realized. Factional differences soon dissolved the International Association of Painters and Sculptors, which had organized the exhibition; and beyond separate exhibitions of smaller groups, little was heard of the new painting. In 1917 the Society of Independent Artists was founded with unrestricted membership to any one paying the nominal initiation fee. Each member is entitled to send a limited number of paintings or sculptures to the annual exhibition. As there was no jury of acceptance and the paintings were hung in alphabetical order of authorship, these exhibitions presented a strange medley of pictures excellent and worthless, academic and modernist. Nevertheless they formed an open forum, uncontrolled by official juries, for the radicals. Their most interesting feature in the later years was the work of a group of native Indian artists, without technical training and therefore modernist enough. Their chief subjects were Indian ceremonial dances, painted in pure, bright water-color. Modernist paintings were constantly on exhibition in numerous private galleries, and in New York they found a special home in the Société Anonyme's Museum of Modern Art, founded for this purpose. Among painters of distinctive modernist tendencies were Rockwell Kent (q.v.), especially in his Labrador subjects; Kenneth Hayes Miller, of much influence as a teacher; Maurice Sterne and Max Weber, both admirable teachers; Andrew Dasburg, a follower of Cézanne, Samuel Halpert and Henry McFee; Walter Pach, a cubist still-life painter; Abraham Walkowitz, William Zorach, and most important of all, John Marin, whose admirable landscapes and water-colors were accepted in all circles. Of more radical tendencies were John Covert, A. S. Baylinson, Marsden Hartley, Man Ray, S. McDonald Wright, Morgan Russell, Jay Van Everen, James Daugherty, Henry Fitch Taylor, and Katherine S. Dreier, who is chiefly known as a writer and the founder of the Société Anonyme. The foremost representative of futurism in the United States was Joseph Stella, who with rare ability depicted Brooklyn Bridge, the subway, and other characteristic features of New York.

**PALACHE, CHARLES** (1869- ). An American mineralogist, born at San Francisco, Cal., and educated at the University of California. In 1896 he became instructor in mineralogy at Harvard, where he has since remained, attaining professional rank in 1912. His many scientific papers related chiefly to mineralogy and particularly to the crystallography and paragenesis of American minerals.

**PALÆONTOLOGY.** See ANTHROPOLOGY.

**PALÉOLOGUE, MAURICE GEORGES** (1859- ). A French diplomat and man of letters, educated at the Lycée Henri IV in Paris. He entered the French diplomatic service, was secretary at Tangiers and at Rome, and was sent on special missions to Germany, Korea, and Belgium. He was assistant director of the Foreign Office and was appointed ambassador to Russia; this post he held during the War and afterward returned to the Quai d'Orsay. On the resignation of Berthelot as director general of the Foreign Office, Paléologue succeeded him. As a writer of varied interests, Paléologue published essays, biographies, memoirs, and archaeological studies. His memoirs on *La Russie des Césars pendant la Grande Guerre* (1921) throw a vivid light on the decomposition of the Russian Empire under the stress of the War. His other works include: *Vauvenargues*, crowned by the French Academy (1889); *Alfred de Vigny* (1892); *L'Art Chinois* (1888); *Profil de Femmes* (1895); *Sur les Ruines* (1897); *Le Cilice* (1901); *Rome: Impressions d'Histoire et d'Art* (1902); *La Cravache* (1904), and *Le Point d'Honneur* (1907).

**PALESTINE.** A British mandate territory and the Jewish national homeland, since July 1, 1920, under a civil administration. It includes that part of historic Palestine which lies to the west of the Jordan and which before the War was a vilayet of the Turkish province of Syria. Area, estimated at 9000 square miles. The population, according to the census of Oct. 23, 1922, was 757,182, comprising 590,890 Moslems, 83,794 Jews, 73,020 Christians, 7028 Druses, 163 Samaritans, and 265 Bahais. The capital, Jerusalem, had a population of 62,578. Other principal cities are (population in parentheses): Jaffa (47,709), Haifa (24,634), Gaza (17,480), Hekron (16,577), Nablus (15,947). Jewish immigration, which was resumed after the War, totaled 27,000 by Mar. 1, 1923. Jaffa was the principal port of entry; the immigrants came largely from Poland, Russia, Morocco, Austria, Syria, Bulgaria, Rumania, Egypt, Hungary, etc. Moslem interests were represented by a Supreme Moslem Council; Jewish interests were the concern of the Palestine Zionist executive.

**Jewish Colonies.** These colonies, totaling 80 in number, were grouped in four districts, viz. Judea (26), Samaria (17), Lower Galilee (27), Upper Galilee (10). The colony possesses schools, synagogues, public libraries, hospitals, and baths. By the end of 1923 the total population of these colonies numbered more than 20,000 and the lands which they worked included some 160,000 acres. The colonies were owned or established by the Jewish National Fund, the Palestine Land Development Company, Baron Edmund de Rothschild, and the Jewish Colonization Association. Tel Aviv, near Java,

founded by Jewish colonists in 1909, had a population estimated at 15,000 to 20,000. Its real estate had an assessed value of \$12,000,000. In June, 1923, a ££75,000 loan for municipal improvements was floated in New York.

**Education.** In 1924 there were the following government schools: 45 town schools, 267 village schools. The Christian and Jewish children attended non-government schools. Christian schools numbered 163 (13,500 pupils), the Jewish schools, 175 (18,000 pupils). There were Jewish high schools at Jerusalem and Jaffa, three teachers' training colleges, schools of music at Jerusalem, Jaffa, and Haifa, and a technical college at Haifa. In all these, Hebrew was the medium of instruction. The majority of the non-government schools were receiving state aid.

**Industry.** The productive portion of the country is the narrow strip of plain running along the Mediterranean from Gaza to Haifa. The richest region, in the neighborhood of Jaffa, was developed by Jewish colonists who carried orange and lemon cultivation here to a high degree of production. The acreage of the Jewish plantations included 3750 acres of vineyards, 8456 acres of almond groves, 3330 acres of orange groves, and 1500 acres of eucalyptus. In 1922-23, crop production was: wheat, 79,798 tons; barley, 32,079 tons; durra, 21,555 tons; olives, 14,000 tons; lentils, 3908 tons. There was in the country the following live stock: 262,000 sheep, 483,000 goats, 19,000 camels, 12,000 buffaloes. Under the direction of an agriculture department, expert advice was rendered in matters pertaining to plant diseases, fisheries, forestry, meteorology, etc. Mineral resources included sulphur, iron, coal, salt, limestone, sandstone, and gypsum. The government was applying itself to reforestation and the reclaiming of the sand-dunes. Trade, carried on largely through the ports of Jaffa, Haifa, and Gaza, continued to show an unfavorable balance over the period 1919-23. Imports for 1919-20 and 1922-23 totaled ££4,191,060 and ££5,428,146; exports for the same years were ££733,443 and ££1,376,649. The chief articles of export were oranges, soap, melons, wine, apricot paste, and almonds; the chief articles of import were cottons, cigarettes, sugar, petroleum, and rice. The principal countries of origin in 1922-23 were Great Britain and the United States, with Egypt, France, Italy, and India next in order. Experts went to Egypt, the United States, and Great Britain.

**Finance.** For the year 1923-24, receipts were estimated at ££1,787,200, divided into ££535,000 customs, ££130,000 house and land tax, ££40,000 animal tax, ££200,000 tithes, ££43,000 stamp duties, ££48,000 excise duties, ££42,000 land registry fees, ££415,000 railways, ££112,900 posts and telegraphs. Generally, the budgets balanced in the years following the War.

**Railways.** There were in operation in 1923 604 miles of railways, of which 479 miles were being operated by the government of Palestine, and 125 miles by the Palestine Railways for the British Air Ministry. The most important lines were the Kantara-Haifa (259.5 miles), Jaffa-Jerusalem (54.2 miles), Rafa-Beersheba (37 miles).

**Government.** By the constitution of Sept. 1, 1922, executive power was vested in the High Commissioner, appointed by Great Britain. A legislative council, of 10 official members and 12

unofficial, of which at least two were to be Christians and two Jews, was given the power to legislate for the mandate territory. The High Commissioner might veto any ordinance, or the British government might disallow it. By 1924 the Legislative Council had not yet been convened because of the abstention of the Arabs from the polls. The Jews chose an elected assembly, which in turn appointed a national committee to treat with the Palestine government. The British mandate for Palestine was approved by the League of Nations Council on July 24, 1922, and was promulgated on Sept. 29, 1923. On July 1, 1920, Sir Herbert L. Samuel became High Commissioner. See also JEWS AND JUDAISM; ZIONISM.

**History.** The home of the ancient Jewish kingdom, Holy Land of the Christians, which had been subject to Mohammedan rule since the failure of mediæval crusades to establish an enduring Christian government, entered upon a new phase of its checkered history in 1917, when it was wrested from the Ottoman Empire by British and Arab invaders. That Palestine would be among the spoils to be divided by the victors had been anticipated. By the secret Sykes-Picot Agreement of May 16, 1916, France and England had agreed that the ports of Haifa and Akka should be assigned to Britain, and that Palestine as a whole should be "separated from Turkish territory and subjected to a special régime to be determined by agreement between Russia, France, and England." Not content with this somewhat ambiguous pledge, the British government skillfully manoeuvred to obtain sole jurisdiction over the region. Of fundamental importance in this British move was the celebrated Balfour Declaration of Nov. 2, 1917. This highly important utterance pledged the British government to "establishment in Palestine of a National Home for the Jewish People, . . . it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and the political status enjoyed by Jews in any other country." The British policy set forth in the Declaration proceeded from two fundamental motives. As a war measure the Declaration was calculated to win the international Jewry to the cause of the Entente. Of much greater importance, however, was the knowledge that Palestine had been from time immemorial the connecting link between Mesopotamia and Egypt and that it is the strategic point which potentially controls the road to India by land and by sea. The establishment of a Zionist state under British protection gave Great Britain this priceless and coveted possession, and, while it cemented the foundations of the British Empire, homage was done at the same time thereby to the Allied slogan of "self-determination of nations." The British project, a superb combination of altruism and imperial *Realpolitik*, had unfortunately some serious drawbacks which had been left out of consideration, namely the fact that modern Palestine was not a Jewish country, and secondly the ever-growing opposition of Arab nationalism, of which Great Britain itself had been the chief instigator. Moreover, the British had overlooked a very important factor. Palestine is not only the natural link between Mesopotamia to the northeast and Egypt to the southwest, but it also lies at the mouth of the great Arab reservoir of man power to the south,

whence the Arabs had poured forth since the earliest days into the neighboring regions. The attempt to close this outlet by an artificial Jewish state under the protection of the British Empire was naturally fraught with danger, and all the more so since the Balfour Declaration conflicted, in the opinion of the Arabs at any rate, with the British commitments to the Sherif of Mecca in 1914 and 1915.

When Palestine was wrested from the Turks it was in an exhausted condition. The land was untilled and production had fallen to a low ebb. The population had decreased considerably during the War and the whole system of civil government had fallen to pieces. Immediately after the occupation the British set up a military administration which after much effort succeeded in bringing about an improvement. Gradually cultivation was restored and normal life began to return. But much more had to be accomplished. Palestine, a country with a variety of soils and climates, had always been undeveloped and underpopulated under Turkish rule, and the British aim was to bring out the great latent fertility of the country. As for the Jewish population, which had been very small during the 19th century and had risen to about 100,000 before the War, it formed in 1918 only a fraction of a total population which was predominantly Arabic-speaking and, if not entirely Arab in racial composition, at least claimed to be Arab.

On Sept. 27, 1919, Zionism, which had been a force in the Jewish world for some time before the War, pleaded its case before the Supreme Council and asked for the recognition of the historic title of the Jews to Palestine and for the right to reestablish there a national home. Furthermore, they requested that the sovereign possession of Palestine be vested in the League of Nations and that Great Britain as a mandatory of the League be empowered to govern the country. After a long delay, during which the first manifestations of Arab national sentiment against this proposed settlement occurred, the Supreme Council at the Conference of San Remo, Apr. 25, 1920, granted the mandate to Great Britain and in July of the same year the military administration was replaced by a civil régime under Sir Herbert Samuel, a prominent English Jew, as High Commissioner. In October, 1920, an Advisory Council was set up, consisting of ten officials of the administration, four Moslems, three Christians and three Jews. Much attention was given to local government and 22 municipalities and 14 local village councils were established. As for education, the Turkish system was reorganized and extended. The Moslem children attended the government schools where Arabic was the principal medium of instruction, but most of the Jewish children went to schools conducted by the Zionist Organization and the Christian children attended the schools maintained by the ecclesiastical and charitable bodies. Considerable progress was made in the direction of public health and sanitation, which had been very low under the Turkish régime. The law of the land was in substance that of the Turkish Code. The abolition of the Capitulations, which had been decreed by Turkey at the outbreak of the War, was maintained, except in the case of the United States. Foreigners were tried by a British magistrate or by a court with a majority of British judges. Public security was maintained by a police force

and gendarmerie recruited from all sections of the population.

The Zionist claims to Palestine were recognized in the Peace Treaty of Sèvres, and the Balfour Declaration was incorporated in the text of that document. After much contention between the English and the French over the boundaries between Palestine and Syria a convention defining these was signed on Dec. 23, 1920. A final agreement relative thereto was concluded on Feb. 3, 1922. The draft for the Palestine mandate was submitted to the League of Nations on Dec. 7, 1920, and approved in July, 1922. Its promulgation was delayed, however, due to the opposition of the Italians to the French Syrian mandate with which the Palestine mandate was bound up. The mandate realized practically all the demands of the Zionists at the Paris Conference in 1919. The region to the east, known as Transjordan (q.v.), was under the authority of the High Commissioner, but enjoyed a special status and was not included in the area of the Jewish National Home. Subsequently Abdullah, son of the King of the Hedjaz, was established as Emir of this region.

Meanwhile the nationalist sentiment of the Arab majority, which had received a powerful stimulus in consequence of the events of the War, chafed against the arrangements for a Jewish National Home. Serious riots took place in Jerusalem in April, 1920. In February, 1921, a congress of the Palestinian Arabs was held, at which protests were registered against the Balfour Declaration and demands were made for a national government and a legislative assembly to be elected by the Arabic-speaking population residing in the country before the War. A permanent committee was set up whose purpose it was to work in this direction. On May 1, 1921, the extreme anti-Jewish feeling manifested itself in widespread disturbances in the course of which military force had to be employed to restore peace. This led to a thorough investigation of the affairs in Palestine by a commission, in the report of which the Arab grievances were analyzed and both sides were exhorted to refrain from all expression of extremism and to work in a spirit of moderation for a lasting understanding and for the development of the country. But the report upheld the policy of the Balfour Declaration and said nothing which could serve to allay the apprehensions of the Arabs. In order to settle the grave difficulties, the British government drafted a constitution for Palestine, the chief provisions of which were given to the press in February, 1922. According to this document supreme executive authority was to be vested in the High Commissioner, who was to be assisted by an Executive Council. Provision was made for the establishment of a Legislative Council, to consist of 10 officials and 12 unofficial members, the latter to be elected under a system of primary and secondary elections. The acts of the Legislative Council were to require the assent of the High Commissioner or in certain cases that of the British government. In regard to the judicial system, provision was made for the setting up of separate Moslem, Christian, and Jewish religious courts with English, Arabic, and Hebrew as the official languages. The British government was to be the arbiter in complaints regarding nonfulfillment of the terms of the mandate, but the procedure in such cases was to be prescribed by the League of Nations.

After the publication of the draft of the Constitution, a delegation, claiming to represent the entire Christian-Moslem population of Palestine, went to England to protest against the provisions. The chief complaint of the Arabs centred on the limited self-government which was to be bestowed on Palestine under the Constitution and it was claimed that such restriction was contrary to Article 22 of the Covenant of the League of Nations. The reply of the British government made clear that a different course and in particular the establishment of a national government was not open to Great Britain since this would have involved an abandonment of the Balfour Declaration and the pledge regarding a Jewish National Home. The British, in fact, could not repudiate the policy of the Balfour Declaration if they wished to retain their hold on Palestine, the possession of which was so invaluable for the safeguarding of the British Empire. In view of the powerful possibilities inherent in Arab nationalism, it was doubtful indeed whether an Arab Palestine would have been as pliable an instrument in British hands as a Jewish Palestine was. The Palestinian Arabs, on the other hand, responding to the virile movement of Arab nationalism, could not very well recede from their position of opposition to Zionist rule in view of the fact that the Jews constituted only a fraction of the total population of Palestine. According to the figures of the official census of 1922, which divided the population along religious lines, the total population in that year was 755,000, composed as follows: Moslems, 589,564; Christians, 73,026; Jews, 83,794; Druses, 7028; other religions, 1446. Most of the Christians spoke Arabic, were racially akin to the Arabs, and sided with the latter against the Jews. A serious consideration in this connection was the fact that a Zionist Palestine was a direct challenge to that still obscure but nevertheless potent revolt against Western civilization which was slowly crystallizing in post-war Pan-Islamism. Arab nationalism could be regarded in many aspects as the advance guard of this movement which involved a new form of the Moslem faith and as such stood for a social and cultural conception which was opposed to the West.

A lengthy declaration of the British policy, issued in July, 1922, attempted to allay the apprehensions of the Arabs. It referred to these as "partly based upon exaggerated interpretations of the meaning . . . of a Jewish National Home in Palestine" and stated at the same time that the Balfour Declaration was "not susceptible of change." While the Zionist Organization declared itself satisfied with this declaration, the Arab delegation refused to accept it and returned home in the fall of 1922. Thereupon the Arabs decided to boycott the elections for the Legislative Council which were held in the beginning of 1923. Since this boycott precluded the creation of a legislative body representative of the majority of the people, the British government suspended for the time being the part of the Constitution dealing with the Legislative Council and restored the Advisory Council which was to have been abandoned under the Constitution. This new Advisory Council, which was to consist of eight Moslems, two Christian Arabs, and two Jews, was, however, impossible of formation, because, under pressure from the Nationalists and particularly from the Arab delegation which had recently returned

from London, most of the prospective members refused to serve on it. Meanwhile Palestine had become filled with rumors of an agreement between Great Britain and the King of the Hedjaz under which Palestine was to become part of the domain of the latter. In spite of the Palestine government's denial of the truth of these rumors, considerable excitement ensued and the Sixth Palestine Arab Congress, which met in June, 1923, found it necessary, in view of the conflicting opinions prevailing among Moslems, Christians, and Jews, to declare that it was opposed to any such course. After the Congress, another delegation was sent to London, which soon returned, its mission having been a complete failure. The confirmation in 1923 by the League of Nations of the British mandate for Palestine and the consequent legalization of the existing status failed to impress the Arab population, which continued its intransigent attitude. The government's offer for the creation of an Arab Agency similar to the Jewish Agency meeting the adamant opposition of the Arabs, the government proceeded to form an Advisory Council consisting of officials only. At the same time a new moderate Arab Liberal party sprang into existence, which, in spite of its opposition to the old party, failed to evince much moderation in its programme. The year 1923 was marked by a final settlement of the frontiers of Palestine and Syria through agreement between the mandatory powers and by Great Britain's recognition of Abdullah's Transjordanian government as an independent state, although Transjordan (q.v.) remained in fact a British protectorate and was subsequently protected, during an uprising, by British military force. See also ARABIA; CALIPHATE; PAN-ISLAMISM. TRANSJORDANIA.

**PALMER, A (LEXANDER) MITCHELL** (1872- ). An American lawyer and public official, born in Moosehead, Pa., and educated at Swarthmore College. After studying law, he was admitted to the bar and practiced for several years in Stroudsburg, Pa. He was a member of Congress from 1909 to 1915 and in the latter year was appointed judge of the United States Court of Claims. This post he resigned after a few months. He was appointed Alien Property Custodian in 1917 and served until 1919, when he was appointed Attorney General of the United States in President Wilson's Cabinet. He was prominently mentioned as a presidential candidate in 1920. Following his retirement from political life, he resumed the practice of law.

**PALMER, FREDERICK** (1873- ). An American author and war correspondent, born at Pleasantville, Pa., and educated at Allegheny College. From 1895 to 1897 he was a newspaper correspondent in London. As a war correspondent he witnessed the Greek War in 1897. During the Spanish-American War he was in the Philippines and accompanied the expedition for the relief of Peking, China, in 1900. Other campaigns in which he was correspondent were those in Central America and in Macedonia in 1903. He was also a correspondent in the Russo-Japanese War and accompanied the American Battleship Fleet in its round-the-world cruise (1907-08). He investigated conditions in Central America in 1908-09 and witnessed the Turkish revolution in 1909 and the Balkan War of 1912. From 1914 to 1916 he was accredited correspondent of the American press with the British army and fleet and in 1917 was commis-

sioned major and lieutenant-colonel in the United States Army Signal Reserve Corps. His writings include *Going to War in Greece* (1897); *The Ways of the Service* (1901); *Central America and Its Problems* (1910); *My Year of the War* (1915); *My Second Year of the War* (1917); *America in France* (1918); *Our Greatest Battle* (1919); and *The Folly of Nations* (1921).

**PALMGREN, SELIM** (1878- ). A Finnish composer, born at Björneborg. After graduating from the Helsingfors Conservatory he continued his pianistic studies in Berlin with Ansorge, Berger, and Busoni. He was conductor of a choral society in Helsingfors from 1902 to 1904 and in 1909-12 conducted the orchestral concerts of the Music Society in Åbo. He has appeared extensively as a concert pianist and guest conductor in Finland and Scandinavia. In 1909 he married the famous Finnish soprano, Maikki Pakarinen. In 1921-22 both artists made a very successful tour of the United States. Palmgren's compositions are original and beautiful music and yet conform to established standards. He wrote two operas, *Daniel Hjort* (Helsingfors, 1910) and *Peter Schlemihl* (not produced); a symphonic poem, *Floden*; incidental music to *Tukkimo*; three concertos for piano and orchestra, and songs and male choruses. Special mention should be made of his compositions for piano solo, which show his genius at its best and deserve to rank with similar works of Grieg.

**PAN-AFRICAN MOVEMENT.** See **AFRICA**.

**PANAMA.** A Central American country situated between Colombia and Costa Rica. Area, 32,380 square miles; population, census of 1923, 446,098, a gain of 29 per cent over 1910. The Canal Zone (not included in the above) had 71,682 inhabitants in 1911 and 22,858 in 1920. Panama, the capital, had, in 1920, 59,458 (37,505 in 1911); Colon, 31,203 (17,748 in 1911). In the 339 government public schools, 35,255 children were in attendance in 1922. In 1911, a national college, the Instituto Nacional, was erected.

**Industry and Trade.** Only a small area continued to be cultivated. The leading crops were: bananas, coffee, cacao, caoutchouc. Sugar was beginning to take on importance, the production in 1922 being 6,055,700 pounds, and consumption, 8,000,000. Tobacco, too, was becoming prominent. As a result of the extensive cattle-rearing, the export of hides was large. In 1905, there were 65,000 cattle; 200,000 in 1916, and 300,000 in 1922. The trade, during the decade 1914-24, showed little increase except for 1920, which was the country's most prosperous year. Imports totaled \$17,561,994, almost 50 per cent greater than those of 1913. But because of the ensuing depression, the imports dropped to \$11,372,370 for 1921, and \$10,220,168 for 1922. In 1912, the United States supplied 53.7 per cent of the imports, Great Britain 24.1 per cent, Germany 10.9 per cent. In 1920, the proportions were: United States, 76 per cent; Great Britain, 6.3 per cent. In 1922, they were: United States, 68.4 per cent; Great Britain, 9.2 per cent. Exports, by comparison, were worth much less. In 1913 they totaled \$5,383,028; for 1920, \$3,552,166; for 1921, \$2,495,407, and for 1922, \$2,487,478. In 1921, the United States took 93 per cent of the total value, and in 1922, 87 per cent. Bananas annually accounted for

more than half the exports. Others were: coconuts, balata, hides, gum, sugar. Principal imports were: cotton, iron, steel, flour. All the international commerce of Panama moved through the ports of Colon, Panama City, and Cristobal and Balboa in the Canal Zone.

**Finance.** The finances, reorganized by an American fiscal agent, were based on a biennial budget. For the period 1913 and 1914 the budget balanced at \$7,682,428. For 1922, revenues were \$5,299,999 and expenditures \$6,900,217. The foreign debt at the beginning of 1922 was \$2,671,680. In 1923 a loan of \$4,500,000 was floated in New York for highway construction and the development of the country's resources. This was secured by the income from the \$6,000,000 which Panama had invested in New York City real estate after the Canal Zone purchase.

**History.** The constitution, as amended Dec. 26, 1918, provides for a president directly elected and ineligible as his own successor, and a directly elected chamber of deputies. The provincial governors are also to be popularly chosen. Presidents for the period were: 1912-16, Belisario Porras; 1916-20, Ramon M. Valdez (died), Ciro L. Urriola; 1920-24, Belisario Porras. By the treaty between Colombia and the United States (finally ratified in 1921) the former recognized Panama's independence. Panama, having been an Associated Power in the War, became an original member of the League of Nations. Panama's continued refusal to accept the White decision (1914) in respect to her boundary dispute with Costa Rica led troops of the latter to seize the town of Coto on Feb. 28, 1921. The danger of general hostilities caused the United States to offer its good offices, which both sides accepted on March 9. The United States insisted that the White award be accepted, and Panama, still protesting, was compelled to withdraw her troops from Coto. In 1922, the Hay-Bunau-Varilla treaty of 1903 with the United States was the subject of discussion in Washington, the purpose being the removal of those causes of friction under which Panama had chafed for two decades. These included property valuations for the Canal Zone, a free port, docking privileges, etc. In 1924, negotiations were begun for the revision of the Taft agreements of 1924 regarding the Canal Zone.

**PANAMA CANAL.** This great engineering work was opened to traffic Aug. 15, 1914, and since that time has proved an ever-increasing factor in the commerce of the world. It is used by ships of practically all nations having merchant shipping and has served to reduce materially the time and cost of transportation from one continent to another. The canal was opened in 1914 notwithstanding the fact that in the latter part of 1913 there had been serious earth slides in Culebra Cut, and on Oct. 13, 1914, navigation was seriously interfered with until the material could be dredged out. These slides have occurred from time to time and cut off traffic from September, 1915, until Mar. 27, 1916; but since that time, with constant dredging and a careful study of local conditions, it has been possible to keep the canal open to traffic.

As the canal found increased use, docks, warehouses, and repair facilities were provided at either end, and the harbors were dredged to give access for the largest vessels using the canal. Fortifications protecting the canal and

its works were constructed, and every effort was made to secure its maintenance and operation on an economical and efficient basis. In fact, it was not many years before the canal more than paid all operating costs, and while this did not take into consideration the overhead and the interest on the original outlay, yet it prevented the canal from being a burden to the nation. The cost of the Panama Canal up to the end of the fiscal year ending June 30, 1915, including the balance of appropriations still on hand and available for work in progress, was \$357,436,048, from which should be deducted receipts from the sale of construction material and equipment and the value of buildings and plant turned over to the United States Army and the Alaska Railways. Additional expense was of course involved for government sanitation, payment to the Panama government, etc.; but the sum mentioned covered the actual cost of the project. See UNITED STATES.

The growing use of the Panama Canal is indicated by the accompanying table and particularly by the statement that during the calendar year 1923, 5037 commercial vessels passed through the canal, a greater number than in any previous year. These vessels had an aggregate net tonnage, Panama Canal measurement, of 24,737,437, carried 25,160,545 tons of cargo, and paid \$22,966,838.18 in tolls.

| Calendar year     | No. of ships | Panama Canal net tonnage | Tolls          | Tons of cargo |
|-------------------|--------------|--------------------------|----------------|---------------|
| 1914 <sup>a</sup> | 350          | 1,284,293                | \$1,508,737.56 | 1,758,625     |
| 1915 <sup>b</sup> | 1,154        | 3,902,592                | 4,297,467.11   | 4,893,422     |
| 1916 <sup>b</sup> | 1,217        | 3,817,704                | 3,671,162.68   | 4,774,822     |
| 1917              | 1,960        | 6,217,054                | 6,107,696.63   | 7,443,610     |
| 1918              | 2,070        | 6,409,886                | 6,317,455.39   | 7,284,159     |
| 1919              | 2,133        | 6,943,087                | 6,973,095.30   | 7,477,945     |
| 1920              | 2,814        | 10,378,265               | 10,295,362.21  | 11,236,119    |
| 1921              | 2,783        | 11,435,811               | 11,261,098.80  | 10,707,005    |
| 1922              | 2,997        | 12,992,573               | 12,573,407.77  | 13,710,556    |
| 1923              | 5,037        | 24,737,437               | 22,966,838.18  | 25,160,545    |
| Total             | 22,515       | 88,118,702               | 85,972,321.63  | 94,446,808    |

<sup>a</sup> Canal opened to traffic Aug. 15, 1914.

<sup>b</sup> Canal closed about three months by slides.

A total of 2714 vessels made the transit of the Canal from the Atlantic to the Pacific as compared with 2323 from the Pacific to the Atlantic. In tolls \$11,534,023 was collected on vessels passing from the Atlantic to the Pacific as compared with \$11,432,815.57 on vessels from the Pacific to the Atlantic.

An important development was the increasing use of the Panama Canal for the transportation of petroleum by tank vessels (see PETROLEUM), for the most part loaded on the coast of California. During the calendar year 1923, 1704 of the tank ships with a tonnage of 10,079,921 net tons passed through the Panama Canal, paying \$8,967,647.41 tolls, and carrying 9,625,714 tons of cargo. This was 33.8 per cent of the total number of transits during the year, 40.74 per cent of the total Panama net tonnage, 39.08 per cent of the tolls collected, and 38.25 per cent of the cargo carried through the Canal. Of these vessels 869 were laden and 835 were in ballast. Of the former, 804 made the transit from the Pacific to the Atlantic and 65 from the Atlantic to the Pacific, while 812 vessels in ballast went from the Atlantic to the Pacific and 23 from the Pacific to the Atlantic. In 1922 the Panama net tonnage of tank ships passing through the Canal was 1,557,931 tons, with a cargo of 1,423,695 tons, as compared with 10,-

079,921 Panama net tons and 9,625,714 tons of cargo in 1923, increases of 647 per cent and 676 per cent respectively. See COLOMBIA, *History*.

PANAMA CANAL TOLLS ACT. See UNITED STATES, *History*.

PAN-AMERICAN CONFERENCES. The Fourth Pan-American Conference, held in Buenos Aires July 1-Aug. 30, 1910, closed its sessions without deciding on the seat of the Conference to be held during 1914. Later, in 1913, the direction of the Pan-American Union chose Santiago in Chile as the meeting place of the fifth Pan-American Conference, but due to the outbreak of the War in 1914 the Conference was postponed indefinitely. Finally, in 1922, it was decided to hold the Conference in the City of Santiago during 1923. Meanwhile, in the interval between the Fourth and the Fifth Conferences numerous manifestations of Pan-Americanism occurred. Thus the Second Pan-American Scientific Congress, which was in session at Washington during the three weeks following Dec. 25, 1915, appointed an International High Commission which met during 1916. The two Financial Conferences which met in Washington in 1915 and in 1920 dealt primarily with questions of public finance and with the monetary and banking situation in Pan-America and resulted in the creation in each country of a Financial High Commission, presided over by the respective minister of finance. At the Conference of the Pan-American Federation of Labor in Laredo, Texas, in November, 1918, which was attended by delegates from the United States, Mexico, and Central America, a permanent federation was organized. Two Pan-American Child Welfare Congresses were held in Montevideo in December, 1918, and in May, 1919, at the second of which provisions were made for the establishment of an International Bureau of Child Welfare. The Second Pan-American Commercial Conference was in session in Washington during June, 1919.

The Fifth Pan-American Conference opened at Santiago on Mar. 26, 1923, and closed on May 11 after a session as to the results of which there is wide divergence of opinion. All American countries were represented, except Canada, which lacked "sovereignty," Mexico, which at the time was not "recognized" by the United States, and Peru and Bolivia, which refused to attend because of their differences with Chile. The 18 subjects on the agenda were divided into the large groups disarmament, political coöperation, coöperation in commerce, hygiene, education, agriculture, etc. The most vital question by far was the disarmament problem, which concerned chiefly Argentina, Brazil, and Chile, since the United States was covered by the Washington Arms Pact and the other Latin American countries had only insignificant armament. If the chief object of the Conference was the fostering of closer relations between the states of the American continent, no such end was attained as far as the A B C States were concerned, inasmuch as the negotiations on disarmament resulted only in deepening the already existing discord between them. No satisfactory agreement was reached due to differences between Argentina and Brazil, each of which accused the other of aggressive aims and insisted on her own pacific intentions. While the Conference thus ended in ill feeling between the A B C States, it was not necessarily the total failure which it has been regarded in many

circles, for the disarmament question was only one out of 18 subjects before the Conference.

Under the heading "political coöperation" the most important topic under discussion was the plan for the formation of an American League of Nations for which there seemed to be strong sentiment among the Latin American delegates. Two methods were projected to accomplish this, namely, the creation of a new association of the American states and the enlargement of the Pan-American Union which was the *ad interim* Executive Committee functioning in the interval between the Pan-American Conferences. The Latin Americans were able to wrest an important concession from the United States with respect to the composition of the governing board of the Pan-American Union. Hitherto this board had been composed of the diplomatic representatives of the American states in Washington and of the United States Secretary of State as permanent president. Latin Americans considered this system highly disadvantageous to them since thereby membership was restricted to countries enjoying American approval and since the representatives, due to their diplomatic status in Washington, were prevented from commenting on important problems with the necessary freedom. Hence at Santiago the composition of the governing board was attacked by the Latin American delegates with rather un-Latin bluntness. After three weeks of struggle a final compromise was effected whereby it was provided that the board should, as heretofore, be composed of the diplomatic representatives of the American states in Washington and of the United States Secretary of State, but that any country not having accredited representatives in Washington, or whose representative was temporarily absent, should be free to appoint a special representative on the board. At the same time the presidency was made elective and Costa Rica's proposal for the free appointment of any person as a country's representative on the governing board was referred to the governments for study. In contrast to this partial success, Uruguay's proposal to bind the American nations closer together by the formation of a compact American League of Nations was shelved by the decision to hold over the plan and to recommend it for report to the next Pan-American Conference. During the debate on this subject some of the Latin American nations, led by Colombia, made some terse statements regarding the need of defining the Monroe Doctrine. Although the United States delegation tried consistently to ignore the topic it was finally compelled, under pressure from all the Latin American delegations, to state its position, which was that the Monroe Doctrine was a unilateral doctrine for which the United States had been and must continue to be solely responsible. A forward step was the revival of the commission of jurists to codify American international law, to whose next meeting, set for 1925 in Rio de Janeiro, was referred among other important matters the proposal of Costa Rica for the creation of an American Court of Justice.

Noticeable progress was made in regard to the third group of subjects on the agenda, viz., coöperation in commerce, education, hygiene, agriculture, etc. An advance was made toward the solution of the problem of the adequate protection of trade marks, a question which had been before nearly every Pan-American Conference, by an agreement which protects fully the laws

and conditions of every American country and provides a simple way for the registering of trade-marks in every American country. The Committee on Hygiene worked out a complete programme for public health in America and reported favorably on the question of the restriction of alcoholism on the American continent. The Committee on Education recommended the holding of a Pan-American Educational Conference in Santiago in 1925 to consider the exchange of professors and students and the standardization of university courses, credits, and degrees.

**PAN-AMERICAN UNION.** See PAN-AMERICAN CONFERENCES.

**PAN-GERMANISM.** The term Pan-Germanism has a twofold meaning. In a loose sense it is a term popularly employed in many countries to stigmatize what was regarded as the German policy of imperialism and aggression before and during the War. This popular application of the term to German political and economic imperialism, or Germany's policy as a world power, was strictly an outgrowth of war-psychology, stimulated by effective propaganda, and was valid only to the very limited degree to which German world policy was affected by the aims and the doctrines of the Pan-German movement. It was only this latter movement, an expression of extreme German nationalism, which with justice could be called Pan-German. This movement, which had its inception in the '80's and '90's of the last century and the nucleus of which was the Pan-German League, a numerically weak but very aggressive and vocal group, aimed at the creation of a Greater Germany—to be composed of the German Empire, Austria-Hungary, Denmark, Holland, Belgium and Switzerland—and at the absolute hegemony of this superstate on the European continent. At the same time the Pan-Germans strove for world expansion, naval supremacy, and an extensive colonial empire. The fundamental thesis underlying these aims was the ethnical superiority and the cultural unity of the Teutonic peoples. In the German Empire the Pan-Germans were a relatively insignificant group and at the most only an extreme nationalist minority. In the eyes of the world outside, however, and especially to such people as were only too anxious to find manifestations of this sort in Germany, the Pan-Germans were proof of the widespread existence of aggressive designs, and their vociferous clamoring assumed an importance which was entirely disproportionate to their influence on the government or on public opinion. Although the government attempted with bad success to suppress the Pan-Germans as much as possible and the latter attacked the government's policy as sadly inadequate and detrimental to Germany's true interests, Germany's opponents before and during the War represented the Pan-German fulminations to be an expression of the real German policy. Thus there arose slowly the popular conception that German imperialism was a nation-wide and government-directed Pan-German scheme. The contrast between the Pan-Germans and the German government was attested by the attempts of the latter to suppress the Pan-German publications and pamphlets immediately after the outbreak of the War.

Throughout the War the Pan-Germans stood for the application of ruthless methods of warfare, notably for the unlimited employment of the submarine, and for the most far-reaching an-

nexations. While they worked in close harmony with certain military and naval circles, they exerted little influence over the German people and met with determined opposition from the civil government. It was only due to the interminable duration of the War, the ever-increasing sacrifices, and the insufferable economic hardships resulting from the blockade that the government and public opinion were finally induced to look with favor on unrestricted submarine warfare. Whatever hold Pan-German ideas had obtained on the people during the War was swept away during 1918 and after the Armistice by the democratic wave which came over Germany. The Kapp Putsch in March, 1920, a Pan-German attempt to seize power, was foiled by the determination of the workers. If later there was a revival of Pan-Germanism, it must be ascribed to the Peace Treaty of Versailles and its dismal consequences for Germany. The complete national humiliation and degradation, political and economic, which Germany experienced after 1919 produced a recrudescence of extreme nationalism, the results of which were numerous parties and organizations with Pan-German tendencies. Proof of the revival of Pan-Germanism as a result of the working of the Peace Treaty were the nationalist activities in Bavaria during 1923 and the results of the elections in May, 1924, when 32 representatives of the Völkische party were elected to the Reichstag. The Völkische or National Socialist party was, in 1924, the strongest and most vocal exponent of Pan-German ideas. See WAR IN EUROPE.

**PAN-ISLAMISM.** Pan-Islamism is a movement which aims at the bringing together of the Moslems of the world regardless of nationality. As such it is both spiritual and practical. It had existed in some form or other ever since Islam first made its appearance, but entered in modern times into a more active stage under the reign of the Turkish Sultan Abdul Hamid during the nineteenth century, when it was made to serve the ends of the Turkish state. Despite their free-thinking religious tendencies, the young Turks, for political reasons, adopted in 1911 a definite scheme of Pan-Islamic propaganda and worked industriously in the direction of the union of the Moslems under the leadership of Turkey. The Turkish-Italian War and the Balkan Wars gave new impetus to the movement, and the Ottoman Empire received in these struggles the sympathy of all the Moslems as well as active aid from many Mohammedan quarters outside of its confines. At the same time, however, Pan-Islamism in its broader sense encountered many obstacles. The Young Turks themselves, by reason of the particular character of their doctrine, were more and more drifting into Pan-Turanian (q.v.) channels. The spread of nationalism in various Moslem countries like Mesopotamia and Syria was detrimental to Turkish Pan-Islamism. Other Mohammedan peoples, and particularly the Arabs, while quite willing to acknowledge the religious power of the Sultan, objected to his assumption of secular power over the non-Turkish Moslems. On the whole the doctrine of Pan-Islamism, as set forth by the Turks, i.e. the concerted action of all the Moslems of the world under the leadership of the Sultan at Constantinople, was rather vague and suffered from many inconsistencies, as was conclusively proved by the events of the War. When Turkey entered the

War on the side of the Central Powers, the Grand Mufti issued a call to all Moslems to defend, in the *Jihad* or "Holy War," the Islamic faith against the "Infidels." The call to arms was by no means generally effective, since it was realized by many Mohammedan leaders that Turkey had entered the war as ally of infidel powers. Moreover, the loyalty of the dependencies of Great Britain, France, Russia, and Italy, or perhaps the apathy of their inhabitants to the Turkish cause, proved in most cases stronger than the incitement to religious fanaticism. Even in the Ottoman Empire itself the support was by no means encouraging. The Arabs, who had long resented the heavy hand of their Turkish overlords, revolted and by their timely aid helped the English to eliminate Turkish rule in Arabia, Mesopotamia, Palestine, and Syria. The result of this revolt was the Arabic Kingdom of the Hedjaz and the loss to Turkey of the Holy Places in defense of which the *Jihad* was to be waged. The greatest success which the Turkish "Holy War" was able to register was the rising of the Senussites, a Mohammedan sect of great power in northeastern Africa and the eastern Sahara. The *Jihad* of the Senussites was conducted for several years against the British on the western border of Egypt and in the Sudan, and against the Italians in Tripoli, but failed finally, chiefly because of the failure of the adjoining Mohammedan peoples to support the movement. In the central and east Asiatic possessions of Great Britain and Russia, and in the French possessions in Africa, the "Holy War" aroused little enthusiasm, primarily because the inhabitants of these regions were too far removed from the scene of action to take great interest in the Turkish cause and to exert themselves for a Turkish Caliph of whom they perhaps had never heard. Another reason for the failure of the "Holy War" was the fact that the old-time *Jihad*, based on religious fanaticism, was an antiquated method of warfare in the twentieth century. It is no doubt true, however, that the *Jihad* and the Turkish Pan-Islamic movement succeeded in stirring up unrest in the Asiatic and African possessions of the Allies, but at no time did the situation become serious. Even Afghanistan, which was pro-Turkish and anti-British in sentiment, failed to take up arms against the Allies at that time.

With the breakup of the Ottoman Empire and the rise of the new Turkish Nationalist state in Anatolia, the main driving force behind Pan-Islamism as it had been understood before and during the War disappeared. The Turks had always been strangers to the greater number of the Moslem population and the Turkish Nationalists devoted their attention now to their Turanian kinsmen, many of whom were non-Moslems. Thus the Pan-Turanian movement entered into a more vigorous stage. The Arabs, on the other hand, who during and after the War had come into their own and who for historical and other reasons should have been the natural protagonists of Pan-Islamism, had since the War gone in for Arab nationalism. In addition, they were divided by old tribal differences and animosities and in Arabia itself bitter feud prevented any coöperation between the King of the Hedjaz and the Wahabites, the two all-powerful factions in the country. The most conscious expression of the Pan-Islamic idea was to be found in the post-war period among the Moslems of India, the leaders of whom set afoot an active

propagandist movement and preached by word of mouth and through writings the union of the Mohammedan peoples. In spite of its apparent inertia in the last years, however, Pan-Islamism was latent in the steadily growing unrest and revolt against the West, which, without any central direction for nationalistic or imperialistic ends, had been taking shape in the Asiatic world since the Armistice. This revolt of the East against the West contained all the essential elements of Pan-Islamism, but was in character quite different from the Turkish conception of this movement. It was a spiritual creed and embodied at the same time a complete social system. In this sense it was the natural counterpart of the Western nationalistic movement and a force with which the Western Powers had to reckon. That these powers had some realization of this fact was clearly manifested by the eagerness with which Great Britain and France attempted to capture the leadership of the Pan-Islamic movement upon the abolition of the Caliphate by the Turkish Nationalists. While the situation in the Moslem world was very hazy and undefined, one thing seemed certain, namely, that Western materialism had encountered serious Islamic opposition. "The theory of the spiritual and cultural unity of Islam," said the Aga Khan, "is the foundation of its life and soul." See, also, ARABIA, CALIPHATE, PAN-TURANIANISM, TURKEY.

**PAN-SERBIANISM.** See WAR IN EUROPE.

**PAN-TURANIANISM.** The term Pan-Turanism is usually applied to the rather loose and vague movement which aims at the awakening of a sense of racial unity among all the various peoples of supposedly Turanian stock, and, through this means, the establishment of political cohesion among these peoples. Within this wider movement Pan-Turanianism is also used to describe in a more definite sense Turkish aspirations toward the creation of a large Turanian state to be constituted of certain closely related Turanian peoples and to operate under the hegemony of the Osmanli Turks in opposition to other races alien to the Turanian stock and particularly to the expansion of the Western Powers in Asia. Pan-Turanianism therefore covers a broad racial and cultural movement which strives toward Turanian racial and linguistic unity and a more concrete political movement. Although the drawing of clear lines of demarcation would be dangerous, differentiation should be made between the wider cultural or truly Pan-Turanian movement and the more concrete Pan-Turkish or Pan-Turco-Tatar movement. In spite of its 10 or more years of existence, the former is still very undefined and represents at best a hazy ideal which faces insurmountable obstacles. Pan-Turanianism is distinct from Pan-Islamism, both from the Turkish variety which existed before and during the War and from the post-war movement for the religious, cultural, and social unity of the Islamic peoples. A large percentage of the Turanians are non-Moslems, and for this reason the protagonists of Pan-Turanianism were forced to substitute for the powerful appeal to religious fanaticism the less potent appeal for racial and cultural co-operation. Notwithstanding this distinction and certain anti-Moslem tendencies in the wider movement, Pan-Turanianism is capable of effective co-operation with Pan-Islamism. This applies particularly to the narrower or Turkish Pan-Turanian scheme which aims at the creation

of a state wherein Islam would be the dominant religion, and which in its appeal to the Moslem Turanians made effective use of the religious motive. If carried to its logical conclusion, Pan-Turanianism would clash irreconcilably with Pan-Islamism. The great obstacles in the way of a realization of the wider Pan-Turanian aims become apparent on consideration of the ethnical groups which are regarded as component parts of the all-including Turanian political and cultural combination. The Turanian family is commonly divided into five groups: (1) the Finno-Ugrians in Scandinavia, Hungary, European Russia, and Siberia; (2) the Samoyeds in northern European Russia and in northern and central Siberia; (3) the Tungus in central and eastern Siberia and Manchuria; (4) the Mongols in Mongolia and the Caucasus; (5) the Turks or Turco-Tatars on the Balkan Peninsula and in Asia Minor, the Caucasus, northern Persia, the Volga region, Russian Central Asia, Russian and Chinese Turkestan, and southwestern, eastern, and northeastern Siberia. These peoples inhabit regions stretching from the North Cape, the Danube, and the Dardanelles to the Sea of Okhotsk and the desert of Gobi. They adhere to such widely different religions as Christianity, Islam, Buddhism, and Shamanism. Although their languages form one linguistic family, they show many and wide differences. Their cultural stages range from the high European culture of the Magyars and the Finns through many variations down to the primitive level of the Samoyeds, Tungus, and Yakuts. For these reasons alone, aside from political and economic considerations, the welding together of these cultural and territorially widely separated groups into one coherent movement seemed a rather fantastic enterprise.

The more practical aspect of the Pan-Turanian movement concerns itself solely with the political and cultural union of the various peoples belonging to the Turkish or Turco-Tatar branch of the Turanian family. Since the Turco-Tatars, with the exception of the Yakuts in Siberia, inhabit contiguous stretches of territory from Rumelia to the border of Mongolia, a Pan-Turanian movement in this limited sense presents a much more feasible programme than the wider movement. These peoples, moreover, are all adherents of Islam, and between them a close cultural and linguistic affinity exists. At the close of the War the Turco-Tatars numbered roughly 26,000,000, of which about 10,000,000 lived in the territory of the existing Turkish state. While union of all peoples of the five Turanian branches is only a fantastic theory, the movement for political, cultural, and religious cohesion between the Turco-Tatars was a practical policy, pregnant with great possibilities. This is chiefly the result of the unsettled conditions which exist in the Near East and Central Asia in consequence of the peace treaties and the Russian Revolution. Turkey, shorn almost completely of her alien subject races, emerged from the War as a compact Turco-Tata state. Smaller in territory but stronger in vitality than the Ottoman Empire, nationalist Turkey abandoned the Caliphate and the old Turkish Pan-Islamic policy, evolved a race-consciousness based on the hardy Osmanli Turk peasant population of the Anatolian plateau, and adopted a Pan-Turanian policy. Instead of aiming at the subjection of the alien races to the Northwest and South, Turkey be-

gan to look eastward, to her Tatar and Turcoman kinsmen. Direct effects of the Russian Revolution, such as the establishment of the independent republic of Azerbaijan and the opening of Russian Central Asia to Turkish influence, brought this policy clearly within the realm of "Realpolitik." In the very obscure and hazy picture which Central Asia presented in the first five years after the War, strong Turkish influences could be discerned at work and there were many indications that a definite policy was being pursued with the view of creating a Turanian federation, to consist of Turkey, Azerbaijan, Turkestan, and Afghanistan. The actual conclusion of treaties by Turkey with Azerbaijan and Afghanistan in 1922 could be considered as a definite step in this direction. At the same time Enver Pasha, who had been branded a traitor by the Kemalists at Angora and who previously had been active in the Caucasus, pursued in Turkestan a Pan-Turanian policy of his own. In 1921 and 1922 he placed himself at the head of Turcoman bands and attempted to establish in this region a Turanian state in opposition to the Central Asiatic policy of Soviet Russia. His defeat by Soviet troops

settled conditions in the Near East and Central Asia. See TURKESTAN, RUSSIAN.

**PAPER.** See CHEMISTRY, ORGANIC.

**PAPER AND WOOD PULP.** The growth in the paper and wood pulp industries during the first 25 years of the twentieth century was extraordinary, and the increased production of printed matter of various kinds was remarkable in most of the civilized countries. The United States ranks first among the paper-producing countries of the world and is followed by Great Britain, Canada, and Germany, in the order mentioned, although other countries contribute wood pulp, which is the basis of the industry. The 1920 world production of paper was estimated at some 14,000,000 tons, of which the United States contributed more than half. In fact the paper and printing industries combined ranked sixth in the general census of United States manufactures taken in 1921. Among the four major groups when considered from the standpoint of product, they were worth \$3,162,732,000, distributed as indicated in the accompanying table, which gives statistics for the census years 1919 and 1921 and, where comparable, for 1914.

and his reported death in 1922 were a temporary setback to the Pan-Turanian movement. Notwithstanding apparent coöperation between Angora and Moscow in Central Asia, for purposes of present-day policy, Pan-Turanianism and communism are fundamentally at variance, and clashes between the two policies based on these doctrines are bound to appear in the future.

At the base of paper manufacturing was the production of pulp, which in 1922 amounted to 3,464,258 tons, or slightly less than the record production of 1920, 3,807,656,000 tons. There are four major grades of pulp, and the proportionate production in the United States from 1914 to 1922 is indicated in the accompanying table.

PRODUCTION OF PULP IN THE UNITED STATES  
(Tons of 20 00 pounds)

| Grades                     | 19 14     | 1919      | 1920      | 1921      | 1922      |

There is more room for harmony between Pan-Turanianism and Pan-Islamism in Central Asia. On the whole the limited Pan-Turanian movement aiming at a union of the Turco-Tatar peoples contained a strong element of realism and had marked political, economic, and cultural possibilities, particularly in view of the un-

The United States does not produce all the wood pulp used in its paper industry, and considerable amounts of sulphite chemical wood pulp, both bleached and unbleached, and sulphate pulp, principally unbleached, are imported from Canada, Sweden, Norway, and Finland. The amount of sulphite imported in 1923 was

712,393 tons, valued at \$48,791,977. This material entered the United States free of duty, and so did the sulphate wood pulp, of which, in unbleached form, 233,503 tons, imported in 1923, were valued at \$15,204,012. The principal quantity came from Canada, which supplied 131,168 tons, as compared with 76,552 tons for Sweden. Of the sulphite in 1923, Canada furnished 299,183 tons, followed by Sweden with 201,023 tons, Finland with 70,665 tons, and Norway with 68,071 tons.

In 1921 the United States Census of Manufactures showed that out of 726 mills in the entire country, New York had 155 and was followed by Massachusetts and Wisconsin with 69 and 62 mills respectively. These three States indicated the geographical distribution of the industry, as the Middle Atlantic States were first in the number of mills, while New England and the Lake States were second and third re-

cept printed matter in the year 1923 aggregated \$25,677,685 in value, of which newsprint accounted for \$1,636,937; book paper, \$3,001,149. Wrapping-paper, paper-board and straw-board, writing-paper, and photographic paper were among the other leading exports. The production of newsprint in the United States and Canada is indicated in the accompanying table, which shows the steady character of the industry in the United States as well as the marked increase in Canada. In the period under review there was an increase in prices which reached a maximum of about \$.0608 in January, 1921, from which it declined to \$.0375 in January, 1923. The increased demand for newsprint was due largely to the great extension of advertising, especially in the daily and Sunday papers, and it was estimated that \$700,000,000 was expended for newspaper advertising alone in 1922.

## NEWSPRINT PRODUCTION IN THE UNITED STATES AND CANADA

(Thousands of tons)

|                     | 1913  | 1914  | 1915  | 1916  | 1917  | 1918  | 1919  | 1920  | 1921  | 1922  |
|---------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| United States ..... | 1,305 | 1,283 | 1,239 | 1,315 | 1,359 | 1,260 | 1,375 | 1,512 | 1,225 | 1,448 |
| Canada .....        | 350   | 415   | 489   | 608   | 686   | 735   | 803   | 876   | 808   | 1,082 |
| Total .....         | 1,655 | 1,698 | 1,728 | 1,923 | 2,045 | 1,995 | 2,178 | 2,388 | 2,033 | 2,530 |

spectively. At the beginning of 1923 there were 1691 paper-making machines with an estimated capacity of 9,560,000 tons per annum, and the normal running time of each machine was stated to be 270 days, about 75 per cent of the actual capacity. It will appear from the following table that the production of paper increased in the United States up to 1920, when the peak was attained with a total output of 7,334,614 short tons. There was a considerable falling off in 1921 due to the carrying over into that year of surplus stock from 1920, and in the years 1922 and 1923 the quantities produced were less, although in 1923 there was an increase in value. The table indicates the distribution of the production for 1914 and the years 1919-22 and also shows the development and production in the various lines.

The Canadian paper industry from 1914 to 1924 developed extraordinarily, not only for newsprint but also for book paper and writing-paper. The newsprint production, which in 1913 had been less than 400,000 tons, had increased to 875,696 by 1920, and after a temporary decline in 1921, reached a maximum of 1,166,225 tons in 1923, of which 1,043,139 tons were exported. The United States took 102,558 tons. For Conservation movement, see FORESTRY.

**PAPINI, GIOVANNI** (1881- ). An Italian writer (see VOL. XVIII). He was the editor of *Lacerba* from 1913 to 1915 and *La Vraie Italie* in 1919. Converted to Catholicism in 1920, he published in the following year a *Life of Christ* which was translated into several languages and had a tremendous sale all over

## ANNUAL PRODUCTION OF PAPER IN THE UNITED STATES

(Tons of 2000 pounds)

| Grades                   | 1914      | 1919      | 1920      | 1921      | 1922      |

Sources: Figures for 1914 from the Bureau of the Census; figures for 1919-22, Federal Trade Commission Summary for 1922.

The United States also imported considerable paper, principally newsprint, which entered from Canada free of duty and in 1923 amounted to 2,617,685,620 pounds, valued at \$98,021,045. Out of total imports of paper of \$116,137,795, the foreign paper entering the United States did not compete seriously with the domestic product as American mills could not supply the great demand for newsprint. In regard to exports, however, American manufacturers do not compete actively on the basis of price but rather on that of quality. The total exports of paper ex-

the world. In 1922 *Four and Twenty Minds* (*Ventiquattro Cervelli*) was published. It was a collection of essays written between 1902 and 1912. In his *Life of Christ* Papini made no attempt to apply any of the learned techniques of modern criticism. He contented himself like a true believer in rewriting the story of the Gospels in an artistic and imaginative fashion. In America the book was highly praised by many clergymen but was at the same time severely criticized by professional scholars. In 1924 Papini was invited to lecture at Columbia Uni-

versity on Italian life and literature, but did not accept. His autobiography, *The Failure*, was translated and published in New York in 1924. See ITALIAN LITERATURE.

**PAPUA.** See NEW GUINEA.

**PAPYRI.** See PHILOLOGY, CLASSICAL.

**PAQUET, ALFONS** (1881- ). A German writer and traveler, born at Wiesbaden, and educated there and at the School of Commerce in London as well as the Universities of Heidelberg, Jena, and Munich. He traveled over the greater part of the world. Of his many works may be mentioned: *Auf Erden* (1906); *Held Namenlos* (1911); *Kamerad Fleming* (1911); *Li Oder im Neuen Osten* (1912); *Limo, der Grosse Beständige Diener* (1913); *Erzählungen an Bord* (1914); *In Palästina* (1915); *Nach Osten* (1915); *Im Kommunistischen Russland* (1919); *Der Geist der Russischen Revolution* (1919); and *Der Rhein als Schicksal* (1920).

**PARAGUAY.** A republic of South America with an estimated area of 196,000 square miles. The population was estimated at 800,000. The capital, Asuncion, had an estimated population of 99,836 in 1920. Other large towns are: Villarrica, 34,500; Concepcion, 25,000; Encarnacion, 16,000. Immigration increased little, in 1920 only 330 immigrants receiving state aid, and in 1921, only 576. In August, 1921, in the 27 National Colonies there was a population of 13,808 of whom 7755 were males. Education was still backward and in 1919 the total school registration was only 80,000 pupils.

**Industry and Trade.** Agriculture and grazing were the leading activities though more than half the total acreage was unexploited. The following products figured in Paraguay's foreign trade in 1922: extract of *quebracho* (used in tanning), 37,799,984 kilos; *quebracho* logs, 1,613,690 kilos; maté (Paraguayan tea), 5,186,587 kilos; oranges, 116,008,267 kilos; tobacco, 4,177,673 kilos. The cattle industry continued to increase up to 1920, there being 5,249,043 cattle in 1916. Other animals included: 600,000 sheep, 478,000 horses, 25,000 asses and mules, 61,000 pigs, and 87,000 goats. In 1922, 299,522 hides were exported and 1,553,572 kilos of jerked beef. Sugar and cotton were receiving greater attention. The sugar production in 1920 was 5230 tons; in 1921, 2579 tons; in 1922, 2400 tons. In 1922, 844,219 kilos of ginned and unginned cotton were exported. The 1922 production of cotton was 7000 metric tons. The country enjoyed great prosperity during the War because of the world demand for meats, but the depression of 1921-22 hit Paraguay particularly because of the low quality of its beef. The result was the absolute disappearance of any market for Paraguayan cattle. The fluctuations are reflected in the following figures (gold peso = \$0.96): imports for 1914, 5,149,000 gold pesos; for 1919, 15,835,970; for 1921, 8,358,922; for 1923, 5,514,245; exports for 1914, 4,584,000 gold pesos; for 1919, 14,816,117; for 1921, 9,316,721; 1922, 9,599,007. The following were the proportions in value by countries of origin of Paraguay's imports: for 1913, Great Britain, 29 per cent; Germany, 28 per cent; Argentina, 13 per cent; United States, 6 per cent. For 1920, 1921, and first half of 1922: Great Britain, 19, 21, and 25 per cent; Germany, 3, 7, and 7 per cent; Argentina, 38, 39, and 36 per cent; United States, 24, 17, and 15 per cent. Many of the imports from Argentina were merely reshipped. The greater bulk of the ex-

ports went to Argentina for reshipment abroad.

**Finance.** The 1913 estimated revenue was 3,248,000 gold pesos and 21,688,000 paper pesos (paper peso worth 7 cents); estimated expenditure was 1,863,000 gold pesos and 48,307,000 paper pesos. The 1922-23 estimated expenditure was 1,011,058 gold pesos and 90,338,252 paper pesos (paper peso worth 3 cents); estimated revenue was 778,116 gold pesos and 99,805,100 paper pesos. On Dec. 31, 1922, the outstanding external debt was \$5,842,692 and the internal debt (including outstanding paper money), \$7,439,180. In 1914, the figures were: external debt, \$3,757,573; internal debt, \$5,091,218.

**History.** Sr. Eduardo Schaerer (1911-15) was the first president in 40 years to complete his term. He was succeeded by Sr. Manuel Franco (1916-19) under whose peaceful administration the country made advances in the development of the packing industry, the products of which, by 1919, became Paraguay's leading export. Sr. Manuel Gondra was elected for 1920-21, but he resigned in 1921, and was succeeded by Dr. Eusebio Ayala. These changes were due to threatened revolts. In 1921, it was announced that Paraguay would not meet her external obligations, with the result that an American financial adviser was called in to render assistance. In 1923, Dr. Eligio Ayala was elected provisional president.

**PARALYSIS, INFANTILE.** See INFANTILE PARALYSIS.

**PARASITOLOGY.** See VETERINARY MEDICINE.

**PARAVANE.** A naval device developed by Commander C. D. Burney of the British Navy. Its earlier form, the explosive paravane, was designed mainly for use against submerged submarines and had many resemblances to the old Harvey towing torpedo. It consisted of two cigar-shaped submerged mines, each carrying an explosive charge and a depth mechanism to insure its sustained immersion at the desired depth. The mines were towed by cables, one on each side of the ship, and were deflected outward by fixed vanes on the shell until the towing cables made an angle of 20° to 60° with the ship's course, depending on the speed. The explosion of the charge took place if the hull of a submarine or the shell of a mine were struck or if a firing key on the bridge were pressed. In the later type, the torpedo-shaped floats, or "otters" as they were called, carried no explosive charge but were fitted with saw-like jaws for cutting mine-anchor cables. The towing rope was attached to the stem of the ship a dozen feet or more below water. Any mine which did not squarely strike the stem of the ship was caught by one of the towing ropes pressing against the anchor line. The latter slid along the towing rope until it reached the "otter's" jaws, where it was instantly cut. The mine then rose to the surface clear of the ship and could be easily destroyed by gunfire. This type of paravane was eventually fitted to all large warships and merchant steamers. Paravanes saved many vessels from being sunk by mines and revealed the location of several new and unknown mine fields. They were also used for mine-sweeping and in searching for mine fields. See MINE, SUBMARINE.

**PARIS.** See WAR IN EUROPE, *Western Front*.

**PARIS CONFERENCE.** See PEACE CONFERENCE AND TREATIES.

**PARK, JULIAN** (1887- ). An American educator, born at Buffalo, N. Y., and educated at Williams College and the Paris, Columbia, and Minnesota Universities. He was assistant director of the Buffalo Fine Arts Academy from 1911 to 1913 and in the latter year was appointed instructor in French at the University of Buffalo. He was successively instructor in history, professor of history, and department head, secretary of the College of Arts and Science, and dean. The last office he held after 1918. He was a member of many historical and learned societies and was the author of *Philatelic Rambles* (1912); *History of the University of Buffalo* (1917); *Subject Peoples under the Teutons* (1918); and *Cuba in the Seven Years' War* (1920). He was a frequent contributor to *The University of Buffalo Studies*.

**PARK, WILLIAM HALLOCK** (1863- ). An American bacteriologist, pathologist, and sanitarian, born in New York City, and educated in the College of the City of New York and Columbia University. In 1897 he was made professor of bacteriology and hygiene in the Bellevue-University Medical College, and after the death of Egbert Lefevre, dean of the faculty there. In 1894 he had been appointed director of the bureau of laboratories of the New York Board of Health. In 1900 appeared his textbook, *Bacteriology in Medicine and Surgery*, while in 1910, in collaboration with Williams, he published *Pathogenic Microorganisms*, which passed through 7 editions in 10 years. He edited the reference work *Public Health and Hygiene* (1920) and was a voluminous contributor, alone or in collaboration, to the periodical press, with special reference to diphtheria and typhoid fever.

**PARK COLLEGE.** A nonsectarian institution at Parkville, Mo., founded in 1875. The size of the college remained approximately the same during the decade between 1914 and 1923-24, with an enrollment of 412 students, a faculty of 24, and a library of 25,000 volumes in the former year, compared with an enrollment of 443 students, of whom 94 were in the preparatory school, a faculty of 28, and a library of 30,000 volumes in the latter. Several buildings were put up, including the president's residence, a men's dormitory, a lighting and heating plant, and a Carnegie Library, as well as a science building which was in course of construction in 1924. The endowment fund was about doubled. President, Frederick William Hawley, D.D., LL.D.

**PARKER, SIR GILBERT** (1862- ). An English novelist (see Vol. XVIII). From 1900 to 1918 he was a member of Parliament from Gravesend. He was created a baronet in 1915. During the first two years of the War he had general charge of British publicity in the United States and in this capacity did excellent service in creating favorable sentiment in behalf of the Allies. His later books include: *You Never Know Your Luck* (1915); *The World For Sale* (1916); *Wild Youth* (1919); *No Defense* (1920). He also wrote, in 1915, *The World in the Crucible*, a book on the War.

**PARKS, NATIONAL.** Congress created in August, 1916, the National Park Service, which placed the national parks and monuments in the Department of the Interior, under the general charge of a director. The act provided also that the Secretary might make rules and regulations for the use and management of the reser-

vations and prescribe punishment for the infraction of such rules and regulations. Up to 1916, 16 parks had been created; the latest up to that time were the Hawaiian National Park in the Territory of Hawaii and the Lassen Volcanic National Park in Northern California. A bill was introduced into Congress in 1916 for the establishment of Mt. McKinley National Park in the Territory of Alaska. A tract of land in 1916 was given by citizens of Maine to the Government of the United States. It has an area of 10,000 acres, on Mt. Desert Island. It was given by President Wilson, the name of Sieur de Montes National Monument, but in 1919 Congress renamed it Lafayette National Park. The number of visitors to the national parks steadily increased during the decade. In 1918 there were 451,691 visitors; in 1920, 1,058,455. In view of the increasing interest and importance of the national park system, the attempts of private irrigation and water power system interests to obtain control gave serious concern to the authorities during the decade. Among the various projects considered likely to injure the parks was that for a dam at the outlet of Yellowstone Park. The formal dedication of the Grand Canyon of Colorado as a national park took place on Apr. 20, 1920. In the year 1921 visitors to the national parks numbered considerably over 900,000, while the visitors to the national monuments numbered 164,461. The first national conference on State parks was held in 1920 at Des Moines, Iowa. The purpose of the movement is to preserve places in the various States and to maintain them under State control as centres of health, recreation, and education. As a result of the conference, several States which heretofore had no State parks undertook the first steps to secure them. The Hawaiian National Park was formally dedicated on July 9, 1921. This is on the rim of the crater of Halemaumau. The park contains two active volcanoes, Kilauea and Mokuawewe. Bills were introduced in Congress during this year for national parks in Utah; the Mammoth Cave in Kentucky; Mt. Katahdin, Me.; Mt. Baker, Wash.; Mt. Battell, Vt.; Kill Deer Mountain, N. D.; and Roosevelt National Park, N. D. There were also several proposals for national monuments in Colorado, Washington, Nevada, and other States. The visitors to the parks in 1922 numbered 1,216,490. This year marked the fiftieth anniversary of the establishment of Yellowstone Park, the first of its kind in the world. During this year, legislation was passed adding to the area of Mt. McKinley Park in Alaska and to that of Hawaii National Park. Bills were also introduced for the establishment of other parks in Washington, Arkansas, South Dakota, Virginia, and Georgia. A movement was undertaken to increase the area of the Sequoia National Park in California and to change its name to the Roosevelt-Sequoia. No action was taken by Congress. The number of visitors in 1923 (1,280,886) again exceeded that of the previous year; while visitors to the national monuments numbered 212,826. The movement to save the great redwoods of California which was carried on throughout the decade received fresh impetus during 1923 by the action of the California Legislature, which passed, in May, a law calling for a survey of all timber lands available for park purposes by the State Forestry Board. Congress in 1923 empowered the Secretary of the Interior to obtain complete

title to any or all of the private holdings within Glacier National Park, by exchanging them for other public lands of equal value in Montana. Bills were introduced for the Appalachian National Park in Virginia and the Lincoln National Park in Kentucky, Tennessee, and Virginia. By presidential proclamation, new national monuments were established at Fossil Cycad in South Dakota; Aztec Ruin in New Mexico; Hovenweep in Utah and Colorado; and Pipe Spring in Arizona. In addition, the Bryce Canyon National Monument and the Timpanogos Cave in Utah were established under the Department of Agriculture, and the Mt. City Group National Monument in Ohio under the War Department.

**PARMOOR, CHARLES ALFRED CRIPPS**, first BARON (1852- ). An English lawyer, educated at Oxford. He was one of the most prominent laymen of the Church of England. Elected to Parliament in 1895, he was a Conservative in politics but later broke away from his party because of his free trade ideas. He supported Labor, became a strong believer in the League of Nations, and was appointed by Prime Minister Ramsay Macdonald as Lord President of the Council in his cabinet, where he was responsible for matters arising out of Great Britain's membership in the League of Nations. He published *Principles of Compensation and Laws of Church and Clergy*.

**PARODI, DOMINIQUE** (1870- ). A French philosophical writer, disciple of Renouvier and Hamelin. He published in 1919 a comprehensive survey of contemporary French philosophy (*La Philosophie Contemporaine en France, Essai de Classification des Doctrines*). His other works include *Le Problème Moral et la Pensée Contemporaine* (1910) and *Traditionnalisme et Démocratie* (1909).

**PARSONS, FRANK ALVAH** (1868- ). An artist and critic born at Chesterfield, Mass., who studied art in Italy, France, England, and Austria. He has published many books on art, including *Principles of Advertising Arrangement; Interior Decoration, Its Principles and Practice; The Psychology of Dress; The Art Appeal in Advertising Display*. He was co-author of *Advertising, Its Principles and Practice*, and *Art, Its Principles and Practice Applied to Modern Life*. Besides writing books on art he has delivered lectures in many parts of the United States and written articles and pamphlets on art subjects. He was president and director of the New York School of Fine and Applied Art, after 1905, and one of the most influential art educators in the United States.

**PASHITCH, NIKOLA** (1844- ). A Jugo-Slav statesman. For over 50 years he was one of the leading political figures in the Balkan states and was Prime Minister of Serbia more than 12 times. He was twice imprisoned for refusing to lend himself to the former Obrenovitch dynasty in behalf of Austria-Hungary. He was one of the most prominent figures at the Peace Conference in Paris, where largely through his efforts the kingdom of Jugo-Slavia was established. In 1923 an unsuccessful attempt was made on his life. His negotiations with Italy settled in 1923 the long-disputed Fiume question. See JUGO-SLAVIA.

**PASSY, PAUL EDOUARD** (1859- ). A French philologist who has made a special study of phonetics (see VOL. XVIII). His later publications include: *Phonetic Reader* (1915);

*Premier livre de Lecture* (1917); *Lectures Françaises Phonétiques* (1918), and *Conversations Françaises en Transcription Phonétique* (1919).

**PASTOR, LUDWIG** (1854- ). A German historian (see VOL. XVIII). He lives in Innsbruck and in Rome. His publications during the decade 1914-24 were: *Conrad von Hötzen-dorf* (1916); *Generaloberst von Danke* (1916); and *Der Staat Rom zu Ende der Renaissance* (1916). He edited *Johannes Janssens Briefe* (1922).

**PATERSON**. A manufacturing city of New Jersey. The population increased from 125,600 in 1910 to 135,875 in 1920, and to 139,579, by estimate of the Bureau of the Census, for 1923. A comprehensive zoning ordinance was adopted in 1921, providing for four residence and two business districts and a light and a heavy industrial district. Four modern school buildings were completed, 1914-1924, and in the latter year a \$1,250,000 high school was in process of construction. The number of manufacturing plants increased from 702 in 1909 to 1200 in 1923, and the value of their output from \$67,000,000 to \$225,000,000. Paterson is the leading silk manufacturing centre in the United States. About 30,000 persons were engaged in the silk manufacturing industry alone in 1924. Bank resources rose from \$43,000,000 in 1914 to \$110,952,976 in 1924.

**PATTERSON, JOHN THOMAS** (1878- ). An American zoölogist, born at Piqua, Ohio, and educated at Wooster University and the University of Chicago. He was professor of biology at Buena Vista College (1903-05); assistant in zoölogy at the University of Chicago (1905-08); and instructor (1908-11), adjunct professor (1911-13), and professor (1913- ) at the University of Texas. He published articles in zoölogical journals on the embryology of the armadillo and on polyembryony in insects.

**PAUL TEST**. See SMALLPOX.

**PAVEMENTS**. See ROADS AND PAVEMENTS.

**PAYNE, GEORGE HENRY** (1876- ). An American writer, born in New York City, and educated at the College of the City of New York, the College of Pharmacy, and the New York Law School. He was for many years engaged in newspaper work in New York City and took an active part in politics as manager of campaigns for several candidates. In 1917 he was appointed New York City's representative on the State Council of Defense and organized the Committee of American Business Men in 1919. His books include *History of the Child in Human Progress* (1915) and *History of Journalism in America* (1919). In 1920 he purchased *The Forum*.

**PAYNE, JOHN BARTON** (1855- ). An American public official, born at Pruntytown, Va., and educated at Orleans, Va. He began to practice law in West Virginia in 1877. He was active in politics and in 1882 was elected mayor of Kingwood, W. Va. He moved to Chicago in 1883. He was appointed judge of the Superior Court of Cook County, Ill., holding the office for five years. He was appointed general counsel of the United States Shipping Board Emergency Fleet Corporation in 1917 and to the director general of railroads in 1918. He held the post of Secretary of the Interior in President Wilson's cabinet from February, 1920, to Mar. 4, 1921. He was made chairman of the American Red Cross by President Harding on Oct. 1,

1921. In April, 1923, he was one of two commissioners appointed by President Harding to confer with representatives of Mexico with a view to American recognition of Mexico. The negotiations were opened in May, and after weeks of discussion in regard to damage claims, boundary disputes, and the holding of oil and agricultural lands by foreigners, matters were arranged, and recognition consummated by Aug. 31, 1923.

**PEABODY MUSEUM OF HARVARD UNIVERSITY.** The museum continued active work during the decade 1914-24. Expeditions were sent out in 1915 to the Canary Islands, the Libyan Desert, and Arizona. Researches were continued also in Central America and the Delaware Valley and other parts of the United States. During 1916 the museum was engaged in preparing for publication the first number of the *Harvard African Studies*, six volumes of which were published up to 1924. Much valuable material was received from the Aoren Arctic Expedition to northern Siberia. In 1917 the Central American Expedition continued its work and made discoveries of large groups of ruins in Honduras and Guatemala. Field work was carried on in the cliff-house region of northeastern Arizona. The seventh volume of the museum papers dealing with the history of the Spanish conquest of Yucatan was issued. Two of the five large exhibition halls in the new section of the museum were opened to the public. After the entry of the United States into the War, the active work of the museum was largely suspended, but in 1918 an expedition was sent to the Vancouver Islands to study Indian remains there. Explorations were also carried on in various parts of the United States. The normal activities were gradually reestablished during 1919, but little field work was carried on. Several valuable collections were received, including the Bates Collection from the shell heaps of Maine. The museum issued several important publications during this year. The field work in 1920 was confined chiefly to Arizona and Africa. Much important material relating to the cliff dwellers was collected. In 1921 extensive field work was conducted in various fields. An expedition to Central America visited ruins in northern Yucatan and continued investigations into northern Guatemala. Explorations into Arizona were continued, and researches were carried on in France and Belgium. Considerable additions were made to the collections of the museum by purchases and gifts in 1922, and important rearrangements and exhibits were made. Field work in Central America was prosecuted during the year, and the expedition to Arizona continued its investigations. In 1923 the Central American expedition spent three months in Yucatan, Honduras, and Guatemala. One of the results of this work was the discovery of an ancient culture previously unknown to scientists. Valuable collections were received from the New Hebrides group, and the museum received the Theodore N. Vail collection of stone implements.

#### PEACE CONFERENCE AND TREATIES.

A task of world-wide reconstruction and readjustment confronted the statesmen and diplomats of the victorious Allied and Associated Powers at the end of the Great War. To arrange a settlement of the problems of peace a whole series of conferences has been held from 1919 to 1924 and the results of their delibera-

tions have been registered in numerous agreements, treaties, protocols, and conventions, or have silently woven themselves into the very warp and woof of human society. During the War the Allied cause in general had represented "a most curious combination of lofty idealism with an undercurrent of selfish ambition." The openly avowed ideals were usually at utter variance with the more sordid ulterior aims. "Practical" men—nationalists, imperialists and militarists—insisted that the immediate problem was to punish Germany and her allies for their atrocious crimes against civilization, to exact the greatest possible indemnity, to reduce the Central Empires to military impotence and so to cripple German industry and commerce as to make impossible any effective or dangerous competition by her in the future economic development of the world. The German colonies and the Turkish Empire were to be divided up among the victors and the litigious estates of the Habsburgs liquidated to satisfy the nationalistic aspirations of Italy and the smaller Allies. Most of these aims had been embodied in the secret engagements and commitments negotiated by the various European Allies and Japan at intervals during the years 1915, 1916, and 1917, before the United States entered the War. In regard to Turkey secret discussions continued unabated throughout the conflict and at the time of the Peace Conference in 1919 Lloyd George and Clemenceau were still haggling silently but strenuously over the division of the spoils. These secret treaties constituted a comprehensive programme for dividing up the world, a hard and fast basis for the final peace settlement. They "were destined to bear a crop of suspicion, controversy, balked ambition, which twice at least, nearly wrecked the Peace Conference, poisoned its discussions, and warped and disfigured its final decisions."

Entirely opposed to the plans of settlement represented in the secret treaties were the openly voiced aspirations of numerous liberal and labor groups in the various belligerent countries. Some of the statesmen who professed idealistic motives were sincere in their convictions; others utilized idealism as a cloak for their activities while engaged in forging the chain of secret treaties. Yet their utterances outwardly imparted to the Allied cause during the last few years of the War all the moral elevation of a crusade for human righteousness. In particular the various addresses of Woodrow Wilson, President of the United States, served to clarify the fundamental issues of the War and to provide a set of legitimate aims and guiding principles for the inauguration of a more enlightened era of international peace and coöperation. From 1917 on Mr. Wilson enjoyed an unparalleled prestige and influence in the public opinion and counsel of the world. The principles of his war-aims addresses of 1918 were the official basis of the pre-armistice terms agreed upon with Germany and her associates. These terms were binding on all parties and constituted in a technical sense the legal basis of the peace settlement. With two qualifications the Allied Powers bound themselves to impose no conditions of peace inconsistent with Mr. Wilson's "Fourteen Points" of January 8, his "Four Principles" of February 11, his "Four Ends" of July 4, and his "Five Particulars" of September 27. Judgment was reserved by the Supreme War Council on the second of the Fourteen Points relating to the

UNIVERSITY OF ILLINOIS

"freedom of the seas"; this was declared to be open to various interpretations some of which they were unable to accept. In addition it was expressly stipulated that the demands for the restoration of territories invaded by Germany should include compensation for all damages done to the civilian populations of the Allied countries by land, by sea and from the air. The Armistice signed with Austria and Hungary was unconditional as finally agreed upon, yet the preceding diplomatic exchanges between the Austro-Hungarian and American governments had created, if not a legal, at least a strong moral obligation to arrange peace upon the basis of the President's addresses except in regard to Point Ten, which was modified by Wilson himself to assure complete and unconditional self-determination to the Czecho-Slovaks and Jugo-Slavs hitherto incorporated in the Dual Monarchy. With Bulgaria and with Turkey Mr. Wilson entered into no negotiations at all, but the Fourteen Points touched upon their cases.

The two months which elapsed between the signing of the Armistice with Germany (Nov. 11, 1918) and the first meeting of the major Allied plenipotentiaries in Paris (Jan. 12, 1919) were marked by extremely significant developments throughout the world. The contemporaneous revolutions in Central Europe which resulted in the establishment of democratic republics in Germany, Austria, and Hungary failed to effect any considerable change in the attitude or plans of the Allies. In Italy a tremendous wave of nationalistic feeling overwhelmed all efforts of liberal and socialist leaders to pledge the support of that country to a peace of conciliation. A ministerial crisis was precipitated in late December and early January, but with the resignation of socialists and moderates, the imperialist group headed by Premier Orlando and Foreign Minister Sonnino strengthened its grip upon the government. In France Premier Clemenceau, unmoved by socialist attacks, announced his intention of securing the utmost possible security and indemnification for France together with the maintenance of the old system of alliances. His government received an overwhelming vote of confidence as he thus threw down the gage. In Great Britain, Parliament was dissolved in November and a general election held on December 14. Premier Lloyd George, discarding the liberalism of his war-aims speech of Jan. 5, 1918, made the issue of his campaign a hard and bitter peace. His platform included recovery of the entire costs of the War—"shilling for shilling and ton for ton"—and punishment of war criminals. The result was a stupendous triumph for his Coalition which secured a majority of over 260 seats. The Labor party advocating a Wilsonian peace secured 61 seats and became the Official Opposition.

President Wilson could point to no such popular mandate or parliamentary vote of confidence. Indeed, despite his appeal to the American people for support in the shape of a Democratic Congress, the elections of November 5 had returned small Republican majorities in both the House and the Senate. Republican leaders in office and out were bitterly attacking the President's policies. Ex-President Roosevelt was particularly vehement. He openly asserted that Mr. Wilson had no authority whatsoever to speak for the American people as his leadership had just been emphatically repudiated by

them. It was the duty of the Allies to impose their common will upon the nations responsible for the hideous disaster which had almost wrecked mankind. Mr. Roosevelt's manifesto harmonized perfectly with the purposes and plans of Clemenceau and Sonnino. Notwithstanding the fact that recent electoral reverses had thus seriously discredited his leadership at home, Mr. Wilson, against the advice of Secretary of State Lansing, made the momentous decision to go abroad as head of the American commission to negotiate peace. He was animated by a sincere determination to work for the incorporation of his ideals into the substance of the peace treaty, to see to it that no false or mistaken interpretation was put upon them and no possible effort omitted to realize them. He claimed to be under no illusions as to the difficulty of realizing his programme. Arriving in France on December 13, Wilson found that although the date for the Peace Conference had been set for the 17th a month more was to elapse before real work began. He spent the interval visiting the various Allied countries, conferring with statesmen and making speeches, being warmly received by liberal and radical elements which gave whole-hearted support to his reiterated proposals for a peace of justice.

#### THE PARIS PEACE CONFERENCE

The five Principal Allied and Associated Powers which had contributed most to the winning of the War assumed supreme charge of arranging the Peace. It was early decided to exclude the enemy powers from the impending Congress until preliminary terms had been agreed upon among the Allies. Paris—the shell-shocked nerve-centre of Allied resistance to Germany—was selected as the scene of the Preliminary Conference. Here on Jan. 12, 1919, there finally convened a meeting of the Supreme Council, its membership now comprising the chief executives of Great Britain, France, Italy, and the United States, together with their respective foreign ministers. Two Japanese representatives were admitted on the following day and this "Council of Ten," as it came to be known, definitely inaugurated the work of the Peace Conference and continued to dominate the course of events until the middle of March when it was transformed into the "Council of Four" and a subordinate "Council of Five."

**Organization.** Quickly the Council of Ten proceeded to the organization of Peace Conference machinery. Thirty-two states which had been at war with Germany or had severed diplomatic relations with her were admitted to membership in the plenary Conference, though with varying degrees of representation. Adopting a middle course between the proposals of the extreme militarists who advocated a body made up of delegates from the Great Powers alone which should frame a treaty to be imposed on smaller Allied States and enemy powers alike, and the proposals of the extreme legalists who championed the theoretical equality of nations with uniform representation for all, the Supreme Council apportioned plenipotentiaries to each on the basis of size, military power and prestige and service or suffering in the recent War. Of the 70 officially authorized plenipotentiaries five were assigned to each of the Great Powers—France, Italy, Japan, Great Britain and the United States; three each to Belgium, Brazil, and

Serbia (later officially recognized as Jugoslavia); two each to Australia, Canada, China, Czecho-Slovakia, Greece, Hedjaz, India, Poland, Portugal, Rumania, and Siam; and one apiece to Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, New Zealand, Nicaragua, Panama, Peru, and Uruguay. While thus allocating the formal representation for plenary sessions, the Council of Ten reserved to itself the power of determining the course of procedure, conducting preliminary deliberations and making the really important decisions. The plenary sessions were to prove almost entirely devoid of any significance save the ceremonial function of ratifying and registering decisions already made. On January 18, at the first plenary session, Premier Clemenceau of France, who presided at meetings of the Supreme Council, was elected as President of the Conference.

In addition to formally authorized participants in the Conference, streams of uninvited and sometimes unwelcome guests from all parts of the world converged upon Paris, in the hope of securing a hearing or at any rate of arousing interest in the aims and ambitions of their respective nationalities. Armenians, Syrians, Georgians, Ruthenians, Estonians, Lithuanians, Letts, Finns, Albanians, Persians, Egyptians, Koreans, Zionists, Schleswigers, Aland Islanders, Irish-Americans, Negroes, and others came to present ex-parte evidence and plead for justice. "Never before had Europe witnessed such a gathering of rulers and rivals, of realists bent on material gains and idealists striving for a happier world." Realists and idealists alike usually met with disappointment. Small nations were to be allowed to present their cases; even neutrals were to be heard in matters specifically affecting their interests; but the real power was to rest with the chief representatives of the five largest states.

To assume, however, that the treaties emanating from Paris were drafted by a small group of men—the "Ten," the "Four," or the "Three"—and that the terms were fixed by them would be highly erroneous. Each delegation at the Conference had a numerous staff of territorial, ethnographic, and historical specialists, economic advisers and other experts, and these together with the plenipotentiaries supplied the personnel for some 58 technical commissions constituted during the first six months of 1919 to make preliminary investigations and reports on various problems of the settlement. These commissions held over 1600 meetings and their conclusions and recommendations were discussed by the Council of Ten, which held 72 meetings, the later Council of Four, which held 145 sessions, and the subordinate Council of Five, which met 39 times. Most of the articles in the treaty were taken bodily, without change, from the reports of commissions.

Wilson's First Point declaring for "open covenants openly arrived at" was seriously vitiated at Paris. Despite a keen struggle waged by the Americans for a wider measure of publicity, only the plenary sessions of the Conference were opened to the press. Lloyd George, Clemenceau, and Orlando uniting to demand that the executive councils deliberate in secret, it was decided and announced that publicity with regard to their proceedings "must be subject to the limitations necessarily imposed by the difficult and delicate nature of their object." The army of newspaper correspondents was obliged

to be content with brief and non-committal communiqués issued each day, the scanty substance of which had to be supplemented with the gleanings of gossip, semi-official conferences with directors of publicity appointed by each delegation, and occasional interviews with important plenipotentiaries. But in devious ways and for ulterior purposes reports of secret proceedings frequently reached the printed page, garbled, perhaps, to advance the interests of those who instigated publication.

"The Big Four." In addition to running the conference machinery and determining final terms of peace, the members of the Supreme Council were burdened with complicated and urgent tasks of administration. Each leader had to consider public opinion and political developments at home, problems of demobilization and economic readjustment. The armistice terms with Germany had to be renewed, measures taken to combat the spread of Bolshevism, and to feed, clothe, and house refugees in a dozen regions of Europe. Eastern Europe was in chaos, Central Europe was in revolution, and Western Europe trembled on the verge of exhaustion and collapse. Everywhere the various nationalist groups were attempting to anticipate the decisions of the Conference by seizing as wide an area of debatable territory as possible. At one time American observers counted as many as 14 small wars raging in various parts of Europe. The maintenance of political stability and the restoration of economic processes to more normal functioning had to be accomplished in the face of nationalistic quarrels and social unrest that threatened to plunge all Europe into renewed anarchy and to spread the tenets and tentacles of communism westward to the Rhine and the Adriatic.

The position of Woodrow Wilson and his American colleagues was at once highly advantageous and supremely difficult. Mr. Wilson enjoyed great prestige as the head of a wealthy, powerful, and influential nation. The moving eloquence of his lofty declarations on the issues of the Great War and the principles of a lasting settlement together with his vigorous advocacy of a league of free nations cooperating in the fruitful processes of peace had earned him a numerous following among liberal and labor elements the world over. His programme for world settlement had been officially endorsed as the basis of peace at the time of the armistice negotiations, and he came to Paris determined to secure the application of the twin principles of national self-determination and international coöperation.

But speaking broadly one may say that the representatives of the other Allied Powers did not view with entire favor the policies of Mr. Wilson. They might with diplomatic tact, with reassuring cordiality, agree with Mr. Wilson "in principle," yet their manifest purpose was to negative his projects in detail. Throughout the long negotiations during the first six months of 1919 with the endless proposals and counter-proposals, discussions, and decisions, the central ideas of the leaders of the different delegations, except possibly the British, remained fairly consistent. Premier Clemenceau of France, in addressing the assembled plenipotentiaries on January 18, announced that the principles of the peace had been laid down by President Wilson and adjured all to work quickly and well. Yet there was not in Paris a more persistent or dogged opponent of Mr. Wilson's

ideals and policies than Clemenceau. A statesman and politician of the realist school, steered by half a century's experience in French politics, he was cynical of the idealism which had been so widely extolled. Being utterly convinced that the Germans understood nothing but force, he made no pretense of being bound by the Fourteen Points. His one interest was his beloved France and his one dominating purpose the demolition of Germany and the achievement of security for France. "The French position at Paris was set forth and defended with matchless ingenuity and obstinacy. . . . Foch had a military plan of safety, Bourgeois a diplomatic plan, Loucheur and Klotz an economic plan, but the coördination between them was perfect and Clemenceau was the supreme strategist of the entire campaign."

David Lloyd George, the leader of the British delegation, was perhaps the most unstable character at the Conference. No plenipotentiary ever approached the task of readjusting a shattered international order with a more slender equipment of detailed knowledge and though he possessed the capacity of acquiring effective information at lightning speed, he seemed to have no guiding principles. Leaping nimbly from extreme to extreme—a human barometer charged with Celtic quicksilver—he seemed to live in constant apprehension of parliamentary repercussions. Guided by the dictates of expediency alone, Lloyd George sought always to advance the interests of the British Empire, to prevent the French from getting too much, to render Germany incapable of offense by land or sea, to make her pay for the War up to the measure of her ability, and to surrender her war criminals, yet not to impose terms of such severity that the German government would refuse to sign. The surrender of the German fleet had already secured Great Britain in the supremacy of the seas and this the British determined to maintain. They had specifically reserved approval of Mr. Wilson's Second Point relating to the "freedom of the seas" and it was a distinct concession to their susceptibilities that so little discussion of this subject took place at Paris. Outside of that the main interest of the British was in the disposition of the former German colonies and the dismemberment of the Turkish Empire. Here their claims clashed both with rival French and Italian interests and with Mr. Wilson's principles. Subject to these modifications and exceptions the British tended to favor a League of Nations.

Equally distrustful of the Wilsonian programme of peace and equally importunate in their demands for territorial cessions were the Italians represented in Paris by Premier Orlando and his foreign minister, Sidney Sonnino. Though less powerful than their colleagues, these Italian delegates, supported by a strong nationalist and imperialist sentiment at home, determined to complete Italian national unification, obtain strategic security and imperial aggrandizement on the north and in the Adriatic, and share more largely, even though at French and British expense, in the political control and economic exploitation of Africa and Asia Minor.

The Japanese plenipotentiaries came to Paris with two major aims: first, a more complete recognition of the status of their nation as a Great Power on a plane of equality with the others, and second, acquisition of Shantung and the German islands in the North Pacific Ocean.

Sphinx-like and reticent they participated but little in the resettlement of Europe, but where their own interests were involved they stood ready to fight for their claims even to the extent of threatening to leave the Conference.

In addition to these aims and interests of the Great Powers there was another grave obstacle to the realization of a Wilsonian peace, namely, the inordinate ambitions and conflicting claims of the smaller nations now newly vindicated, emancipated or unified. The representatives of Belgium, Paderewski (the pianist premier of Poland), Bratiano of Rumania, Pasitch of Serbia, and the gifted Venizelos of Greece, all asked for territory which could only be assigned to them on the inveterate, but, to Wilson's mind, iniquitous principle of the division of the spoils among the victors. It was partly because of these overweening pretensions on the part of the smaller states that Wilson agreed to their exclusion from the Supreme Council of the Allies which directed the Conference.

**The Russian Problem.** The vexatious and long unsolved problem of Russia rose to confront the Supreme Council during the early weeks of the Conference. The danger of Bolshevism loomed large on the Eastern horizon, for despite the ring of domestic and foreign enemies which surrounded them the Communists had managed to maintain their position. Though they were generally regarded as traitors and outlaws, the inherent difficulties of the problem of dealing with them were rendered still more complicated by the divergent aims and sympathies of the Allies. Early in January, the French, mindful of the billions of francs which they had invested in Russia, urged the utilization of the combined resources of the several countries to overthrow the Bolshevik régime; but the United States and Great Britain refused to furnish any troops for this enterprise. President Wilson strongly opposed Foch's plan for sending troops to Poland, saying he had great doubts whether the spread of Bolshevism could be checked by the use of armed force. He and Lloyd George suggested a plan for holding a conference with the various Russian factions including the de facto Bolshevik government. Clemenceau refusing to have his capital contaminated, the place and date of meeting were set for the island of Prinkipo in the Sea of Marmora in February, but to the ill-concealed joy of the French the project fell through owing to the contemptuous refusal of the counter-revolutionary leaders Denikin and Kolchak to consider any proposal for a truce and a conference. During the several subsequent months the British and the Americans, recognizing the danger of a policy of drift, persisted in their endeavor to make some sort of a settlement regarding Russia, but due to diplomatic tactlessness on the part of the Bolsheviks, hostile comment in the Allied press, the vacillation of Lloyd George in the face of this comment, and the unbending rigor of official France, nothing was accomplished, and the Allies finally reverted to the policy of supporting the royalist counter-revolutionists. Much valuable time had been wasted and meanwhile the tide of Bolshevism seemed to be sweeping irresistibly westward, into Hungary, into Austria, into Bavaria. The Conference lived throughout under the menacing shadow of impending revolution.

**The League of Nations.** One of the earliest and perhaps the most vital of the many struggles

at the Peace Conference was the effort to bring into being a League of Nations and relate it definitely to the Treaty of Peace. (See LEAGUE OF NATIONS.) The French were desirous of postponing consideration of a League until the material problems of peace had been settled—new states, boundaries, colonies, disarmament of the enemy, and indemnity. But Wilson placed the league project first on his list of subjects, and in compliance with his demand the Council of Ten passed a resolution on January 22, sanctioning the creation of a League which should be incorporated "in the general treaty of peace." This resolution was approved by the second plenary session on January 25, and a commission constituted to draft a covenant for the proposed league.

On January 23 Lloyd George, supported by Clemenceau and Sonnino, precipitated an acrimonious discussion of the disposition of the German colonies and the dismemberment of Turkey, which consumed the greater part of a week and generated much heat and bitterness. German sea-power and economic rivalry having been crushed, the British moved quickly to their next objective—the division of the spoils of war. Wilson vigorously opposed the move, but had to compromise. It was agreed (January 24) that the colonies should not be restored to Germany, though on the question of future control grave differences of opinion developed. The British premier and the Dominion prime ministers demanded outright annexation of the territories which the secret treaties assigned to the British Empire. On the 27th, the Japanese announced their unconditional claim to Shantung and the North Pacific islands as per secret treaty engagements. On the 28th, the French demanded annexation "pure and simple" of Togoland and the Cameroons, basing their claims in part upon the existence of secret arrangements with Great Britain and requesting that France "be allowed to continue her work of civilization in tropical Africa." Belgium presently intimated a desire for territorial increases in Africa, and Italy put forward provisional claims based upon the secret treaty of London. Wilson adhering to his programme of "self-determination" with "no annexations" proposed that the areas in question should be held in "trusteeship by the League of Nations through the appointment of mandatories." Smuts of South Africa had originally proposed the application of the mandatory principle to the Turkish and Habsburg Empires, but Wilson in adopting his suggestion widened its application, thereby incurring bitter attacks in the French press which denounced him and his "impracticable ideals." The British shifted their attack, accepted the mandatory scheme in principle and attempted to have a preliminary allocation of colonies made before the League came into existence. Hughes of Australia and Massey of New Zealand now uttered a virtual ultimatum, but Wilson stood adamant, and consideration of the problem was postponed pending the drafting of the League Covenant, work upon which was expedited during the first two weeks of February. Simultaneously other commissions which had been appointed, such as those on various territorial problems, responsibility for the War, reparations, etc., immediately commenced their arduous task of preparing the formulas of settlement.

Following the plenary session of February 14, there was a month's interregnum due to the

absence of the "Big Four." Lloyd George was absent from the Conference from February 7 to March 5. His place was temporarily taken by Winston Churchill, perhaps the most militaristic and ultra-imperialistic member of the British cabinet. Mr. Wilson, who left for America on February 14, to attend to administrative duties, did not return to Paris until March 14. Premier Clemenceau, wounded by a French anarchist on February 19, was confined to his home until March 10. Premier Orlando went to Italy for some time leaving his more reactionary colleague Sonnino in control.

During the week before his departure, especially on February 7, and February 12, Wilson advocated the immediate imposition upon Germany of military and naval terms providing for her disarmament as a preliminary preparation for Allied demobilization. This would separate military terms from general considerations of peace and tend to remove the Conference from the militarist atmosphere created by the maintenance of large standing armies. Clemenceau bitterly denounced this plan. He desired expansion of the old conditions for Germany but not demobilization for the Allied armies. Balfour of Great Britain supported the President in resolutions renewing the old armistice terms for an indefinite period and providing for a preliminary treaty containing the military, naval and air terms to be drafted immediately by a committee of military experts during Wilson's absence in America. But those delegates who favored imposing general territorial and reparation terms on Germany before considering a League of Nations took advantage of the situation to sidetrack the League project and work for the expansion of the preliminary military, naval and air treaty authorized by the resolution of February 12, into a general settlement. On February 22, Mr. Balfour, responding to pressure by Churchill, introduced a new resolution providing for a preliminary peace treaty with Germany which should include, besides disarmament clauses, the approximate future frontiers of Germany, financial arrangements, post-war economic relations, and responsibility for breaches of the Laws of War. The various commissions which had been constituted to investigate these matters were directed to report not later than March 8 (one week before Wilson's expected return). This resolution received the cordial endorsement of the French and the Japanese. Baron Sonnino of Italy favored the principle though he was averse to having the German settlements made before Italian claims to Austrian territory were satisfied. Mr. Lansing and Colonel House of the American delegation, desirous of securing a speedy peace, acted against their absent chief's wishes and assented to the project. Lord Milner of the British delegation alone opposed the move, but in vain. The foes of the League secretly rejoiced at this victory, and it was openly declared that the League was shelved. On March 1, Marshal Foch presented a report on the military terms of the Treaty. No sooner, however, had the Council of Ten resolved to frame a general preliminary treaty of peace omitting the League than difficulties were encountered. All sorts of controversies began to crop out. The British and the French differed about the disposition of the German war vessels, the British and Japanese about former German cables. Lloyd George no sooner returned to Paris than he had a falling-

out with Clemenceau. To make matters worse, the Italians objected very vociferously to a quick peace with Germany which left Austrian problems in abeyance.

Such was the situation upon the return of President Wilson to Paris on March 14. In many respects his visit home had been discouraging, for he had learned that he could not count with certainty upon the American people's support of his peace programme. Circumstances demanding decisive action on his part, the very next day he issued a strong proclamation repudiating American support of the scheme for a preliminary comprehensive peace settlement without the League and announcing that the resolution adopted at the second plenary session on January 25 to the effect that the League should be made an integral part of the general treaty of peace, was of final force.

Reports of commissions—territorial and other—were now being received, but they had been prepared for the most part by subordinate members of the various delegations without supervision or direction on the part of the chief plenipotentiaries. The time was rapidly approaching when formal decisions had to be reached on questions on which it was known that grave differences existed among the various statesmen. Secrecy was deemed an essential condition for the arrangement of those compromises by which alone amity and unanimity could be preserved. Many complaints had arisen about the delay of making peace and the slow progress of the Conference seemed to necessitate a radical reorganization of the form and procedure of the Supreme Council. Under pressure of the British delegates it was decided about the third week of March to substitute a Council of the Heads of the Four Great Powers of France, Italy, the United States, and Great Britain for the larger and more unwieldy Council of Ten. Definite announcement of the change was made on March 25. Marquis Saionji, the head of the Japanese delegation might have claimed a seat in this conclave but abstained from so doing except when his nation's interests were specifically involved on the ground of his ignorance of European languages. The foreign ministers who had been members of the Council of Ten henceforth met separately as a subordinate Council of Five to which was intrusted decisions on matters of secondary importance, preliminary preparation of miscellaneous material for the consideration of the Supreme Council of Four and the execution of numerous administrative tasks which had formerly consumed the time and energy of the old Supreme Council of Ten.

From March 25 to May 7 the Four worked at high pressure to complete the German treaty. Meeting two or three times a day they decided questions of principle and high policy, consulting the experts on technical points and details of the subjects discussed. The intensified secrecy of their procedure reacted upon the press and public to produce considerable irritation and much confusion. Its sole justification was that it concentrated power in the hands of responsible statesmen and promised a more expeditious settlement.

**The French Demands.** The somewhat cool reception which Wilson had encountered at home did not pass unnoticed in Europe. Clemenceau and Lloyd George undoubtedly felt that Wilson's domestic support was so unstable that they who could point to the tangible popular mandates of

victorious elections and votes of confidence were justified in adopting a stronger tone. These three chief conferees now faced in all its acuteness the problem of finding some basis of unity among themselves upon which the terms of the peace settlement might rest. In January Wilson had insisted upon immediate steps toward the creation of a League of Nations. The French now resolved to carry through in its entirety their formidable programme of security, reparation, and expansion. It embraced the following points: (1) French military control of the Rhine; (2) a permanent alliance of the Great Powers to help France hold it; (3) erection of a group of smaller allies to menace Germany from the East; (4) territorial reduction of the German Empire; (5) crippling of the German political organization through the encouragement of separatist movements; (6) disarmament of Germany but not of the Allies; (7) a crushing indemnity to cover not merely restoration of northern France but as much of the French war debt as possible; (8) appropriation of German economic resources; (9) a set of commercial agreements preferential to France, prejudicial to Germany. In addition the French were determined to acquire a large share of the economic opportunities of developing parts of Turkey and the former German colonies.

Wilson recognized that his programme of permanent world peace based upon sound moral principles backed by mutual guarantees was seriously jeopardized by the French demands. He had upset many plans on March 15, by declaring that the League must be an integral part of the Treaty. He consistently opposed Marshal Foch's projects of sending military expeditions to coerce Soviet Russia, and on March 17, during the final consideration of the military, naval and air terms of the Treaty, caused the rejection of an elaborate scheme advanced by the French for perpetual control over the military and naval affairs of Germany. Shortly afterwards he was instrumental in again defeating, in the League of Nations Commission, the plan sponsored by M. Bourgeois to make the League practically a military alliance for the defense of France. In addition, while on his way back to France he had refused, by wireless, to consent to the French proposal to include the entire costs of the War in Germany's reparations bill. Such actions, though maintaining his position, served to irritate and consolidate the opposition.

The French determined not to yield on any more points. Though unanimously assured of the return of Alsace-Lorraine, political, military, and economic motives impelled them to demand a more complete "rectification" of their eastern frontier. The secret agreement of February, 1917, with Russia had assigned them, first, outright annexation of the entire iron district of Lorraine and the entire coal district of the Saar Valley, and, second, the separation from Germany of the remaining territories on the left bank of the Rhine and their erection into an autonomous neutral state to be occupied by French troops pending final fulfillment of all conditions of peace to be imposed upon the enemy. With minor modifications the execution of their agreement together with a proposal for an indefinitely extended inter-Allied control of the Rhine bridges was vigorously advocated by the French delegation at the Conference, and the debate on this subject of fundamental importance was keen and protracted,

lasting off and on for the first six months of 1919. On March 14, Wilson and Lloyd George offered to pledge their respective countries to aid the French in case of an unprovoked attack by Germany. Clemenceau accepted this extraordinary guarantee with much gratitude, but insisted that it supplement rather than supersede the French plan for indefinite occupation of the Left Bank and military control of the Rhine. On March 27, the French finally presented their definitive claim to the Saar, pared down to an irreducible minimum providing first for political annexation of that part of the Saar basin which had belonged to France under the frontier of 1814 but had been relinquished to Prussia as an additional penalty after Napoleon's débâcle at Waterloo, and, second, for full French ownership of the mines in the adjoining regions. The whole controversy on this issue, together with disputes about reparation, amendments to the covenant of the League of Nations, and other points, came to a head late in March. From March 25 to April 7, the Conference seemed to have reached a standstill as the major plenipotentiaries battled for supremacy. Affairs had reached an impasse.

Working in supposedly strict secrecy, the Council of Four struggled frantically to discover some working arrangement. American experts had recommended granting a portion of the Saar region to France as compensation for the wanton destruction by the Germans of mines in northeastern France. Wilson readily acknowledged the validity of French claims to coal from the Saar, and was early convinced that transfer of the mines was the surest method of just compensation, but could not be brought to consent to French annexation of any part of the Saar or to political separation of the Left Bank from Germany. The British, though sympathetic with French desire for security, unrelentingly opposed a separate buffer state on the Rhine. As regards the Saar they favored the transfer of the mines but instead of direct annexation preferred the creation of a larger autonomous state under French protection. To the anger of the French, Lloyd George, in a memorandum circulated on March 25, protested that the Treaty as it was being framed could only operate to cause new and more terrible wars in the future and made a strong plea for moderation and justice in territorial readjustments. Clemenceau in a biting and sarcastic reply complained that all of Lloyd George's proposed concessions were in military and European matters at the expense of French security, not in naval or colonial matters at the expense of British security or aggrandizement.

The opening days of April have truly merited the caption "the Peace Conference's blackest hour." In the Council of Four, Clemenceau was at loggerheads with Wilson and Lloyd George and threatened to resign unless his demands were granted. His fall would probably have resulted in an even more obstinate French resistance. In the sessions of the League of Nations Commission the French were insisting on the adoption of amendments favoring militarization of the League and the maintenance of French security. There were grave premonitory rumblings of future disputes with the Italians and Japanese over their respective territorial claims. The inspired French press and certain sections of the English and Italian press uniting in a vituperative attack upon Wilson and to some extent upon

Lloyd George, anathematized the former as a pro-German and the sole obstacle to a speedy and satisfactory peace. On April 3, the President succumbed to physical exhaustion and for four days was confined to his bed. On April 4, came news of renewed disorders and aggressive Bolshevik projects in Hungary; on the same day King Albert of Belgium arrived to insist upon Belgian priority in reparations payments. On April 5, it was learned that Bavaria had embraced Bolshevism and on the sixth there were socialist demonstrations in the streets of Paris.

Wilson determined to force a showdown. His first action upon leaving his sick-bed was to order the *George Washington* to sail for Brest immediately. This was his ultimatum: either the French had to recede from their extreme demands or he would leave the Conference. The result was an era of compromise. Working under the necessity of preserving Allied solidarity and preventing a disruption of the Conference, Wilson and Clemenceau gradually fought out the problems of French security and reparation. On April 10, a solution of the Saar Basin (q.v.) question was attained. The mines were to be given outright to the French, but politically the region was to be administered for 15 years by a special League of Nations Commission after which a plebiscite was to determine its future status. On April 16, Wilson and Lloyd George agreed to a 15-year occupation of the Left Bank of the Rhine, together with Allied control of the three principal bridge-heads, the demilitarization of all this territory and also of a zone stretching 50 kilometers east of the river. Simultaneously it was definitely decided to sign the three-power defensive alliance as an additional guarantee of French security, though in so doing, Wilson laid himself open to serious charges of inconsistency as he had hitherto opposed special alliances within the general family of the League of Nations. Meanwhile in the final sessions of the League Commission, April 10 and 11, Wilson carried through certain American amendments that he considered necessary to meet domestic opposition but with Clemenceau's consent the proposed French amendments were rejected. On April 12, a compromise was reached on the reparations issue (see REPARATIONS). These decisions in regard to reparations, the Saar Valley, and the Left Bank of the Rhine completed the main outlines of the settlement with France. Though the worst period of the crisis was thereby weathered the compromises on these vital issues satisfied no nation and extraordinary attempts were subsequently made to evade or modify them, for the French never stopped fighting for their full programme, and the British and the Americans, regretting their concessions, endeavored to secure a reconsideration. However, by April 14, sufficiently comprehensive agreements had been reached by Wilson, Clemenceau, and Lloyd George to justify summoning the German delegation to Versailles. But three weeks were yet to elapse before the tentative draft treaty was completed and submitted to the enemy plenipotentiaries, for barely had the worst period of the French crisis been safely weathered when another storm—the Italian crisis—burst upon the Conference.

**The Italian Demands.** The Italians had been growing restive under the apprehension that the German terms would be settled before they had a chance to bargain for concessions in

the Adriatic, Asia Minor and elsewhere as the price of their approval of the settlement. Italian claims for territory were based primarily upon the secret treaty of London of April, 1915, by which Italy was promised the southern part of Austrian Tirol, up to Brenner Pass and including the Bozen district with some 200,000 Austro-Germans in addition to the ethnographically Italian region of Trentino; also Trieste; Gorizia, Gradisca, and Istria, a majority of whose inhabitants were Slavic; part of Dalmatia with all the best harbors except Fiume on the eastern side of the Adriatic; the town and district of Valona in Albania; the Dodecanese Islands in the Eastern Mediterranean, wholly inhabited by Greeks; imperialistic compensation in Africa and Asia Minor; and "a share of the war-indemnity." Subsequent secret arrangements, notably that of St. Jean de Maurienne in April, 1917, had elaborated prospective Italian gains in the Turkish Empire. The Treaty of London, as its terms gradually became known, had a poisoning and disillusioning effect all through the Balkans, and proved to be one of the chief obstacles to a speedy and satisfactory settlement at Paris. "More actual time was devoted by the Council of Four and other councils and commissions to the controversies which raged around this treaty than to any other single subject discussed." In a session of the Supreme War Council on Nov. 4, 1918, at the time of the armistice negotiations, Premier Orlando had made a reservation on Point Nine of Wilson's Fourteen regarding the readjustment of Italian frontiers "along clearly recognizable lines of nationality," but this was not incorporated in the note to Germany on November 5, on the ground that it concerned the peace with Austria-Hungary, not with Germany. The Italians not only refused to abide by the Fourteen Points, but went a step beyond the Treaty of London and claimed in addition the Port of Fiume, the annexation of which they had expressly, though it appears unwillingly, renounced in 1915. At that time it was agreed to offer Fiume to Croatia, Serbia, and Montenegro as compensation for certain sacrifices of Serbian territory to be utilized in enticing Bulgaria into the War on the side of the Allies. The latter project falling through, Italy revived her claim to Fiume in order to secure undisputed economic domination of the Adriatic and to prevent any potential rivalry on the part of Jugo-Slavia.

The attitudes of the Big Three toward Italian aspirations were very divergent. Sympathizing with the Jugo-Slavs, Wilson desperately endeavored to attain settlements not only just in themselves but based upon a broad and generous programme of coöperation. Clemenceau and Lloyd George, entangled in the commitments of the secret treaties, tended to recognize the obligations they had thereby incurred though opposing undue greediness on Italy's part. The scholarly and impulsive Orlando and the grim-faced Sonnino, so dissimilar in temperament and training, lacked sufficient unity of purpose and method to secure any substantial diplomatic victory. Hitherto somewhat in abeyance, the Italian claims were taken up in real earnest about the middle of April. Experts of the various delegations prepared reports and recommendations. Wilson intimated to Orlando that he would accept the northern frontier assigned by the Treaty of London and also Italian annexation of Lissa and Valona, but demanded that

as the natural outlet for the trade of Jugo-Slavia and Austria, Fiume should be made a free city within the Jugo-Slav customs area. Advocating the assignment of Dalmatia to Jugo-Slavia under guarantees protecting the rights of Italian minorities therein, he rejected a proposal subsequently made by Clemenceau and Lloyd George to award Fiume to Italy if she renounced treaty claims upon Dalmatia. From April 19 to 23, stormy discussions raged upon various phases of the problem. On April 20, Wilson read a memorandum setting forth his views which he proposed to publish if the Italians rejected all compromise. The British and French premiers approved the memorandum and Wilson evidently understood both of them to favor publication. On April 23, Orlando having refused to participate in any further deliberations until the question was settled in Italy's favor, Wilson caused a tremendous sensation throughout the world by publishing an appeal to the Italian people over the heads of their duly authorized representatives. The outraged Orlando threatened to go home and lay the matter before Parliament. To his surprise Wilson eagerly supported the proposal and to save their faces the Italians had to go, receiving cold comfort from Lloyd George and Clemenceau who informed Orlando in a secret memorandum that although against their better judgment they would stand by the Treaty of London they could not admit the justice of the Italian claim in Fiume. This second memorandum, if published, would have completely isolated the Italians, but due to Lloyd George's temporizing it was suppressed, and Italian public opinion skillfully manipulated to confuse the issues and injure Wilson. In the Supreme Council, Lloyd George pressed for compromise and concessions, bringing up the broad subject of spheres of influence in Turkey. But other problems required attention; it was necessary to go on with the work in hand. Though receiving a vote of confidence in his parliament on April 30, the Italian premier, recognizing the futility of further abstention from the proceedings, left Rome for Paris on May 5. The Adriatic question was still undecided. For its ultimate settlement, see FIUME-ADRIATIC CONTROVERSY.

**The Japanese Demands.** Contemporaneously with the Italian crisis over Fiume, there had taken place a sharp encounter with the Japanese over Shantung. The Mikado's representatives had hitherto confined themselves largely to silent observation of the wranglings of other nations and to a protracted though fruitless effort to secure insertion in the League of Nations Covenant of the principles of racial equality. Smarting under their defeat on this issue, the Japanese began strenuously to urge their claims to imperialistic aggrandizement in the Far East. Their diplomatic position was well-nigh impregnable. A secret agreement with Great Britain of February, 1917, subsequently approved by France, Russia, and Italy, assured Japan of the acquisition of Germany's rights in Shantung, and island possessions in the North Pacific, those south of the Equator being assigned to the British. Several secret agreements negotiated with China at the point of the bayonet in 1915 and September, 1918, had secured reluctant Chinese assent to the Japanese plan for eventual restoration of Shantung to China only upon conditions favoring the enhancement of Japanese interests in Shantung and Manchuria. The

Chinese having consented to these arrangements only under duress (see CHINA, *History*, and JAPAN, *History*) now asked the complete abrogation of all these old treaties and the direct restoration of Shantung without the intermediation or interference of the Japanese. The Japanese, bitterly denouncing Chinese participation in the discussion of their claims, and grimly resolved to stand their ground, demanded the absolute surrender to themselves of the former German "rights, privileges and concessions" in Shantung, after which they were to be left free to carry out the provisions of the treaty of 1915 and the arrangements of 1918. They summarily rejected a proposal made by Secretary Lansing in the Council of Foreign Ministers on April 15, and strongly supported by President Wilson in the Council of Four, providing for the blanket cession of all German rights in China to the Allied and Associated Powers for subsequent disposition. Lloyd George adduced the secret treaty of 1917 in justifying the Japanese claims, but his loosely made suggestion for a League of Nations mandate for Shantung was rebuffed by them. The Japanese peremptorily demanded an immediate and definite settlement of the problem in accordance with their stipulations since otherwise they had strict orders from home not to sign the treaty. The departure of the Italians redoubled the gravity and effectiveness of their threat to leave the Conference. The Belgians were simultaneously manifesting discontent over the reparations settlement and a complete break-up again seemed imminent. Against the strong advice of his advisers and fellow-plenipotentiaries, including Secretary Lansing and General Bliss, Wilson finally decided to yield to the practical considerations of the moment and on April 30, it was agreed that Shantung should be ceded to Japan in the actual Treaty, but that Japan in a supplementary verbal agreement was specifically to reaffirm her promise to return it to China under more explicitly defined conditions. This compromise solution saved the day, but was satisfactory to no one except the Japanese. It embittered the Chinese and led to their refusal to sign the treaty. It disheartened Wilson more than any other decision at the Conference. It stirred up great criticism in America and furnished a formidable weapon of opposition to the Treaty there. Not until the time of the Washington Conference was an amelioration of the settlement made which mollified the United States and China. (See SHANTUNG and WASHINGTON CONFERENCE.)

**The Polish Demands.** On the contentious issues of Fiume and Shantung, Wilson received scant support from his colleagues in the Council of Four, but when it came to the extravagant Polish demands supported by the French, Lloyd George entered the diplomatic lists in the guise of an embattled advocate of justice and moderation. In 1917 France in her secret arrangements with Russia had agreed to allow the Czar's government a free hand in drawing Germany's western boundaries, i.e. in annexing Prussian and Austrian Poland. But the advent of revolution in Russia and the subsequent régime of the Bolsheviks profoundly altered French policy. Having lost their powerful ally in the East and being interested in the creation of a ring of buffer states around Germany, the French argued for a great and strong Poland, which would not only hem in the Germans on the East but

also form a link in the *cordon sanitaire* to be forged around Bolshevik Russia. The British, while committed to the restoration of Polish statehood, refused to countenance the projects of aggrandizement advanced by the Poles and the French, as they served no direct British interest and promised to cause unrest and possibly war in Eastern Europe. The Territorial Commission appointed to consider the problem of Poland recommended the cession to her of almost the whole of the Provinces of Posen and West Prussia which had anciently constituted parts of the Kingdom of Poland, together with the district of Marienwerder controlling the railroad from Danzig to Warsaw. Poland was also to get the greater part of Upper Silesia, which had not been Polish for centuries. Mr. Lloyd George strongly opposed the transfer of 2,000,000 Germans to Polish rule and, supported by President Wilson, he secured a decision allowing a plebiscite in Marienwerder, and making Danzig a free city under the League of Nations though subject to Poland in customs regulations and conduct of foreign relations.

The essential terms of the treaty were now complete. On April 28, at the fifth plenary session, the League of Nations Covenant and the International Labor Charter were adopted by the Conference, and on May 6, despite a strong undercurrent of dissatisfaction among the smaller powers "with special interests" who felt that their views had not been sufficiently considered, a summary digest of the whole treaty was read and approved.

**German Reception of the Treaty.** Headed by Count Brockdorff-Rantzau, foreign secretary of the republican government at Berlin, the German plenipotentiaries arrived at Versailles on April 29. Here, on May 7, the Preliminary Conference was transformed into a definitive Peace Congress and at a ceremonial meeting the proposed treaty was formally transmitted to the German delegation by Clemenceau whose tart speech declaring that the war had cost the victors too much to allow the remission of any precautions or guarantees necessary to ensure a lasting peace, elicited from Brockdorff-Rantzau an extremely defiant and tactless reply marked by bitter denunciation of the Allies and a vigorous denial that Germany was solely responsible for the war.

Seven weeks of uncertainty ensued, taken up with the analysis of German protests, the formulation of the Austrian peace treaty (see below), and the last great crisis that preceded the signature. Oral discussion being barred, the Germans, commencing May 10, submitted an extended series of notes criticizing various parts of the Treaty, and on May 29 advanced an elaborate set of counter-proposals. Complaining that the principles of the Armistice under which Germany had laid down her arms had been violated in letter and spirit, they asserted that the terms imposed upon their now thoroughly democratic government were intolerably severe. They demanded a plebiscite to determine the future status of Alsace-Lorraine, and suggested that instead of ceding West Prussia, Danzig, and Memel they should be allowed to make Danzig, Königsberg, and Memel free ports under German sovereignty. They offered fixed annual supplies of coal to France in lieu of the Saar mines and argued that the retention of Upper Silesia was absolutely necessary if Germany were to fulfill her obligations. They requested

that Germany be admitted to the League of Nations immediately without conditions, and proposed that she retain her colonies under a League mandate. They advocated general instead of unilateral disarmament and asked the Allies to abolish compulsory military service in two years.

These and numerous other suggested changes and interpretations were considered by the Allied Councils and 13 special committees. Of great significance was an eleventh-hour attempt on the part of Lloyd George to secure modification of the terms of peace. Publication of a digest of the treaty had elicited vociferous denunciation of its provisions in liberal and labor circles in Great Britain and to some extent in the United States. Certain plenipotentiaries and experts in the British and American delegations at Paris were emphatic in their criticisms. Mr. John Maynard Keynes, a financial adviser on the British staff, resigned in protest, as did likewise Mr. William C. Bullitt of the American commission. In Germany all parties denounced the treaty and huge demonstrations of protest led to increasing anxiety about its possible rejection. Alarmed by the spread of dissatisfaction and fearful lest the Germans would refuse to sign, the consummate politician, Lloyd George, who on May 9 had been stronger than any of the others for coercion, swung suddenly toward the other extreme and began to demand somewhat radical revisions of the Treaty. He particularly attacked the provisions regarding the army of occupation and the Silesian settlement. Clemenceau criticized in France for having already yielded too much, convinced as always that the Germans understood nothing but force, and believing that once a few concessions were made they would insolently demand more, bristled with opposition and refused to agree to a reconsideration. Lloyd George turned to the Americans for support. Wilson having struggled all through the Conference to abate excessive British, French, Italian, Japanese, and Polish demands, was not impressed by the British premier's periodic conversions to wisdom and sanity. On June 1, Lloyd George consulted his cabinet at a special meeting convened in Paris, and the very next day he threatened to go home and lay the whole matter before Parliament if Clemenceau did not consent to changes. The French premier, himself facing a ministerial crisis, declined to budge. Wilson, at a special meeting of the American delegation on June 3, announced that he was strongly in favor of making any changes that would ensure more complete justice, but he opposed granting any last minute concessions merely to placate the enemy. He feared that the resumption of conversation about French security and other points would imperil the whole delicate structure of the settlement. With the President's consent the American experts did urge that a definite and moderate sum of reparation be fixed; but Lloyd George, remembering his election pledge about recovering the costs of the war—some \$120,000,000,000—frankly opposed the move. On June 16, however, he secured a convention providing for supreme civil rather than military control of the occupied territory and a declaration limiting the cost of the Army of Occupation to be assessed upon the enemy. The Allied reply to the German observations on the conditions of the Peace which was dispatched on the same day, registered certain additional modifications

including the requirement of a plebiscite for Upper Silesia, a slight readjustment of Poland's western frontier, a retardation of the required reduction of the German army, and a provision for the collaboration of a German commission in discussing methods of reparation payments. Despite these concessions the Allied reply was in effect an ultimatum calling for Germany's acceptance or refusal on or before June 23.

The return of the German delegates from Versailles with the modified treaty conditions precipitated a ministerial crisis at Berlin. The Scheidemann government which had fomented resistance to the treaty, and threatened not to accept it, resigned on June 21, and was replaced by a transitional ministry under Adolph Bauer pledged to acceptance of the treaty. An effort to secure the omission of the articles requiring the confession of war guilt and the surrender of war criminals met with an absolute refusal by the Supreme Council to consider any further modifications and a demand for immediate compliance. Marshal Foch was ordered to advance on Berlin with the Allied armies should the German government not submit within the time limit, and preparations were made for tightening the blockade. The Germans reluctantly gave way. On June 23, the National Assembly at Weimar voted 237 to 138 to accept the treaty unconditionally and the next day the Allied Supreme Council was informed of the fact. Dr. Hermann Muller, the new foreign secretary, and Dr. Johannes Bell, colonial secretary, were prevailed upon to act as plenipotentiaries in place of Brockdorff-Rantzau and his colleagues. On June 28, 1919, five years to a day after the assassination of the Austrian Archduke Francis Ferdinand, the two representatives of the new German Republic attached their signatures to the Treaty of Versailles which, being signed by the delegates of all the Allied nations except China, officially terminated the Great War.

**Attacks on the Treaty.** The Treaty of Versailles met with a mixed reception in all quarters of the world. It was no peace of reconciliation—in some respects it was a peace of vengeance, for the legacy of hatred left by the war had proved exceedingly potent. There were liberals and radicals everywhere who vehemently assailed the Treaty as an "iniquitous document," a surrender to the forces of reaction, "a crime against civilization"; there were nationalists, and imperialists and militarists in every country who scored the leniency of the terms and denounced their respective plenipotentiaries for sacrificing legitimate national interests in return for vague assurances of international co-operation. Many Frenchmen were incensed because their demands for a Rhine frontier had been negated; certain Belgians complained about the failure of the Conference to arrange to have Holland cede them the left bank of the Scheldt; the great mass of Italians were embittered by the defeat of some of their more extreme projects of aggrandizement in the Adriatic; the Chinese, as we have seen, refused to sign the Treaty because of the unjust Shantung settlement. General Smuts of South Africa, while attaching his signature, openly protested in Wilsonian phraseology against the severity of the terms. Mr. Wilson himself, who had struggled so sincerely for a settlement of a different type, now became an ardent defender of the Treaty, being convinced that it was the

best obtainable under the circumstances. The Treaty was perforce promptly sanctioned by the German National Assembly, which ratified it on July 7. Most of the other nations accepted it at intervals throughout the year, and on Jan. 10, 1920, an exchange of ratifications between the Allies and Germany was effected at Paris. But among the Great Powers the United States conspicuously abstained from ratifying the treaties and eventually made a separate peace settlement with Germany. (See UNITED STATES, *History*.) Thus the three-power defensive pact with France and Great Britain for the maintenance of French security which was signed at the same time as the Versailles Treaty lapsed, for although the Anglo-French treaty had been ratified by the British it was not to come into effect until the ratification of its Franco-American counterpart.

#### THE TREATY OF VERSAILLES

The Treaty of Versailles, as signed on June 28, 1919, revolutionized the international status of Germany, territorially, politically, militarily and economically. By its terms Germany lost her navy, her merchant marine, her colonial empire, invaluable natural resources; and her army was reduced to impotence. The first 26 articles of the Treaty constituted the Covenant of the League of Nations, but from this Germany was to be temporarily excluded. (See LEAGUE OF NATIONS.) The rest of the large-sized volume of 440 articles and annexes set forth more specific conditions of peace.

**Political Terms.** Germany recognized the complete independence and unconditional sovereignty of Belgium, Poland, Czecho-Slovakia, and German Austria, denounced the treaties of Brest-Litovsk and Bucharest, and agreed to allow the Allies *carte blanche* in dealing with Russia, Turkey, Bulgaria, Hungary, and Austria.

**Territorial Terms.** Germany lost all of her overseas possessions and some 27,500 square miles, or a trifle over 13 per cent of her European domain. Alsace-Lorraine (q.v.) was returned to France, and the Saar Basin (q.v.) placed under a League of Nations Commission for 15 years as described above. Belgium received the small districts of Eupen (q.v.), Malmédy, and Moresnet. Under plebiscites held in February and March, 1920, to determine the status of Northern and Central Schleswig (q.v.), the former, comprising some 1537 square miles, was reunited with Denmark, but the latter remained with Germany. To Poland were ceded large parts of the provinces of Posen and West Prussia. In July, 1920, plebiscites in southern East Prussia and the Marienwerder (q.v.) district of West Prussia produced very substantial majorities for Germany. The plebiscite in Upper Silesia (q.v.) in March, 1921, gave a majority for Germany, but to the disappointment of the Germans, in October, 1921 the Council of the League of Nations, having been invited to settle the controversy, awarded the richest part of the region, some 12,55 square miles, to Poland. A small portion, 110 square miles, of Upper Silesia was ceded to Czecho-Slovakia on July 28, 1920. The port of Memel (q.v.) with adjacent territory was ceded to the Allies for ultimate transfer to Lithuania. The port of Danzig was likewise ceded to the Principal Allied and Associated Powers, who in

accordance with the agreement described above recognized Danzig as a free city administered under the League of Nations but subject to Polish jurisdiction as regards customs and foreign relations. Germany renounced all special rights and privileges in China, Egypt, Siam, Siberia, Morocco and Turkey. Her rights and privileges in Shantung were ceded to Japan. (See WASHINGTON CONFERENCE for eventual Japanese settlement with China.) Germany ceded to the Principal Powers all of her remaining overseas possessions which in accordance with Article 22 of the League of Nations Covenant were to be administered by the mandatories of the League. Already on May 6, 1919, the Supreme Council had made a provisional distribution of mandates. Great Britain was to receive German East Africa. On May 30, however, the British government resigned to Belgium the districts of Urundi and Ruanda contiguous to Belgian Congo to be administered under separate mandate. German Southwest Africa went to the British dominion of South Africa. France and Great Britain were to receive a joint mandate over Cameroon and Togoland with permission to partition them by mutual agreement. German New Guinea was assigned to Australia, German Samoa to New Zealand, the island of Nauru to Great Britain, and the German islands north of the Equator to Japan. On Feb. 21, 1921, President Wilson announced that the United States could not agree to have the cable centre on the island of Yap (q.v.) assigned to Japanese control and a new arrangement in regard to it was made at the time of the Washington Conference. (For account of the mandatory system see MANDATES and also LEAGUE OF NATIONS.)

**Military Terms.** Germany was required to abolish compulsory universal service; to reduce her army to 96,000 men and 4000 officers recruited by voluntary enlistment; to demilitarize all the territory on the Left Bank of the Rhine and also that on the right bank to a depth of 150 kilometers; to stop all importation, exportation, and nearly all production of war material; to limit her navy to six battleships, six light cruisers, and 12 torpedo boats, with no submarines, the naval personnel not to exceed 15,000 officers and men; and to abandon all military and naval aviation by Oct. 1, 1919. The execution of most of these provisions was to be supervised by an inter-Allied Commission of Control endowed with full powers of inspection and investigation. (See below, *Continuation Conferences*.) In addition, she agreed to demilitarize the island of Helgoland, to open the Kiel Canal to all nations, to surrender her 14 submarine cables, and, last but not least, to permit the trial of her ex-Emperor by an international high court on the charge of "a supreme offense against international morality," and of other officials for violation of the laws and customs of war.

**Economic Terms.** The economic and reparation provisions of the Treaty were exceedingly drastic and constituted a perplexing problem which more than any other aspect of the Treaty of Versailles has subsequently disturbed the peace of the world. (See REPARATIONS.) In addition to paying heavy indemnities the Germans were required to grant nonreciprocal most-favored-nation treatment to the commerce of Allied nations for a period of years. As guarantees for the payment of reparations the

Allies were to maintain military occupation of the Left Bank of the Rhine and of the bridgeheads at Cologne, Coblenz and Mainz, with provisions for the evacuation of the latter three districts at five year intervals should Germany be duly fulfilling her obligations. Including the Saar Basin (742 square miles) a total area of 12,338 square miles was to be occupied by the Allies and the subsequent seizure of the Ruhr by the French in 1923 added nearly a thousand more.

#### THE AUSTRIAN TREATY OF ST. GERMAIN

With the signing of the Treaty of Versailles with Germany on June 28 the major task of the Peace Conference was concluded, and the most important plenipotentiaries except Premier Clemenceau departed from Paris leaving subordinate statesmen and diplomatists in charge. Mr. Lansing, succeeding Mr. Wilson as head of the American delegation, stayed until July, when he withdrew, leaving Mr. Polk, Under-Secretary of State, to act for him. Mr. Balfour became the chief of the British delegation, but in September he, too, departed, surrendering the headship to Sir Eyre Crowe. Premier Orlando's cabinet had fallen from power on June 19 as a result of Italian dissatisfaction over the Adriatic negotiations and his successor, Signor Nitti, refrained from visiting Paris.

**Claims of the Succession States.** Although giving priority to the settlement with Germany during the first six months of 1919, the Peace Conference had simultaneously taken under consideration the problem of arranging terms of peace with Austria, Hungary, Bulgaria, and Turkey. It was planned to have the five treaties form part of the same general settlement, each beginning with the League of Nations Covenant, and employing as far as possible the same form and phraseology. The second treaty to be drafted and signed was that with Austria. Italy was the only Great Power with vital interests at stake, although France was insistent on preventing the union of Austria with Germany and carried her point during the era of compromise following the French crisis in April. She also favored a confederation of satellite states on the Danube to act as a bulwark against Germany in the southeast. To the numerous other "heirs of the Habsburgs," however, Czecho-Slovakia, Poland, and the Balkan Allies, the disposition of Austrian territory was of supreme importance. As a result of the nationalistic revolution in the Dual Monarchy, the division had already taken place along broad lines by the time the Peace Conference met. But problems of frontiers still remained, some of which occasioned most violent conflicts. In Silesia, Poles and Czechs struggled for the control of the district of Teschen with its invaluable coal mines. (For discussion of this problem see TESCHEN.) In the Adriatic, Italians and Jugo-Slavs came to swords' points over Dalmatia. In the Klagenfurt Basin, Italians, Jugo-Slavs, and German Austrians were ready to come to blows. The conflicting claims and charges of the various litigants, each of which viewed affairs through the colored prism of its own nationalistic ambition, rendered extremely difficult the task which confronted the Supreme Council as regards Austria in the spring of 1919. Despairing of having the disputants arrive at amicable agreements among themselves, the Council of Ten constituted territorial commissions in February, 1919 to study the bound-

ary problems of the various states except Italy. By the time the reports of these commissions were ready the Council of Four had superseded the Ten and with few exceptions the unanimous recommendations of the commissions were approved without alteration. Over points in dispute the Four worked earnestly, paying little attention to the small states. President Wilson finally acknowledged Italy's claim to the Brenner frontier, involving though it did the expatriation of over 200,000 Germans. The approximate boundaries of Czecho-Slovakia and Jugo-Slavia were settled during May, the former being assigned regions of Bohemia inhabited by 3,000,000 Germans, the transfer being dictated by economic and strategic considerations.

Work was rushed on the Austrian treaty so that it might be in the hands of the Austrians before the treaty with Germany was signed, for each contained the provision prohibiting union of Austria with Germany, each was to contribute to the territorial resurrection of Poland, and last but not least, Italians were insistent upon a simultaneous settlement with the two countries. An incomplete draft of the treaty was presented to the seventh plenary session with the intention of communicating it to the Austrians on the following day but the plenipotentiaries of the Succession and Balkan States demanded time to study the document. Two days later at the eighth plenary session, Premier Bratiano of Rumania supported by the Polish, Czecho-Slovak and Jugo-Slav representatives protested against having the Great Powers prescribe regulations for the protection of minorities within their separate states. Mr. Wilson answered that the Principal Powers could not be expected to guarantee the independence and integrity of the new states unless the latter would on their side guarantee equality of rights to racial or religious minorities transferred to their control under the peace settlement. Rumania and Jugo-Slavia, though greatly enlarged by the new readjustments, were old states and denied the right of the Conference to limit their sovereignty by special restrictions. Mr. Venizelos of Greece suggested that a joint meeting of the Council of Four with the smaller Allies ought to be held to consider the legitimate anxieties of the latter. But all objections were overruled by Clemenceau, Lloyd George, and Wilson. The Austrian delegates had arrived at St. Germain near Paris on May 14, and on June 2, the preliminary draft of the treaty was transmitted to them. On July 20, the Supreme Council transmitted a more complete and revised draft of the treaty to the Austrians, informing them that Burgenland or German West Hungary for whose annexation they had asked would be ceded without a plebiscite. (See **BURGENLAND**.) The Austrians formulated and presented their observations on the revised terms on August 6, still protesting against the patent violations of the principle of self-determination. In their final reply of Sept. 2, 1919 the Allied and Associated Powers made few additional concessions—perhaps the most noteworthy being the return to Austria of the important railway junction of Radkersburg originally assigned to Jugo-Slavia. On September 8, the Austrian National Assembly authorized its delegates to sign the treaty, and this ceremony took place at St. Germain on September 10. But the opposition of Rumania and Jugo-Slavia to acceptance of Minorities Treaties to which they

would have pledged themselves by underwriting the Austrian treaty led them to refuse to sign, until some time later. Though the Austrian National Assembly had already perforce ratified the Treaty of St. Germain on October 17, ratifications were not exchanged until July, 1920.

**Political and Military Terms.** The Treaty of St. Germain required Austria to recognize the complete independence of Jugo-Slavia, Czecho-Slovakia, Poland and Hungary, to make liberal cessions of territory to various victorious neighbors including Italy, and to accept elaborate regulations for the protection of such racial, religious, or linguistic minorities as remained within her much-diminished territorial confines. As described above the cession of lands to Italy included not only *Italia Irredenta* but also for strategic reasons the Brenner Pass frontier in the Tirol with about 250,000 German inhabitants. One-fourth of the inhabitants of the new state of Czecho-Slovakia were Germans in Bohemia and Moravia, this violation of the principle of self-determination being motivated by economic and strategic considerations and justified on historical grounds. Eastern Galicia, inhabited by a Ruthenian majority with a strong Polish minority, had been bitterly contested between these two nationalities, and had been seized by the Poles during the Conference; it was renounced by Austria in favor of the Principal Allied and Associated Powers, who acquiesced in Poland's de facto possession of the region, without definitively settling the question of sovereignty. The Duchy of Bukovina, with 300,000 Ruthenian and 273,000 Rumanian inhabitants, was renounced by Austria in favor of Rumania. As a result of the Klagenfurt plebiscite of October, 1920, the whole of that much-contested area remained Austrian. An additional solace was the award of German West Hungary (Burgenland). Thus through revolution and dismemberment the state of Austria shrank from its pre-war expanse of 116,000 square miles to the diminutive area of 32,000 square miles. The Austrian army was reduced to 30,000 men recruited by long-term voluntary enlistments; military aeronautics were prohibited; all war vessels were surrendered and future maintenance of naval forces obviated through loss of maritime ports. Commercial clauses of general similarity to those in the Treaty of Versailles were imposed upon Austria. She was guaranteed free access to the Adriatic. A commission on which Great Britain, France, Italy, Rumania, and the riparian states were represented was established to regulate traffic on the Danube. All transferred territories were made responsible for their fair shares of the pre-war Austrian debt. Austria was obligated to pay such indemnities as might be prescribed by the International Reparation Commission, but so crippled was the new republic politically, industrially, and commercially that in a few years intervention by the League of Nations proved necessary to straighten out her finances (see LEAGUE OF NATIONS; AUSTRIA; REPARATIONS).

#### THE BULGARIAN TREATY OF NEUILLY

Following the settlement with Austria, the Supreme Council devoted more attention to the task of arranging peace with Bulgaria—the first of the Central Powers to lay down its arms at the end of the Great War. The protracted delay which intervened between the arrival of

the Bulgarian delegation on July 26 and the formal presentation of a preliminary draft of their treaty on Sept. 19, 1919, led to considerable exasperation on the part of their truculent leader, M. Theodoroff. Learning the substance of the treaty conditions from the press he lodged strenuous objections with the Supreme Council on September 2, denying that Bulgaria was the one "guilty, imperialistic and aggressive nation" in the Balkans and protesting against the violations of the principle of self-determination prefigured in the proposed dismemberment of Bulgaria. These objections to the territorial terms were reiterated in the formal observations submitted on October 24. The Bulgarians also complained about their exclusion from the League of Nations and demanded changes in the military provisions so as to permit the retention of conscription. The reply of the Supreme Council on November 3 promised speedy admission to the League but otherwise made no substantial concessions. Further remonstrances from the Bulgarians had no effect other than the issuance of an ultimatum on November 5 demanding acceptance or rejection in ten days. Meanwhile in Bulgaria a general election held in August had resulted adversely to the government and a new ministry recruited from the Agrarian party under the leadership of M. Stambulisky came into power in the midst of the agitation about the treaty. On November 13 the Bulgarians still protesting yielded to superior force. Premier Stambulisky declared that he had "no illusions" and would sign "even a bad peace." He was the sole signatory for Bulgaria when the Treaty was signed at Neuilly on November 27. Jugo-Slavia and Rumania were not permitted to sign until they had accepted the Minorities Treaties supplementary to the Austrian Treaty. Ratifications of the Treaty of Neuilly were exchanged on Aug. 9, 1920.

Many clauses of the treaty were identical with those of the Treaties of Versailles and St. Germain, notably the League of Nations Covenant, the Labor Convention, aeronautical provisions, penalties, etc. Politically, Bulgaria was required to recognize the independence of Jugo-Slavia, to renounce the benefits of the Treaties of Bucharest and Brest-Litovsk and to accept regulations for the protection of racial, national, religious, and linguistic minorities. Territorially, Bulgaria was deprived of most of her gains resulting from the Balkan Wars and all of her conquests made during the Great War. The Dobruja went to Rumania, as before 1914, leaving for future consideration the problem of inducing Rumania to relinquish such Bulgarian districts as it included. Thrace was ceded to the Principal Powers for ultimate assignment to Greece. Particularly embittering to Bulgaria was the loss of the small districts of Tsaribrod, Bosilegrad, Strumitsa, and Timok Valley—all predominantly Bulgarian but all transferred to Jugo-Slavia for strategic reasons. Jugo-Slavia had suffered grievously from Bulgarian attack and domination during the recent war, and in the bitterness of retaliation demanded other territorial annexations, but these were denied to her on ethnographic grounds. A small district of former Turkey was added to Bulgaria on the southeast. Bulgaria was obliged to abandon conscription, to reduce her army to 20,000 officers and men together with gendarmes and other police to a number not exceeding 13,000.

All war vessels except four torpedo boats and six motor boats were to be surrendered or destroyed, military aeronautics prohibited, and the manufacture of munitions strictly limited. In addition Bulgaria was to pay extensive reparations (two and a quarter billion gold francs in 37 years), supply live stock for devastated areas, and ship large allotments of coal to Jugo-Slavia annually for five years. Commercially, she agreed to give the Allied and Associated Powers most-favored-nation treatment and freedom of transit for goods and persons, receiving in return the guarantee of freedom of transit to the Ægean with which her territory was no longer contiguous.

#### THE HUNGARIAN TREATY OF TRIANON

The conclusion of peace with the Hungarian wing of the old Habsburg Dual Monarchy was a protracted and difficult task, complicated alike by perplexing boundary disputes among the victors and by political instability and intransigence upon the part of the vanquished. The democratic republican régime established in Hungary by the revolution of November, 1918, was supplanted in March, 1919, by a Bolshevik dictatorship on the Russian soviet model just at the most critical moment of the Paris Peace Conference. (See above.) The communist leader, Bela Kun, defied the Supreme Council during the crucial months of April, May, and June. However, due to the exigencies of diplomacy and the nationalistic ambitions of the Balkan Powers, early decisions were arrived at regarding the territorial dismemberment of Hungary. Great difficulty was encountered in reconciling and adjusting the divergent interests and conflicting claims of Jugo-Slavia and Rumania. The secret treaty of August, 1916, which purchased Rumania's entrance into the Great War proved a source of much bickering and bitterness. Premier Bratiano of Rumania asked for the complete fulfillment of treaty stipulations, but the Big Four, arguing that all previous commitments were cancelled by Rumania's signature of the Treaty of Bucharest in May, 1918, refused to accede to his demands. The Banat of Temesvar (q.v.) all of which had been assigned to Rumania by the Treaty of 1916, was now partitioned between her and Jugo-Slavia. Despite reiterated Rumanian claims and objections the terms of this settlement were definitely arranged in June, 1919. On June 13 the Supreme Council informed the Hungarians of the proposed cessions of territory to Rumania, Jugo-Slavia, and Czecho-Slovakia, and on July 20 as recounted above the rich district of Burgenland (German West Hungary) was promised to Austria. (For Hungarian political developments during this period, see HUNGARY.) On January 7 the Hungarian delegates, after the establishment of a home government satisfactory to the Supreme Council, arrived at Trianon, France, and here January 15 they were formally presented with a preliminary draft of their treaty the main terms of which had been ready as early as September, 1919.

**Council of Ambassadors.** One week later—on January 21—the Supreme Council convened for the last time and the Peace Conference of Paris was thus formally dissolved approximately one year after its sessions had begun. To the Council of Allied Ambassadors in Paris was intrusted the task of completing the settlements with the remaining enemy powers of Hungary

and Turkey though periodic conferences of the Allied premiers were shortly to be inaugurated for the purpose of dealing with other unliquidated problems of the peace. (See below: *Continuation Conferences.*)

On February 12, the Hungarians submitted a set of observations and counter-proposals which breathed a spirit of hostility and recalcitrance. They demanded the retention of the Czechlers (Magyars) of East Transylvania, and asked that no territories be transferred without plebiscites according to the inhabitants the right of self-determination. All transferred territories were to be retained in the Hungarian customs régime for a period of years, and better safeguards provided for the protection of Hungarian minorities. The Allies were in no mood to make concessions. The strong reactionary nationalist and monarchist sentiment rampant in Hungary elicited a joint statement from Great Britain, France, and Italy on February 12 to the effect that a Habsburg restoration would ipso facto violate one of the fundamental conditions of the peace settlement and call forth condign punishment. The new parliament elected early in 1920 designated Admiral von Horthy as "Protector of the Magyar Republic" but despite the emphatic pronouncement of the Allies the monarchial character of the constitution was reaffirmed on March 23. Hungary was a kingdom without a king. Such being the situation the requests of her delegates for more moderate treatment met with scant consideration. The reply of the Council of Ambassadors on May 6 contained but slight alterations though it was asseverated that the League of Nations would be free to make such minor modifications of boundaries on ethnological or economic grounds as the future might reveal as feasible or desirable. The treaty was formally signed at Trianon on June 4. Hungary ratified the treaty on Nov. 13, 1920 and was admitted to the League of Nations in September, 1922.

The Treaty of Trianon duplicated the main features of the Austrian treaty except as regards territorial adjustments. By its terms Hungary was transformed from a maritime, imperialistic country of 125,000 square miles into a landlocked fourth-rate power of some 35,000 square miles. On all sides liberal cessions were to be made to neighboring states. The region of Slovakia on the southern slope of Carpathian mountains, though containing a large minority of Magyars, was incorporated in the new state of Czecho-Slovakia for economic and strategic as well as ethnic reasons. To Rumania was assigned Transylvania with its compact Magyar minority in the East. A broad strip of Hungarian plain was also detached to secure Rumania's railroad communications with the Danube. Of the much contested Banat of Temesvar (q.v.) Jugo-Slavia received the county of Torontal in the west, the remainder going to Rumania. Jugo-Slavia also received Croatia-Slavonia, Bosnia and Herzegovina. Fiume (q.v.) was renounced, to be disputed by Italy and Jugo-Slavia. Likewise to Czecho-Slovakia, almost purely for strategic reasons, was given the region called sub-Carpathian Ruthenia, autonomy being stipulated for the benefit of the 572,000 inhabitants. To Austria was renounced the region of Burgenland (see above). Hungary was precluded from alienating her independence except with the consent of the League Council. Compulsory military service was abolished and her army was reduced to 35,000 men together

with police to a number not exceeding 31,500. She was required to pay a reasonable sum of reparations before May 1, 1921 and such total sums in sixty semi-annual installments thereafter as might be decided upon by the Reparations Commission. All of her merchant shipping and up to 20 per cent of her river fleet were to be surrendered; an indefinite quantity of live stock was to be furnished for devastated countries; and Jugo-Slavia was to be supplied with annual allotments of coal for five years. Deprived of two-thirds of her territory and population, crippled economically and surrounded by more or less hostile states, Hungary yet constituted a potent menace to the future peace of the Balkans. Three million Magyars, now aliens in adjacent countries, created a new irredentist problem so dangerous that in 1920 the Succession States of Czecho-Slovakia, Jugo-Slavia and Rumania formed the so-called "Little Entente" to meet it—an alliance calling for the indefinite maintenance of standing armies to guard against the restoration of the Habsburgs or Hungarian war of revenge. (See LITTLE ENTENTE.)

#### CONTINUATION CONFERENCES, 1919-1924

The Paris Peace Conference, as we have seen, adjourned on Jan 21, 1920, before the Hungarians had decided to accept their treaty and before the Adriatic question including the problem of Fiume and the disposition of Dalmatia, Albania, and Thrace had been settled. Even more important, no agreements had been reached upon three outstanding and vital issues, viz., the terms of the treaty with Turkey, the question of future relations with Soviet Russia and the fringe of states on her western border, and the enforcement of the treaties already signed or projected, especially the Treaty of Versailles with Germany, the task of executing which embraced a whole range of subjects such as reparations, disarmament, punishment of war-criminals, plebiscites, etc. These three major problems to say nothing of a host of subsidiary and secondary issues engaged the attention of the world continuously from 1919 to 1924 and necessitated a protracted series of difficult and delicate negotiations during which the appearance of Allied unity which had been so precariously maintained hitherto was even more seriously undermined. On Jan. 16, 1920, pursuant to the call of President Wilson the first session of the League of Nations Council convened in Paris, but though inextricably interwoven with the terms of the peace treaties and specially devised as a convenient and indispensable instrument of international coöperation and adjustment, the League was destined to play a relatively insignificant rôle in the controversies growing out of the territorial and economic settlement. (See LEAGUE OF NATIONS.) Rather the work of carrying on diplomatic arrangements at the termination of the Peace Conference devolved upon the two agencies already mentioned: the Council of Ambassadors and the Council of Allied Premiers and Foreign Ministers. These councils held a rapid succession of formal and informal conferences during the ensuing years, now dealing with Russia, now with the execution of the German Treaty, then again with Turkey, Fiume, or Upper Silesia. It was impossible to confine attention to any one problem until it was solved. Others simultaneously pressed for adjustment and the divergence of national interests led inevitably to the use of the traditional

and time-honored diplomatic methods of quid pro quo, compromise and compensation, interjected with accusations, threats, economic retaliation, ultimatums and armed clashes. The liquidation of two of these problems, i.e. the Turkish peace and the enforcement of the treaties, is discussed below. Under RUSSIA will be found an account of the handling of the Russian problem.

#### THE SETTLEMENT WITH TURKEY

**The Turkish Secret Treaties.** Of all the spoils of the Great War, the Ottoman Empire was among the richest. "Her undeveloped wealth in minerals and fuel; her potentialities as a producer of foodstuffs, cotton, and other agricultural products; her possibilities as a market—these were alluring as war-time necessities and peace-time assets. Her strategic position was of inestimable importance to any nation which hoped to establish colonial power in the eastern Mediterranean. Her future as a sphere of influence promised unusual opportunities for the investment of capital and the acquisition of exclusive economic rights." A long series of secret agreements were negotiated among the Allied Powers from 1915 to 1919 concerning the future political control and economic exploitation of Turkey. In March, 1915, Russia was assured of the annexation of the Straits and of Constantinople in return for assent to the assignment of the neutral zone of Persia to Great Britain and concessions to British interests in Mesopotamia and Egypt. On Apr. 26, 1915, by the Treaty of London, Italy was promised, among other things, a share in the Turkish Empire equal to that of Great Britain, France, and Russia, and including the port of Adalia and its hinterland. A more specific delimitation of interests took place in 1916. On April 26, one year after the Treaty of London, France and Russia signed the secret Sazonov-Paléologue Treaty dealing with their respective interests in northern Asiatic Turkey. Russia was awarded a vast domain of 60,000 square miles between the Persian frontier and the Black Sea, with immense deposits of silver, salt and copper. The French were assigned a large slice of territory reaching south and west to the Mediterranean, the exact boundaries to be arranged with the British. Two weeks later on May 9, the famous Sykes-Picot Treaty prospectively partitioned the southern part of Asiatic Turkey, allotting Syria, Cilicia and Southern Armenia to France in full sovereignty and establishing a French sphere of influence over the extensive and valuable provinces of Aleppo, Damascus, Deir, and Mosul. Great Britain was given complete control over the Mediterranean ports of Acre and Haifa and the region of lower Mesopotamia stretching from Bagdad to the Persian Gulf. Italy was excluded from these pacts, but learning of them in roundabout ways manifested such grave discontent that on Apr. 17, 1917, a new secret agreement, that of St. Jean de Maurienne, was signed. As subsequently modified in August, 1917, it provided that Italy was to get almost complete possession of the southern half of Anatolia, including the cities of Adalia, Konia, and Smyrna, together with an extensive sphere of influence in the region northeast of Smyrna inhabited chiefly by Greeks and Turks.

Curiously enough it was at this same time that the United States entered the war and that Allied statesmen were issuing fresh declarations

of unselfish war aims. To be sure the Russian Revolution and subsequent socialistic renunciation of all imperialistic ambitions combined with growing labor unrest to complicate the situation. In his address of Jan. 5, 1918, Mr. Lloyd George, speaking for the British government, disclaimed any intention of depriving Turkey of its capital, "or of the rich and renowned lands of Asia Minor and Thrace . . . predominantly Turkish in race," but did advocate a recognition of the separate national conditions of Arabia, Armenia, Mesopotamia, Syria, and Palestine. Three days later Mr. Wilson in his Fourteen Points speech stated that the Turkish portion of the Ottoman Empire "should be assured a secure sovereignty," but that submerged nationalities should be accorded "unmolested opportunity of autonomous development" and the Dardanelles should be permanently neutralized under international guarantees. This very definite pledge formed part of the pre-Armistice agreement which both Germany and the Principal Powers agreed to be morally binding for the Peace Settlement. Secret negotiations, however, continued to vitiate professed idealism. Lloyd George's speech in addition to reassuring British labor, mollifying Indian Moslems, and supporting Wilsonian internationalism served the ulterior but no less effective purpose of intimidating the French in secret dealings with regard to Turkey. In December, 1918, Clemenceau having visited London to secure confirmation of the Sykes-Picot arrangement of 1916, Lloyd George demanded the transfer of the valuable oil region of Mosul from the projected French sphere of influence to British control and also permission to determine the future of Palestine. Secret conversations continued unknown to "allied" Italians and "associated" Americans, and on February 15, a month after the Peace Conference began, the French were eventually obliged to accept the British proposal. On Mar. 20, 1919, just on the eve of the great French crisis described above, the finely spun network of secret treaties seriously entangled the Big Four in its meshes, when in secret session of that supreme conclave Lloyd George pressed for the dismemberment of Turkey. A heated controversy ensued between the British and the French. Wilson refused to acknowledge the validity of the secret engagements and proposed a settlement on the basis of his Twelfth Point. The matter was eventually compromised by the application of the mandate principle to transferred territories.

Other disputes arose continually. Early in February, 1919, the Italian claim to the Smyrna area having lapsed owing to the failure of Russia to sanction the St. Jean de Maurienne arrangement, the Greeks put in a claim to that region and also disputed Italian occupation of the Dodecanese. Italy sent expeditions to Smyrna and otherwise showed a disposition to anticipate decisions by the Conference. But when the Italians were absent from Paris in late April and early May, 1919, during the Fiume impasse, Venizelos pressed his claim and on May 6, unknown to the Italians, secured the secret authorization of the Big Three to occupy Smyrna. This move, being duly executed in the space of a fortnight, further embittered the Italians, and contributed to arousing Turkish nationalism with the dire consequences noted below. Lloyd George advanced numerous sordid schemes for solving the Fiume situation by granting Italy

concessions in Asia Minor and Africa but they all fell through. The collapse of Russia caused a long and acrimonious discussion of the future disposition of Constantinople and the Straits. France, Great Britain and Italy being seriously distrustful of one another, the United States was offered a mandate as early as February, 1919. Wilson favored the idea, but refused to pledge the American people. The subsequent course of events in America led to the abandonment of the project, caused great fluctuations in Allied policy and indefinitely delayed the signing of the Turkish Treaty. In November and December, 1919, while the Supreme Council was yet functioning, the Turkish settlement was discussed by representatives of Italy, France, and Great Britain in special conferences, and on Feb. 16, 1920 at a conference held in London, it was finally announced that Constantinople would be left under Turkish suzerainty. The work of drafting the treaty was then pushed.

The San Remo Conference. On April 24, at the Conference of San Remo the main outlines of the settlement were completed. Mandates for Syria, Cilicia, and Lebanon were promised to France; for Adalia and Rhodes to Italy; for Palestine and Mesopotamia (including Mosul) to Great Britain; and for Armenia offered first to the League of Nations and later to the United States, both refusing to accept. Simultaneously the French and British delegates at San Remo signed a secret agreement providing for an equal division of interests and exploitation in Rumania for the transfer of the formerly German owned quarter interest in Mesopotamia oil, together with a quarter interest in Anglo-Persian oil piped to the Mediterranean through territory under French mandate in return for the provision by France of pipe lines and branch railways for the movement of their oil. The terms of this agreement gradually transpired despite denials by the signatories, and on November 20, Secretary of State Colby (successor of Mr. Lansing) lodged a vigorous protest refusing to recognize the establishment of these oil monopolies in Mesopotamia and elsewhere. This merely stimulated the British to negotiate a new secret convention with France on Dec. 23, 1920, confirming the previous agreement. On May 11, the preliminary draft was handed to the Turkish delegates at Sèvres, France. Its terms produced great excitement among the Nationalists in Turkey, who, under the leadership of Mustapha Kemal Pasha, evinced a determination to defy the Allies and work for the regeneration of their country's fallen prestige and power. (See TURKEY.)

Boulogne and Spa Conferences. During May and June, the Nationalists, in control of Asiatic Turkey, drove the French to the coast of Cilicia and then threatened the Straits zone. So menacing did the situation become that on June 21, the Conference of Boulogne at which were represented France, Great Britain, Italy, Japan, Belgium, and Greece, authorized the Greeks to undertake military operations against the Nationalists. At the Conference of Spa Turkish requests for modifications in the peace conditions were rejected and an ultimatum was issued to coerce the Sultan's government, whose authority, due to the nationalist revolt, now scarcely extended beyond the confines of Constantinople, where it was both bolstered up and seriously limited by Allied occupation. On Aug. 10, 1920, the Treaty was signed at Sèvres, simul-

taneously with the signature of a secret tripartite agreement among Great Britain, France, and Italy and also of a special convention between Italy and Greece. Representatives of the United States and of Hedjaz were not present, and the Jugo-Slav delegates refused to sign.

**Treaty of Sèvres.** By the terms of this Sèvres Settlement of Aug. 10, 1920 the century-long devolution and dismemberment of the Ottoman Empire was virtually consummated. Territorially it was reduced from its 1914 area of 710,000 square miles to a small Turkish national state confined mainly to the interior of Asia Minor and embracing an area of less than 100,000 square miles. The Arab State of the Hedjaz was emancipated from Turkish sovereignty though subjected to British control. Armenia became a free Christian Republic, her boundary with Turkey to be arbitrated by President Wilson. Palestine, including Transjordan, under a League of Nations mandate held by Great Britain, was to afford a national homeland for the Jews. Syria, with Cilicia, was likewise detached from Turkey and made a mandate of France. Southern Anatolia, including the port of Adalia, was constituted as an Italian "sphere of influence," being a sorry remnant of the princely domain marked out for Italy by the St. Jean de Maurienne agreement. Smyrna and its hinterland were transferred to Greece together with Thrace, Adrianople, the peninsula of Gallipoli, and the islands of Tenedos and Imbros. By special arrangement with Italy the Dodecanese Islands in the Ægean which had been occupied by Italy since the end of the Tripolitan War in 1912, were to be yielded to Greece with the exception of Costellorizo and Rhodes whose status was to be determined by plebiscites. In the case of the latter the plebiscite was to be held only in case Great Britain, whose sovereignty over Cyprus was recognized by Turkey, ceded that Island to Greece. The French protectorates over Tunisia and Morocco were validated as were also those exercised by Great Britain over Egypt and the Sudan. The coasts of the Dardanelles, the Sea of Marmora, and the Bosphorus were erected into a neutralized "zone of the straits" controlled by a League of Nations commission consisting of British, French, Italian, Japanese, Rumanian, Greek, and Turkish members. The Capitulations which the Sultan had abrogated in 1914 were revived and amplified; Turkey was made responsible for the costs of the Allied military occupation, and her own army was to be reduced to a maximum size of 50,000 men. A Financial Commission was instituted to supervise taxation, customs, loans, and currency, to control the Turkish budget, and ratify or reject proposed economic concessions and all of this was to be done in the language of the tripartite agreement, "to help Turkey, to develop her resources, and to avoid the international rivalries which have obstructed these objects in the past."

**Rejection of the Sèvres Treaty.** Despite the acceptance of the Treaty of Sèvres by the Sultan's government at Constantinople, the divergent interests of the Great Powers created a serious lack of unity on the Near Eastern question which proved fatal when the Turkish National Assembly at Angora refused to ratify such an unjust convention. By October, 1920, through a series of successful military campaigns (see **TURKEY**) Mustapha Kemal Pasha

obliterated the Armenian Republic, rendered the French position in Cilicia untenable, forced the British army of occupation back into the Ismid peninsula, and compelled the Italians to withdraw their troops to Adalia. Menaced by an Arab rebellion in Syria, unable to protect Cilicia against the Nationalists, unwilling to increase the size of their Syrian military establishment which already numbered 100,000 men, dissatisfied with the distribution of spoils in the Near East, fearful of the augmenting power and prestige of British imperialism, the French decided to scrap the Treaty of Sèvres and come to terms with the Angora government of Mustapha Kemal Pasha. Having broached the project to the non-committal Lloyd George at the London Conference of February-March, 1921, they negotiated directly with the Angora delegation and on March 9, there was signed at London a Franco-Turkish agreement terminating hostilities in Cilicia. The Nationalists recognized the special social and cultural interests of France in Turkey, confirmed French interests in the Bagdad Railway and promised favorable concessions to French capitalists in Cilicia and southern Armenia. France on her part was to evacuate Cilicia, readjust the Turco-Syrian boundary, and adopt a more benevolent attitude toward the Grand National Assembly. (See **CILICIA**; **BAGDAD RAILWAY**.)

The Italian situation in Turkey was also very menacing for Italian troops had been driven out of Konia and maintained but an increasingly precarious position at Adalia. The Treaty of Sèvres was distinctly unpopular in Italy for it had registered a subversion of Italian prospects in Asia Minor to the advantage of the hated Greeks. Accordingly on March 13, a Turco-Italian agreement was signed at London providing for the withdrawal of Italian troops from Ottoman soil and for economic collaboration between Italy and Turkey in the Adalian hinterland, together with the granting of certain valuable concessions to Italian capitalists. The Italian Government also pledged itself to support effectively Turkish demands for untrammelled sovereignty and the restitution of Thrace and Smyrna. Their valiant resistance having elicited a sympathetic response from Bolshevik Russia, on Mar. 16, 1921, the Turkish nationalists achieved another diplomatic triumph when a treaty was signed at Moscow with the Russian Socialist Federated Soviet Republic. Russia refused to recognize the validity of the Treaty of Sèvres, disavowed all imperialist ambitions in Turkey, ceded outright the Caucasian territories of Kars and Ardahan, and declared the capitulatory régime null and void as being incompatible with the autonomous national development of Turkey.

Further negotiations conducted between France and Turkey during the summer of 1921 for the purpose of confirming and elaborating their March agreement culminated in the signing of the Treaty of Angora, on October 20. The British were outraged at what they termed this breach of good faith and stimulated the Greeks to renewed efforts against Turkey. The Franco-British Entente Cordiale was strained to the breaking point, not alone by antithetical policies in the Near East, but by acute differences simultaneously manifested over relations with Russia, naval disarmament, and German reparations. During the protracted and sanguine war between Greece and the Turkish Nationalists in

Asia Minor during 1921-1922, the British supported the Greeks as convenient tools for the advancement of their own interests, but the French and Italians aided and abetted the Turks even to the extent of withdrawing their troops from Constantinople. The decisive victories of Mustafa Kemal Pasha during the late summer and autumn of 1922 swept the Greeks out of Smyrna. An armistice between the Turks and the Allies was signed at Mudania, Oct. 10, 1922, permitting the former to retain Smyrna, take over the administration of Constantinople, and reoccupy Eastern Thrace, pending the formulation of a new peace treaty, to replace the thoroughly discarded Treaty of Sévres.

**Lausanne Conference.** A conference of the Turks and the European Powers was convened at Lausanne, Switzerland on Nov. 20, 1922 and was in session for eleven weeks, when it broke down, on Feb. 4, 1923, owing to the peremptory refusal of the Turkish delegation to accept a treaty drafted by the allied leaders. All hopes of destroying Turkish power by fostering Greek imperialism in Asia Minor had been dissipated, but Great Britain was determined to maintain control of Mesopotamia (particularly Mosul) and to secure continued neutralization of the Straits. The French supporting the Turks on these territorial questions, nevertheless aroused their suspicion and opposition by insisting on the maintenance of the Capitulations and the confirmation of all Allied concessions in Turkey. French prestige received a substantial setback with the granting (April 10) to American interests of the Chester concessions which authorized railroad construction and industrial developments throughout Eastern Asia Minor. The breach between France and Turkey grew wider with the lapse of time and when at Turkish suggestion and with Allied acquiescence the Conference of Lausanne was resumed on April 22, the French steadily lost ground, but, their power being almost wholly absorbed in the contemporaneous occupation of the Ruhr, they were unable to coerce the Turks into any measurable recognition of their claims. On May 15, it was disclosed that a syndicate of British interests had purchased a controlling interest in the Bagdad Railway.

**The Lausanne Treaty.** On July 24, 1923, the treaty was finally signed at Lausanne by representatives of Great Britain, France, Italy, Japan, Greece, Rumania and Turkey which constituted a drastic revision of the whole Near Eastern Settlement as registered in the Treaty of Sévres. Jugo-Slavia alone refused to sign because of dissatisfaction with the Ottoman debt settlement. Turkey definitely resigned all claims to Hedjaz, Palestine, Transjordan, Mesopotamia and Syria, but she retained all of Anatolia, Turkish Armenia, Cilicia, Adalia, Smyrna, Constantinople, Gallipoli, Adrianople and Eastern Thrace to the Maritza River. Along the new European frontier a neutral or demilitarized zone 60 kilometers wide was created, to prevent border conflicts. Likewise, but for a different purpose, the Gallipoli peninsula and the shores of the Straits were demilitarized and the Straits themselves were placed under an international commission supervised by the League of Nations. The "freedom of the Straits," for which the British foreign minister, Lord Curzon, had so valorously battled, was assured by a separate convention, bearing

all the earmarks of compromise, by which merchant and war vessels, the latter in restricted number, were permitted liberty of passage in peace and war, except in case Turkey should be one of the belligerent powers. Disposition of the coveted oil fields of Mosul, in dispute between Britain and Turkey, was to be decided by diplomatic agreement, or, that failing, by reference to the League. Not only were the fettering restrictions which the Allies had attempted to place on Turkish finance, army, and navy, struck off, but reparation claims were canceled and the Allies recognized the abolition of the Capitulations, stipulating merely that Turkey should appoint for a transitional period of five years four legal councilors, from neutral states, to observe the working of the Turkish courts. The Nationalists, in short, won a remarkable diplomatic victory in their single-handed diplomatic combat with the powers of Europe. The erstwhile aggressive Greeks were thoroughly humiliated. Not only were they compelled to surrender Smyrna, Gallipoli, and Eastern Thrace to Turkey, but also to resign again to Italy the Greek-speaking Dodecanese islands in the Ægean. Some 600,000 Greek nationals were to be deported from Turkish territory in exchange for Turkish nationals.

As the United States had not participated in the Lausanne Conferences except through an "observer" (Mr. Grew), it was necessary to negotiate a separate treaty between Turkey and the United States, recording the consent of the latter to the abrogation of the Capitulations and other changes made by the treaty above described. Accordingly, on August 2 Turkish and American delegates at Lausanne signed a treaty of commerce and amity. Ratification by the Senate being delayed, this treaty was subjected to the buffets of political controversy in the United States, and its ultimate acceptance was far from certain in August, 1924.

#### ENFORCEMENT OF THE VERSAILLES TREATY

Some portions of the Treaty of Versailles such as the guarantees of its execution prescribed in Part 14 were merely recognitions of *faits accomplis*, and others were speedily put into operation. The League of Nations and the International Labor Organization authorized by Parts 1 and 13 respectively were early established—the first International Labor Conference being held in 1919 and the first session of the League of Nations being convened in 1920. Part 7 relating to penalties proved practically impossible of execution. On the ground that no existing International Court possessed legal jurisdiction, the Dutch government refused to comply with reiterated allied demands for the extradition and trial of the former German Emperor, and in March, 1920, the "solemn farce" was terminated by an understanding that William II would be indefinitely interned in Holland and prevented from participating in any further international mischief. A similar demand made upon Germany in February, 1920, for the extradition of some 882 war criminals, including civilians and military and naval officers of high rank, was finally abandoned in favor of a German proposal that the accused be tried by a German Federal Court at Leipzig. The Inter-allied Justice Commission promptly transmitted to Berlin the names of some 46 offenders against whom

the evidence was most conclusive, the Allies reserving the right to hold retrials should they consider the verdicts palpably unjust. The Germans were very dilatory about proceeding to try these men and though the matter was discussed at the Spa Conference (July 5-16, 1920) it was not until after the Allied ultimatum of Apr. 30, 1921, demanding action on this point among others, that trials began at Leipzig. A few convictions resulted but the whole proceeding was rather farcical.

Territorial cessions and boundary readjustments prescribed under Parts 2, 3, and 4 were effected as far as Germany was concerned without great difficulty except in the case of Upper Silesia. The economic sections of the treaty relating to Ports, Waterways and Railroads, etc., occasioned some difficulty, but the really great conflicts took place over German disarmament, involving the all-important issue of French security, and over reparations involving a whole complex of issues such as time and methods of payment, inter-allied allocation of the proceeds, inter-allied cancellation of debts, the restoration of northern France, Belgium etc., the economic rehabilitation of Europe, French security, extension of Allied occupation of German territories (e.g. seizure of the Ruhr), and the maintenance or disruption of Allied solidarity. (See REPARATIONS.)

The treaties of 1919-1920 as we have seen, provided for the unilateral application of the principle of disarmament with the avowed purpose of attaining that long sought objective—the destruction of German militarism. Throughout 1920, the Allies had to insist on reduction of the German army to the 100,000 limit imposed by the treaty. At the Spa conference (April 18-25) Premier Millerand, yielding to an Italian demand for trade negotiations with Russia, and to Lloyd George's Near Eastern importunities, secured as the price of his consent on these two points, a joint demand upon Germany for immediate disarmament, a refusal of a German request for a permanent army of 200,000 men, and a severe warning against future infractions of the Treaty. At the Spa Conference (July 5-16) German disarmament was the first question considered. After a heated discussion Germany in return for her promise to disband immediately certain auxiliary forces such as the *Sicherheitspolizei* and *Einwohnerwehr*, was finally granted (July 9) permission to postpone until Jan. 1, 1921 the reduction of her army to the prescribed limit, though it was stipulated that it should not exceed 150,000 effectives after Oct. 1, 1920. As a guarantee of her faithful execution of these requirements, the Allies reserved the right to invade and occupy the Ruhr Valley or other regions. After the Spa Conference the question of German disarmament continued to be the subject of numerous notes exchanged between the Entente Powers and the German government. The Germans, however, failed to live up to their promises, and disarmament along with reparations again came to the fore at the Paris Conference Jan. 24-29, 1921, at which time they were given until July 1 to comply with the Spa agreement. Persistent dilatoriness on this point together with non-payment of reparations and postponement of war-crime trials, led to the issuance of an ultimatum (May 7, 1921) by the London Conference threatening invasion of the

Ruhr should not the Germans without reservations comply with treaty requirements by May 12. On May 10 the Reichstag voted to submit. Thereafter better progress was made. The work of disarmament continued under the supervision of the inter-allied military control commission. French security constituted an important subject of discussion at the Cannes Conference January, 1922. As the best method of adequately protecting France against attack and of fostering peace in Europe, Lloyd George, voicing English opinion, advocated a tripartite agreement embracing England, France, and Germany. Premier Briand vehemently opposed this plan and demanded an Anglo-French military alliance. After considerable parley, a 10-year treaty was signed (but never ratified) by which both powers reaffirmed their common interest in those provisions of the Versailles Treaty relative to German fortifications and military activities along the Rhine; both powers undertook also to act in concert should Germany take any measures incompatible with the Treaty, and Great Britain specifically promised to place her naval, military, and aerial forces at the disposal of France in the event of direct and unprovoked aggression by Germany. Bitter opposition in the French Chamber of Deputies to Premier Briand's promises to moderate his attitude toward Germany led to his supersession by the nationalistic Poincaré. This change in the French government put an end temporarily to the chance of recentring Entente solidarity and foreshadowed the military occupation of the Ruhr. At the Genoa Conference (Apr. 10-May 15, 1922) Lloyd George proposed a 10-year European non-aggression compact, but the French refused to accept this plan unless every other European nation agreed to sign, unless Russia recognized all her existing boundaries during the 10-year period and unless France forfeited none of her rights for enforcement of the Versailles Treaty. During 1920-1921, France and Great Britain had drifted apart due to divergence of interests and policies, as regards German reparations, Poland and relations with Russia, and Turkey and the Near Eastern settlement. On January, 1923, the Franco-Belgian seizure of the Ruhr further undermined their relations, and by 1924 the *entente cordiale* of 1904 had been definitely transformed into suspicion and dislike, exacerbated not only by the above-mentioned differences on questions of policy but also by a keen rivalry in aeronautical expansion. France, meanwhile, in an endeavor to stabilize the treaties of which she had been the most active and powerful defender, had forged a network of alliances with other European states. In July, 1920, a defensive alliance was concluded with Belgium; in February, 1921, with Poland; and in 1924 with Czecho-Slovakia and Rumania. France therefore, became by the spring of 1924, the leading spirit in a system of European alliances maintaining standing armies aggregating nearly 2,000,000 men, and consecrated to the preservation of the newly made peace treaties by force if necessary. However, with the advent to power of the Labor ministry in Great Britain (January, 1924) and the replacement in France of the Nationalist government of Poincaré by a Radical-Socialist ministry under Herriot (June, 1924), the prospects of a European settlement perceptibly brightened. The avowed intentions of

Premiers Macdonald and Herriot to pursue more pacific policies and to utilize the League of Nations as a universal guarantee of national security and an instrument of international co-operation, the favorable reception of the Dawes Report, the evidence of a new coöperative spirit in Germany regarding reparations and disarmament, the more widespread resumption of amicable relations with Russia, and the favorable outcome of the London Conference of July-August, 1924, all seemed to presage a new era in the liquidation of post-war problems of reconstruction and readjustment. Other phases of international post-war problems are discussed under the following heads: LEAGUE OF NATIONS; LABOR ORGANIZATION, INTERNATIONAL; MANDATES; REPARATIONS; WASHINGTON CONFERENCE; RACIAL MINORITIES TREATIES. For national points of view, see the history sections under the articles UNITED STATES; GREAT BRITAIN; FRANCE; GERMANY; RUSSIA; TURKEY; AUSTRIA; HUNGARY; etc. Detailed treatment of the territorial and political disputes that arose out of the making of the Peace and its application will be found under the following: TIROL, GERMAN SOUTH; BURGENLAND; FIUME-ADRIATIC CONTROVERSY; KLAGENFURT; THRACE; BANAT; TRANSYLVANIA; BESSARABIA; BUKOVINA; SILESIA, UPPER; TESCHEN, ZIPS, AND ORAVA; DANZIG; ALLENSTEIN-MARIENWERDER; GALICIA; VILNA; MEMEL; LITTLE ENTENTE; SAAR BASIN; EUPEN, MALMÉDY, AND MORENET; LIMBURG, SOUTHERN; LUXEMBURG; SCHLESWIG; RHINELAND; DODECANESE; SMYRNA; CILICIA; DARDANELLES AND BOSPORUS STRAITS; KURDISTAN; SHANTUNG. See the articles EUROPE AND AFRICA for a general presentation of the territorial readjustments effected by the War in these two continents.

For preliminary discussions of peace, see WAR, DIPLOMACY OF THE.

**PEACH BORER.** See ENTOMOLOGY, ECONOMIC.

**PEAR THRIPS.** See ENTOMOLOGY, ECONOMIC.

**PEARL, RAYMOND** (1879- ). An American biologist and statistician, born in Farmington, N. H., and educated at Dartmouth and the University of Michigan. He taught at the latter and the University of Pennsylvania until 1907, when he received the appointment of biologist and head of the department of the Maine Agricultural Experiment Station. He resigned this position in 1918 to become professor of biometry and vital statistics at the Johns Hopkins University. School of Hygiene and Public Health. He was also made official statistician of the university and consultant in vital statistics and epidemiology to the United States Public Health Service. His published works comprise: *Modes of Research in Genetics* (1915); *The Nation's Food* (1920); *The Biology of Death* (1922); *Introduction to Medical Biometry and Statistics* (1923). In collaboration with Mitchell he wrote the *Reference Handbook of Food Statistics*.

**PEARSE, ARTHUR SPERRY** (1877- ). An American zoölogist, born at Crete, Neb., and educated at the University of Nebraska and Harvard. He was Austin teaching fellow at Harvard (1907-08); instructor in zoölogy (1909-10) and assistant professor (1910-11) at the University of Michigan; assistant professor of zoölogy at the University of the Philippines for three months in 1911; and associate

professor (1912-19) and professor of zoölogy (1919- ) at the University of Wisconsin. Professor Pearse published articles on animal behavior, fishes, and crustacea, as well as *General Zoölogy* (1917).

**PEGRAM, GEORGE BRAXTON** (1876- ). An American physicist, born at Trinity, N. C., and educated at Trinity College, Durham, N. C., at Columbia University, and at Berlin and Cambridge. In 1900 he became assistant in physics at Columbia, where in 1916 he became full professor and in 1917 dean of the faculty of applied science. He was a magnetic observer with the United States Coast and Geodetic Survey (1902-06). Dr. Pegram made original studies on the electromagnetic theory and on radioactivity.

**PEIXOTTO, ERNEST CLIFFORD** (1869- ). An American artist, born in San Francisco. He studied in Paris as a pupil of Benjamin Constant and Jules Lefebvre at the Académie Julien. He spent much of his time in Europe writing and illustrating for American periodicals and during the War directed the American Expeditionary Forces art training centre at Bellevue, France. He was elected Associate of the National Academy in 1919 and Chevalier of the Legion of Honor in 1921. Besides having exhibited many pictures at the Paris Salon and in leading American galleries, he produced many books on travel in Europe and America. He executed mural friezes and was director of mural painting at the Beaux-Arts Institute of Design, New York, after 1919. His later books include: *By Italian Seas*; *Through the French Provinces*; *Romantic California*; *Pacific Shores from Panama*; *Our Hispanic Southwest*; *A Revolutionary Pilgrimage*, and *The American Front*.

**PELLAGRA.** The nature of this strange malady was not cleared up in the interval between 1914 and 1924; if anything, less was known about it in 1924 than ever. In the south of Europe, pellagra was known continuously for centuries and seemed to be nothing more than a form of poisoning by spoiled maize. Study in the United States showed many facets of the disease, and now it is known that many who have been committed to insane asylums in the northern States, Canada, Great Britain, and other cool countries in which pellagra has never been recognized, have in reality been sufferers from this same affection. Cases were reported in England, where maize is not eaten, and once attention had been focused on the possibility of further cases, numbers were recognized among the insane population, and the supposition that this is nothing new asserted itself. The theory of spoiled maize which was reasserted in connection with new cases of the disease in Rumania gave way to another, after the discovery of vitamine, to the effect that pellagra is not a form of food intoxication but is due to the absence of some vitamine-like principle in the food. This view was soon shown to be fallacious, but it was found that the disease could at times be prevented by a well-balanced, nutritious diet, while pellagrins also improved and even appeared to recover on such a diet. The theory of a deficient diet was partly exploded by the discovery that in California and Louisiana prosperous and well-nourished people were developing the disease. Despite all negative evidence, it cannot be denied that in one locality spoiled maize and in another a merely defective diet has precipitated the dis-

ease, and that when the cause was withdrawn the disease receded. In 1924 it seemed that several quite dissimilar factors could either predispose to or excite the disease and that the essential causal factor was as yet unknown.

**PELLE, M. C. J.** (1869-1924). A French soldier and diplomat, born in 1869. During the War he was chief of staff to Marshal Joffre and in 1920 was appointed High Commissioner to Constantinople. He endeavored to bring about a cessation of hostilities between the Turks and the Greeks and to promote harmony between the Turks and the Allies. He was one of the signers of the Treaty of Lausanne. Later he was sent to Czechoslovakia as chief of the French mission, and on Mar. 15, 1924, the French government conferred on him the Grand Cross of the Legion of Honor in appreciation of his services.

**PELLIOT, PAUL** (1878- ). A French archaeologist and Orientalist, born in Paris. In 1899 he was made a member of the Archaeological Mission to French Indo-China, subsequently the French School of the Far East. In 1905 he was named by the Minister of Education to head an archaeological expedition to Central Asia and China, to investigate traces of pre-Islamic Buddhism in China. At Tunchuk, in the Chinese Turkestan, Pelliot discovered the ruins of a Buddhist temple built in the Græco-Buddhist style, and from there he was directed to a monastery at Tuen Huang, where he made an amazing find of some 15,000 manuscripts and silk paintings. He brought back most of the manuscripts as well as other objects of historical value to Paris. The collection of Chinese manuscripts which he organized at the Bibliothèque Nationale was larger than any to be found in China proper. The manuscripts, which all date before the eleventh century, are in Chinese, Tibetan, and Sanskrit. The French government rewarded Pelliot for his expedition by creating for him at the Collège de France a chair on the languages, history, and archaeology of Central Asia. In 1921 he was elected to the Academy of Inscriptions. A catalogue and description of the findings of his expedition was published under the title *La Mission Pelliot en Asie Centrale*, 5 vols. (1914-21).

**PENANG.** See STRAITS SETTLEMENTS.

**PENNELL, JOSEPH** (1860- ). An American etcher, illustrator, and author (see VOL. XVIII). His later publications include *Pictures of War Work in America* (1918) and *Etchers and Etching* (1919). With his wife he edited *The Whistler Journal* (1921). He was chairman of the jury of the International Exhibition at Leipzig in 1914 and also at the Panama-Pacific Exposition in 1915, where he was awarded a commemorative medal. He won the Grand Prix in Florence in 1915 and was elected to the American Academy of Arts and Letters in 1922. In recent years he has conducted a wide and influential propaganda for better education in the graphic arts in the United States.

**PENNINGTON, MARY ENGLE** (1872- ). An American chemist, born at Nashville, Tenn., and educated at the University of Pennsylvania, where she was a fellow in botany. During 1897-98 she was a fellow in physiological chemistry at Yale. In 1898 she became director of the chemical laboratory of the Women's Medical College of Pennsylvania, meanwhile serving as chief of the Philadelphia Chemical Labora-

tory. These positions she resigned in order to accept the office of chief of the food research laboratory of the Bureau of Chemistry in Washington (1908), which she held until 1919, when she became manager of the research and development division of the American Balsa Company of New York. Her original investigations pertained to the chemical, bacteriological, and histological study of flesh foods, as well as of milk, on which she published her results in the publications of the American Chemical Society, the Society of Biological Chemists, and other scientific organizations.

**PENNSYLVANIA.** Pennsylvania is the thirty-second State in size (45,126 square miles) and the second in population; capital, Harrisburg. The population increased from 7,665,111 in 1910 to 8,720,017 in 1920, a gain of 13.8 per cent. The white population increased from 7,467,713 to 8,432,726; negro, from 193,919 to 284,568; native white, from 6,028,994 to 7,044,876. The foreign-born white population decreased from 1,438,719 to 1,387,850. Both urban and rural populations increased in the decade, the former from 4,630,669 to 5,607,815; the latter from 3,034,442 to 3,112,202. The growth of the principal cities was as follows: Philadelphia, from 1,549,008 in 1910 to 1,823,779 in 1920; Pittsburgh, 533,905 to 588,343; Scranton, 129,867 to 137,783; Reading, 96,071 to 107,784; Erie, 66,525 to 93,372. See articles on these cities.

**Agriculture.** Pennsylvania is one of the greatest of the eastern agricultural States, but in common with nearly all of them it showed a general decline in agriculture during the decade 1910-20. While the population of the State increased 13.8 per cent in that decade, the rural population decreased from 45.3 per cent in 1900 and 39.6 per cent in 1910, to 35.7 per cent in 1920. The total acreage in farms in 1910, 18,586,832, fell off to 17,657,513 in 1920, or 5 per cent. The number of farms decreased from 219,295 to 202,250 or 7.8 per cent; the improved land in farms, from 12,673,519 acres to 11,847,719, or 6.5 per cent. The percentage of total land area used for agricultural purposes decreased from 64.8 in 1910 to 61.5 in 1920; the percentage of land improved, from 68.2 to 67.1. The total value of all farm property showed an apparent increase, from \$1,253,274,862 to \$1,729,353,034, or 38 per cent; the average value per farm, from \$5715, to \$8551. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 202,250 farms in 1920, 153,498 were operated by owners, 4490 by managers, and 44,262 by tenants. The comparative figures for 1910 were 164,229, 3961, and 51,105. White farmers in 1920 numbered 201,799, of whom 187,277 were native and 14,522 foreign-born. The negro farmers numbered 451. Farms free from mortgage in 1920 numbered 93,804, compared with 112,156 in 1910. Those under mortgage numbered 48,498, compared with 50,699 in 1910. The total number of dairy cows in 1920 was 1,049,763; 933,640 in 1910. "Beef cows" numbered 57,440, compared with 99,220 in 1910; and sheep declined in number from 637,541 to 508,711. There were 977,637 hogs in 1910, and

1,190,951 in 1920. The estimated production of the principal farm crops in 1923 was as follows: corn, 62,062,000 bushels; spring wheat, 221,000; winter wheat, 24,168,000; oats, 31,996,000; rye, 3,655,000; barley, 282,000; potatoes, 20,539,000; sweet potatoes, 235,000; tobacco, 57,408,000 pounds; buckwheat, 4,434,000 bushels; and hay, 3,019,000 tons. Comparative figures for 1913 are: corn, 57,057,000 bushels; wheat, 21,862,000; oats, 35,774,000; rye, 4,900,000; barley, 182,000; potatoes, 23,320,000; hay, 4,146,000 tons; and tobacco, 46,680,000 pounds. The apple crop in 1909 amounted to 11,048,430 bushels; in 1919, to 5,512,795. The production figures for peaches in those years were 1,023,570 and 1,099,737 bushels, respectively.

**Mining.** Pennsylvania, in point of value of products, is most important of the mineral-producing States. In the order of their importance, these products are coal, cement, natural gas, and clay products. Petroleum, of which the State was the original and for many years the chief producer, lost importance through the gradual exhaustion of the wells and the discovery of large areas of petroleum land in other States. Pennsylvania is the only State which produces both anthracite and bituminous coal. All the anthracite coal produced is obtained from the Pennsylvania fields. The progress of the coal mining industry during the decade 1914-24 is indicated by the following production figures: 1914, bituminous, 147,983,294 net tons valued at \$159,006,296; anthracite, 90,821,507 net tons valued at \$188,181,399. 1915, bituminous, 157,955,137, \$167,419,705; anthracite, 88,995,061, \$184,653,498. 1916, bituminous, 170,295,424, \$221,685,175; anthracite, 87,578,493, \$202,009,561. 1917, bituminous, 172,448,142, \$421,268,808; anthracite, 99,611,811, \$283,650,723. 1918, bituminous, 178,550,741, \$463,159,736; anthracite, 98,826,084, \$336,480,347. 1920, bituminous, 170,607,847, \$642,630,000; anthracite, 89,598,249, \$434,252,198. 1921, bituminous, 116,013,942, \$322,538,300; anthracite, 90,473,451, \$452,304,903. In 1922 the bituminous production was 113,148,308 net tons; the anthracite, 54,683,022. The greatly increased value of coal in the later years of the decade was due partly to conditions arising from the coal miners' strikes and partly to the inflation of the currency. In shipments of Portland cement Pennsylvania ranks first among the States, with 25,985,106 barrels, valued at \$20,944,787, in 1914; 28,748,546 barrels, \$27,915,298, in 1916; 22,238,689 barrels, \$33,600,956, in 1918; 27,662,116 barrels, \$52,632,082, in 1920; and in 1922, 34,023,695 barrels. The production of petroleum during this period averaged about 8,000,000 barrels per year: In 1914 it was 8,170,335 barrels; 1916, 7,592,394; 1918, 7,407,812; 1920, 7,438,000; 1922, 7,425,000. In addition to the minerals noted above, the State produces large quantities of clay products, natural gas and natural gas gasoline, sand and gravel, and stone. The total value of the mineral products in 1921 was \$944,688,650, compared with \$1,314,332,585 in 1920; \$918,048,917 in 1919; \$979,245,098 in 1918, and \$452,824,034 in 1914.

**Manufactures.** Pennsylvania, ranking second among the States in industrial importance, was surpassed only by New York. There were, in 1920, 77 cities having more than 10,000 inhabitants, which formed 50.8 per cent of the total population of the State and which reported, in

1919, 63.7 per cent of the State's manufactured products. There were in the State, in 1909, 27,563 manufacturing establishments; in 1914, 27,521; and in 1919, 27,973. Persons engaged in manufacture numbered 1,002,171, 1,060,562, and 1,323,662; and the capital invested amounted to \$2,749,005,975, \$3,149,411,089, and \$6,177,729,968, in those years. The value of products in 1909 was \$2,626,742,034; in 1914, \$2,832,349,437; and in 1919, \$7,315,702,867. The large increase in the value of products in 1914-19, was, however, due largely to changes in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the period; but the increase in number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. Steel works and rolling mills, chief in point of value of product, had an output valued, in 1909, at \$500,344,000; 1914, \$448,106,000; 1919, \$1,296,412,000. Foundry and machine shop products rank second in this respect, amounting in 1909 to \$210,746,000; 1914, \$233,616,000; and 1919, \$624,415,000. Iron and steel blast furnace production is third in value of output: in 1909, \$168,578,000; in 1914, \$135,806,000; in 1919, \$311,080,000. Ship and boat building, in fourth place, in 1909 amounted to \$6,178,000; 1914, \$9,540,000; and in 1919, \$237,325,000. The extraordinary increase in the value of the shipbuilding industry from 1914 to 1919 was due, of course, to the unusual demand for ships during the War, and cannot be taken as an index of the normal increase of the industry. The most important manufacturing cities of the State are Philadelphia, Pittsburgh, and Reading. There were (1909), in Philadelphia, 8375 manufacturing establishments, with a product valued at \$743,720,000; in 1914, 8545, with \$784,500,000; and in 1919, 9064, with \$1,996,481. In Pittsburgh, in 1909, there were 1658 with \$243,392,000; in 1914, 1741 with \$246,694,000; and in 1919, 1875 with \$614,727,000. Similar figures for Reading are: in 1909, 482, with \$51,135,000; in 1914, 486 with \$53,232,000; and in 1919, 527 with \$141,561,000. Other manufacturing cities are Allentown, Altoona, Bethlehem, Erie, Scranton, and Wilkes-Barre.

**Education.** While Pennsylvania has always been aggressive in the education of its citizens, in many respects the laws under which its system was administered both previous to and during the decade 1913-23 were unsatisfactory. To remedy this condition the Legislature of 1921 passed a number of laws. These provided for the raising of the standard qualifications of teachers; established a higher schedule of salaries; added to the support of the normal schools, increasing their facilities and improving their work; increased the length of the school term, especially in fourth-class districts; reinforced compulsory school attendance; established State aid to local communities for the maintenance of new and higher standards; established a budget system in every school district; encouraged the consolidation of rural schools; and centralized and unified the State school administration by abolishing the State Board of Education and the college and university council and creating in their place the State Council of Education. These new measures were proving most beneficial in their results. One of the best evidences of the results was the remarkable response of the teachers to

the new demands for improved qualifications; for nine weeks during the summer vacation in 1922, more than 25,000 school teachers attended summer school, taxing the colleges and normal schools of the State to their utmost capacity. The total number of pupils in the State in 1913-14 was 1,401,325. This had increased in 1920-21 to 1,709,677. The enrollment in kindergarten and elementary schools in the latter year was 1,514,825; in the high schools, 194,852. The total expenditures for education increased from \$52,544,036 in 1913-14 to \$129,344,699 in 1921-22. The percentage of illiteracy in the State decreased from 7.3 in 1910 to 6 in 1920; among the native white population, from 1.8 to 1; among the foreign-born white, from 20.8 to 20.1; and among the negro population from 11 to 7.3.

**Finance.** For finance, see article on STATE FINANCES.

**Political and Other Events.** Pennsylvania remained strongly Republican as heretofore in the decade 1914-24. In 1914 elections were held for United States Senator and for Governor and other state offices. Martin G. Brumbaugh, Republican, was elected governor, against Vance G. McCormick, Democrat. The Republican candidate for reelection to the Senate was Boies Penrose. He was opposed by A. Mitchell Palmer, Democrat, and Gifford Pinchot, Washington party. Senator Penrose received 519,801 votes; Pinchot, 269,265; and Palmer, 266,415. In 1916 Philander C. Knox, Republican, was elected to the United States Senate. In the presidential election that year Charles E. Hughes received 703,823 votes; Woodrow Wilson, 521,784. The 1917 municipal primary elections in Philadelphia and Pittsburgh were marked by more than ordinary factional bitterness which had not been entirely eliminated up to 1924. There was serious trouble in Philadelphia, where a number of officials were accused of having brought gunmen from New York into one ward to influence the election. In 1918 William Cameron Sproul, Republican, was elected governor, together with the entire State ticket of that party. At the same election the people approved a constitutional amendment providing a \$50,000,000 bond issue for highways. In 1920 Boies Penrose was reelected to the Senate, with 1,067,989 votes. John A. Farrell, Democrat, received 484,362 votes, while 132,610 were cast for Leah Cobb Marion, Prohibitionist, the first woman in a Pennsylvania State-wide political contest. In the presidential voting Warren G. Harding received 1,218,216 votes; James M. Cox, 503,843. President Harding appointed two Pennsylvania Republicans to cabinet positions. They were Andrew W. Mellon, Secretary of the Treasury, and James J. Davis, Secretary of Labor. In 1921 the people rejected a proposal to hold a constitutional convention. Senator Knox died suddenly in October, 1921, and William E. Crow of Uniontown was named by Governor Sproul to succeed him. Senator Penrose, the recognized leader of the State Republican organization, died on New Year's Eve of the same year. George Wharton Pepper of Philadelphia was appointed to his place. In August, 1922 Senator Crow died. He was succeeded by David Aiken Reed of Pittsburgh. The Republican primary election in May, 1922, was marked by a bitter contest for the gubernatorial nomination between Gifford Pinchot, supported by the Progressive element,

and Attorney General George E. Alter, whose chief support came from the Philadelphia and Pittsburgh organizations. Pinchot's majority was 9259 votes, and he was elected Governor in November over John A. McSparran, Democrat, head of the State Grange. Senators Pepper and Reed were elected at the same time. In 1923 Governor Pinchot was largely instrumental in averting the threatened anthracite coal miners' strike. In the spring election of 1924 the people approved another constitutional amendment providing an additional \$50,000,000 bond issue for roads. The most interesting event of that election was the defeat of Governor Pinchot for delegate-at-large to the Republican national convention by an eleventh-hour attack on the part of disgruntled political leaders and liquor interests led by Representative William S. Vare of Philadelphia. In June, 1924, W. Harry Baker was reelected chairman of the Republican State Committee without opposition, while Joseph F. Guffey, after a bitter fight, seized control of the Democratic organization in spite of opposition from the faction headed by Judge Eugene C. Bonniwell and Judge Samuel E. Shull and from the wing led by Vance McCormick and Bruce F. Sterling. John Bigelow, a Guffey adherent, was elected Democratic chairman. Before the general election of 1924 the political complexion of Pennsylvania's congressional delegation was: Senate—Republican, 2; House—Republican, 30; Democratic, 6.

**Legislation.** The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1915 approved a resolution for a State constitutional amendment providing for woman suffrage; this was voted down by the people by a 55,686 majority. In 1917 a direct inheritance tax law was passed. As a war measure a State council of defense was created and \$5,000,000 provided for it. The 1919 Legislature ratified the woman suffrage amendment to the national Constitution on January 24 and the prohibition amendment on February 25. In 1921 bitter opposition developed to a legislative programme proposed by Governor Sproul. On April 25 his supporters held a rump session, ousted the Speaker, elected another in his place, and passed all administration measures. These included taxes on anthracite coal and gasoline, a measure repealing non-partisan election laws in Pittsburgh and Scranton, and a bill creating a State department of public welfare. The 1923 Legislature, with eight women members, repealed the high license law for saloons and adopted one more in harmony with the Volstead Act. It passed a modified old-age pension bill, approved a measure providing for a constitutional convention in 1926, subject to the approval of the voters, and favored a constitutional amendment providing a \$35,000,000 bond issue for a soldiers' bonus, which had been approved by the 1921 Legislature also. The gasoline tax was increased and a small tax placed on profits, but proposals to tax bituminous coal and the capital stock of manufacturing corporations and to repeal the anthracite coal tax were defeated. An extensive reorganization of the State government, proposed by Governor Pinchot, was adopted. A series of 12 election reform bills was defeated. In 1924 the State Supreme Court ruled that owing to technical defects the proposed soldiers' bonus amendment could not be

submitted to the people. In July, 1924, the Dauphin County court held the old-age pension bill unconstitutional. Constant legislative efforts to improve the educational facilities of the State resulted in an elaborate educational system for which the 1923 Legislature appropriated \$46,401,881 to be administered by the Department of Public Instruction.

**PENNSYLVANIA, UNIVERSITY OF.** Located in Philadelphia, Pa.; founded in 1740 and developed by Benjamin Franklin. During the 10-year period from 1914 to 1924 the university developed in every line. The student enrollment increased from 2245 in 1914 to 8302 in the regular courses, and 7438 in the extension courses in 1923-24. The faculty increased from 241 to 1100 members including administrative officers and research workers. The library increased from 75,000 to 548,387 volumes. The development of the university during this period was shown by the establishment of the following separate schools, each with its own dean or director: (1) the School of Education, established in 1914; (2) the Graduate School of Medicine, said to be the only one of its kind in existence, formed in 1919 by a merger with the university of the Medico-Chirurgical College and Hospital and the Philadelphia Polyclinic Hospital and College for Graduates in Medicine; (3) the School of Hygiene and Public Health, developed in 1920 from the former Laboratory of Hygiene; (4) the School of Fine Arts, formed in 1920 by a merger of the former separate departments of music and architecture; (5) the Moore School of Electrical Engineering, established in 1923 by a merger of the courses at the university in electrical engineering with the School of Electrical Engineering provided for in the will of the late Alfred Fittler Moore. The new school had an endowment of approximately \$1,600,000. Other developments were the establishment of a course in military science and tactics in 1917 and the construction in 1922, at a cost of \$825,000, of the new stadium on Franklin Field, which had a seating capacity of 55,000.

A number of important gifts were received by the university during this period. Among them was a gift of \$400,000 from the estate of Dr. J. William White to establish the White professorship of surgical research; a gift of \$500,000 from Helen T. Massey to increase the salaries of faculty members in the College; a gift of \$549,736 from the estate of William B. Irvine to construct an auditorium; and a gift of \$113,518 from the estate of Abraham S. Wolf through the generosity of Miriam H. Wolf for a ward in the University Hospital. New buildings erected included the J. William White-Surgical Pavilion; a maternity building for the University Hospital, and a new wing for the University Museum.

The dismissal of Prof. Scott Nearing in 1915, on the ground that he made speeches of a radical nature which injured his usefulness as a member of the faculty, attracted wide attention, and much was published in defense and criticism of the action. Fifteen hundred of the students signed a petition asking the Board of Trustees to recall Dr. Nearing, but they declined to reconsider their decision.

During the War the university conducted its regular courses in military science and tactics and maintained training units for the United States Army and Navy. It also organized a

base hospital in France, seven Red Cross units, and three ambulance units.

Edgar Fahs Smith, Ph.D., Chem.D., Sc.D., Litt.D., LL.D., LL.D., resigned as provost in 1920 and was succeeded by Josiah H. Penniman, Ph.D., LL.D., as acting provost. Dr. Penniman was elected provost in January, 1923, and president of the university in October, 1923.

**PENNSYLVANIA STATE COLLEGE.** A nonsectarian, coeducational institution at State College, Centre County, Pa., founded in 1859. The student enrollment of the college increased from 2245 in 1914 to 3300 undergraduates and professional students and 150 graduate students in the year 1923-24, with more than 2000 in the summer session of 1923; the faculty increased from 241 to 631 members, with 320 resident members, 31 research workers, and 280 extension workers; the library increased from 75,000 to 81,000 volumes. A group of four large engineering buildings was completed in the decade in addition to a mechanical engineering building finished in 1920. A new residence hall for men and a new beef cattle barn were completed in 1923, and an 18-hole golf course was laid out. Farm land holdings were increased to 2000 acres and the campus proper to 200 acres. A Graduate School was authorized in 1922, and a School of Education was created in 1923. John Martin Thomas, D.D., LL.D., formerly president of Middlebury College, Vt., in 1921 succeeded Edwin Erle Sparks, LL.D., as president.

**PENNSYLVANIA UNIVERSITY MUSEUM.** See EXPLORATION.

**PENOLOGY.** The outstanding event in penology within the decade 1914-24 was the extension of the plan of inmate self-government to prisons for male adults. This plan was not of sentimental origin, as some critics have charged, but was based on the therapeutic principle that to reform law-breakers it is wise to hold them during confinement in a social *milieu* similar to that into which they will later be discharged, and further to give them an opportunity to use, under such limits as restraint imposes, those faculties or qualities of self-reliance, initiative, judgment, and responsibility which normal life requires. As such, it is opposed to the traditional system of autocratic discipline or rule in prisons, by which substantially every movement of the prisoner's day is fixed for him. Self-government had been a feature of the George Junior Republic, founded by William R. George at Freeville, N. Y., in 1895, and in 1912 Calvin Derrick had adapted the plan to the State reformatory at Ione, Cal. The first extension of the idea to adult male prisoners was made at the New York State prison at Auburn, N. Y., in 1914 under the unofficial inspiration and guidance of Thomas Mott Osborne, who later in the same year became warden of Sing Sing, another prison for confirmed male offenders in the same State, and incorporated the plan there. In both instances the self-governing body was named the Mutual Welfare League. Each incoming prisoner became a participant in the self-governing activities and could be expelled by the members. The activities consisted of advising and to a large extent conducting the routine affairs of the prison; this was done both through elected officials from the mass of prisoners and through committees. The prisoners handled much of

the discipline of the prison also and punished their own members through inmate courts. Later, Osborne put the plan into effect at the United States Naval Prison at Portsmouth, N. H., where he was commandant for two years. At none of these three places did it remain in effect in 1924, except in a somewhat emasculated form at Sing Sing. The State reformatories at Rahway, N. J., and Cheshire, Conn., adopted the plan for a time but abandoned it. It is now in effect at the Westchester County Penitentiary at White Plains, N. Y., and at the New Jersey State Reformatory for Women at Clinton, N. J. A beginning toward its adoption was made at the Detroit House of Correction. At a number of other penal institutions there were modifications in the traditional autocratic régime in response to the educational effect of the self-government idea.

Unquestionably the decade saw a rapidly growing interest in the law-breaker and a more scientific approach to the difficulties of his treatment. This was evidenced by a number of careful studies of State and municipal penal systems in the United States. In 1916 the New Jersey Prison Inquiry Commission made a searching study of all correctional and penal institutions in that State. A similar study was made in Pennsylvania in 1917-18. The National Committee on Prisons and Prison Labor made a study of the District of Columbia's penal institutions, and the Prison Survey Committee of New York State published the results of a survey of the penal system of that State in 1920. A very thorough study of the penal system of Texas was begun by the Texas Committee on Prisons and Prison Labor in 1923. In all these studies the aim was to supply information in regard to the disciplinary, educational, vocational, dietetic, medical, and other aspects of penal and correctional systems on which improvements calculated to make offenders better members of society could be based. The Cleveland Foundation, after an exhaustive study of criminal justice in Cleveland, published its report in 1922; this covered police administration, prosecution of accused persons, criminal courts, correctional and penal treatment, medical science and criminal justice, legal education, and newspapers and criminal justice. The range of this and other studies showed a growing realization that whatever society does to an offender, from his first apprehension to his ultimate release from prison, is part of a continuous process, and that from the point of view of its effect on him, each step in the process must be taken into account.

In general, actual treatment in penal and correctional institutions may be said to have responded slightly to the doctrine that, since all prisoners except those who are killed or actually confined for life, are ultimately restored to society, they should be so treated as to make them better members of society. This has led, with other things, to an agitation for more vital education and a more educative vocational life. Farm prisons on wide acreage have been established in several States, and more careful assignment of prisoners to work has been made in some prisons. The principles of the indeterminate sentence, probation, suspended sentence (especially for first offenders), separate or juvenile courts for children, and parole or after-care attention for released prisoners were accepted to a somewhat greater extent by

judges, lawmakers, and prison officials; probation was slightly extended to adult offenders. On the other hand, the United States Supreme Court held that Federal courts did not have power to suspend sentence or to use probation; bills granting such power were presented at each subsequent session of Congress. The county jail, in which both sentenced prisoners and persons merely awaiting trial were commonly kept, was increasingly seen in a bad light, although little actual attempt was made to improve it or to alter its function. Under the influence of so-called "crime waves" in a number of cities, some Legislatures increased the severity of penalties; four States which had abolished capital punishment restored it. The War, too, had a deterrent influence on reform, although both in the United States and Great Britain it had in one way a good effect; prisoners sentenced under espionage and other war-time acts have, on their release, written vividly about prison evils and so awakened public consciousness toward them.

It is already evident that penology will in time be profoundly affected by developments during the decade in criminology. These have to do with closer study of the heredity, environment, and mental peculiarities of individual offenders. The purpose of such studies is twofold: first, to discover general causes of crime; secondly, to discover those causes operating in an individual which may make successful treatment more assured. In such studies every branch of psychology is called into play. William Healy made perhaps the first notable contribution to the study of mental peculiarities in offenders when he published *The Individual Delinquent* (Boston, 1915), based on a study of juvenile law-breakers in Chicago. Some earlier research had been done in Germany, and since then numerous detailed investigations of other groups have been undertaken. The Bureau of Social Hygiene, originally organized at the New York State Reformatory for Women at Bedford Hills, N. Y., conducted several such studies. A psychiatric clinic for the study of offenders was formed at Sing Sing under Osborne, and psychiatric work was done at other prisons. Several States created the position of State criminologist. In general, the theory underlying this development is that crime, like all conduct, is the reaction of a particular personality to a particular environment, and that successful therapy or reformatory treatment requires the discovery of those factors in the personality or the environment, or both, which cause crime, and their removal or modification. Some courts made much use of diagnostic mental reports on offenders before sentencing them, and some prisons used such studies of inmates in treatment in prison. In general, however, actual application in institutions of psychiatric information and methodology was slight.

Although the United States is the only great civilized country which does not gather its criminal statistics, a special committee of the American Bar Association made interesting comparisons in 1923. From 1910 to 1922, according to this committee, the general population in this country increased 14.9 per cent; the criminal population 16.6 per cent. Crime decreased noticeably during the War but afterward rose. The country continued to have far more crimes than western Europe. In all England and Wales in 1921 there were 63 murders,

and in 1922 there were 17 murders in London; the number of murders in France in 1919 was 585. In New York City alone there were 260 murders in 1921, and in Chicago 137; the estimated number of homicides in the whole United States in 1922 was 14,640. Of robberies, 95 were committed through England and Wales in 1921, and 121 in France. In 1922 New York City alone reported 1445 robberies; Chicago, 2417. The total number of persons in penal and correctional institutions in the country on July 1, 1922, according to the United States Census, was 163,884.

**PENSIONS.** See LABOR LEGISLATION; MOTHERS' PENSIONS; OLD AGE PENSIONS; SOCIAL INSURANCE.

**PEPPER, GEORGE WHARTON (1867- ).** An American legislator (see Vol. XVIII). In 1914 he participated in the movement for national preparedness. During the War he was chairman of the Pennsylvania Council of National Defense and in 1920-21 a member of the Commission on Constitutional Revision in Pennsylvania. In 1915 he was Lyman Beecher lecturer at Yale. Following the death of Senator Penrose he was appointed by the Governor of Pennsylvania to succeed him and held office until after the popular election in November, 1922, when he was elected by a plurality of more than 350,000 votes. In June, 1922, he was chosen a member of the Republican National Committee to succeed Senator Penrose. On taking his seat in the Senate he assumed a prominent place in the debates and work of that body.

**PERAK.** See MALAY STATES, FEDERATED.

**PERCEPTION.** The problem of perception has been the stumblingblock of scientific psychology ever since its inception. The reason for this is quite simple. Positive science has always been committed to the atomistic analysis and to the mechanistic explanation in general. In the physical sciences the perception of objects, i.e. the perception of unities over and above the conglomeration of atomic elements, was always taken for granted; but psychology, so far from avoiding this problem, attempted to deal with it by the orthodox method of atomic divisions. Metaphysically, the task was complicated by the relation of body and mind, or matter and consciousness. At the very outset of modern science the paradoxes of Descartes' mechanistic dualism had become apparent to every reflective thinker, and not even Leibnitz's ingenious hypothesis of preestablished harmony could bolster up the belief in a strict causal correspondence between physical and mental events. The psychological analysis of Locke, Berkeley, and Hume had later transformed the problem, and when nineteenth century psychology took the field, it had the great advantage over the Cartesians of coupling an improved physiological technique with a more refined method of psychological introspection. Withal, it was committed to psychophysical parallelism; and although this doctrine was discredited philosophically, it seemed to impose itself scientifically by the very necessities of experimentation.

The orthodox method of explaining perception was to split up the problem into sensation, image, memory association, and attention. The sensation was a unit element of psychological experience corresponding to a specific physical stimulus. As the sensation fades out of con-

sciousness, it becomes a potential image, for the stimulus leaves a residue in the nervous system which is capable of arousing a faint copy of the original sensation. Since each sensation leaves behind it a separate residuum, there is a vast number of such residua in memory, each of which may be separately aroused, thus allowing for a certain independence of the original arrangement in which the sensations were experienced. At this point the doctrine of association is invoked to provide an *ad hoc* explanation for the selection of certain memories on the occasion of a particular stimulus instead of any others. The doctrine of association dates back to Aristotle, and the reason for its long life is its ambiguous meaning, expressing as it does both a dynamic process and a static law of memory. According to the doctrine, sensations or images tend to call up memory images which are similar or which have once been experienced in spatial or temporal contiguity with the present sensations or images. All attempts on the part of modern psychologists to reduce similarity to spatio-temporal contiguity which could be measured quantitatively and statistically in the laboratory have failed. Now similarity of meaning in experience is not something that can be determined in advance, but *ex post facto* one may always say that a bond has become established between the old bit of experience and the new; in this case we are speaking of association as a dynamic process. It is questionable whether by this explanation we are really adding knowledge or whether we are not merely picturing the act of mnemonic imagination itself.

Similarity of meaning is thus seen to be the very nature of the associative process, for contiguity in time and space is but one of the lowest forms of this similarity and fortunately a form whose properties can be studied in advance of objective content. But for modern psychologists, as Koffka points out, meaning is itself explained by the working of associations which in themselves are meaningless. There is perhaps no better commentary on this attitude than the vast amount of experimental work which has been done on the memorization of nonsense syllables. This work was performed on the theory that one was getting at the fundamental conditions of memory, but actually all that was accomplished was the formulation of statistical and contingent laws for the memorization of specific nonsense syllables, more laws and more nonsense syllables than even the most modern theories of education will have need for in the next 1000 years. One may contrast with this type of experimentation the direct clinical methods invoked by the new psychology. So far from attempting to determine the conditions of memory and association along merely spatial and temporal lines, which must necessarily be limited at best to nonsense syllables, a psychiatrist like Jung attempts to determine concretely for a given person in a given situation the method behind that person's imagination. (See ASSOCIATION TESTS.) He does this by noting down the random associations, together with any expressions of emotion, which certain words call forth from a patient. The task here falls entirely on the psychiatrist, for there is no mechanical rule by which to measure the minds of all men; some general notions and a practical sympathy and skill on the part of the observer simply enable him to pic-

ture in his own mind the processes of his patient. It is, moreover, significant to point out the failure of the attempts made by Freud's disciples and by Freud himself to take the master's solution of specific dreams on the basis of certain symbolisms as scientific and all valid for all cases, instead of as suggestive examples to incite the use of one's creative imagination.

Turning now to attention, we find here the great scapegoat of experimental psychology. While every direct study of attention has sought to define it in terms of the stimulus and the physiological process, yet in experiments on perception it was treated as a mental element, as an unpredictable determining tendency which prevented the expected reaction from taking place. In short, so far from using a strict parallelistic procedure, experimental psychologists explained conscious phenomena in a physiological fashion whenever they could and then invoked mental concepts to explain discrepancies. Behind these mental concepts, such as attention, association, and memory, they indeed postulated corresponding physiological entities; but these were in no wise observable and amenable to scientific measurement. In Germany the school of the *Gestaltqualität* or form quality, following up Wundt's conception of creative synthesis, had given up the attempt to maintain psychophysical parallelism in the higher mental processes. They emphasized the fact, well-known in music and duplicated in other phases of psychological experience, of the form of a perception existing over and above the so-called objective content. Thus a melody has a real quality over and above the physical notes of which it is composed, since it may be transposed to totally different notes, provided the order and rhythm are maintained. On this theory all higher perceptual acts are instances of forms which have reality of their own, although they are ultimately "founded" on sensations with their psychophysical relationship of stimulus and consciousness.

Between the *Gestaltqualität* psychologists, such as Meinong, Ehrenfels, and Witasek, and their radical descendants, the school of *Gestalttheorie*, there may be traced an evolution almost identical with that which occurred in philosophy in the descent from Locke to Berkeley and Hume. Locke began with sensation produced by external substances, and with reflection which the mind contributed to the ordering of its external impressions. Berkeley and Hume found the Lockian conception of external substances completely useless inasmuch as these substances could not be known except through the "higher" faculties of reflection, which in the nature of the case are subjective. And so the final result of the current of criticism which Locke started was the development of empirical or phenomenal idealism. In point of fact, what the *Gestalt* psychologists have done was to apply experimentally the idealistic criticism to structural and physiological psychology. Only recently Dr. J. S. Haldane, the eminent Oxford biologist, had publicly declared that although he was a physiologist he "could not for a moment agree with the assumptions on which what is called physiological psychology is ordinarily based. These assumptions appear to me as a mixture of very rudimentary physiology with a psychology which has been obsolete since Hume and Kant.

It is doubtless the case that a very wide public is still ready to accept the assumptions in question, but a still wider public would accept the assumption that the sun goes around the earth." (*Proc. Aris. Soc.*, Sup. Vol. III, p. 65.)

Among the assumptions that Dr. Haldane had in mind is the constancy hypothesis, according to which a definite conscious sensation corresponds to every single stimulus. This assumption having been riddled experimentally by the proponents of form-quality, it remained for the more radical psychologists to show that the whole notion of an objective physical or physiological stimulus is quite misleading. They did this by reinterpreting in a new fashion the standard experiments with changing figures and perceptions of movement. In his laboratory studies of visual movement, Wertheimer showed how both the illusion and direction of movement could be obtained by preparing a pattern in the mind of the observer. Thus, if in the tachistoscope the experimenter exposes in succession two lines, first an oblique line making an acute angle with the horizontal, and then the horizontal itself, the observer will see the oblique line rotate in the direction of the horizontal, passing through the acute angle. Now if the experiment is repeated and the size of the angle is increased gradually until it passes a right angle and becomes an obtuse angle, the observer will still see the oblique line rotate in the original direction. If the experiment had been started with the oblique line making an obtuse angle, the illusion of rotation would have come about in the other direction, the illusion of movement being produced in the direction of the supplementary acute angle.

In the case of changing figures, which structural psychology had never been able to explain satisfactorily, even the subsequent distinction between form and objective content was valueless. Here there was no fixed physical content with a perceptual form superimposed, but rather there was an alternation of figure and ground, with the figure becoming the ground and the ground the figure when the meaning of the experience changed. Add to these experiments the investigations of Köhler on the perceptual experiences of animals, the last resort of old-time physiological psychology, and the foundation was laid for a new systematic approach to psychological experimentation. The question which Köhler set himself to answer was this: if an animal is confronted with two stimuli and is trained to react positively to the one and negatively to the other, what has it learned? According to traditional theory the animal has formed a connection between the one sensation corresponding to the first stimulus and the positive reaction, and likewise between the other sensation and the negative reaction. Köhler, however, introduced an experimental variation which tested this theory. He placed before the animal two stimuli, *b* and *c*, the one lighter and the other darker, with variations in their spatial arrangement. From *b* food could be taken but not from *c*. After a certain amount of training, the animal invariably chose the positive *b*. Then this pair of stimuli was replaced by another pair, *a* and *b*, with *a* lighter than *b*. The animal now reacted not to the stimulus *b*, as the older theory would suppose, but to *a* as the lighter stimulus. The conclusion was

inevitable that animals learned to perceive structures and forms rather than identical physicochemical stimuli. The same set of experiments was repeated in the case of fowls, chimpanzees, and a three-year-old child, and the results were the same; this showed that the principle was sufficiently fundamental to be continuous in the biological realm.

The theory of perception which the new school of *Gestalt* psychology has built up is that in the act of perception the entire configuration is cognized and not an isolated object. If we see a specific object, we see it in much the same way that we appreciate the subject of a tableau. The centre or focus of the picture is unintelligible without the background. Carrying this analysis further back, the theory holds that in every act of perception the general psychological state constitutes the field or screen and the external stimulus the picture on the screen. Field and object are thus relative to one another, but the relation of relativity, if we may so speak, is not constant and predetermined. For certain configurations one may alter the background within various limits and not change the perception of the object. Again, object and background are relatively interchangeable but not absolutely so. This interchangeability or reversibility reaches its maximum in the case of the angular drawings and changeable figures mentioned above, which may be seen facing either "inward" or "outward" at the will of the observer, provided his frame of mind has not been prepared. According to this theory the experimental psychology of perception has for its task the determining of specific relationships existing between so-called objective stimuli and the various frames of reference in which they happen to be put. In other words, experimental psychological analysis would be no different from analysis of the artist who steps back from his picture and tries to see it at the distance from which it would be seen in the salon. The picture, we may say, remains the same, but the perception of the picture, which is what actually counts, varies in accordance as it is seen at six inches or at three feet distance, in accordance as it is seen with the eye of a connoisseur or with the untutored eye of the man in the street.

The *Gestalt* school has produced a number of echoes from America. R. M. Ogden in numerous articles expounded a theory of meaning embracing the general view of the new psychology. But the mass of experiments on perception will probably continue to be interpreted from the methodological approach of introspective structuralism with its postulate of psychophysical parallelism. See **PSYCHOLOGY**, **GENERAL**.

**Bibliography.** For the theoretical discussion of the problem of perception, consult the article by Kurt Koffka, "Perception: an Introduction to the 'Gestalttheorie,'" together with the appended references, in the *Psychological Bulletin*, vol. xix, 1922, p. 531. For additional references on the experimental side of perception, consult the *American Journal of Psychology*, vols. xxxiii and xxxiv, particularly the articles of F. L. Dimmick, M. Zigler, L. W. Cobbey, A. H. Sullivan, E. Bershansky, L. Knight, and E. Shults.

**PERIODIC SYSTEM.** See **CHEMISTRY**.

**PERKINS, FRANCES** (1882- ). An American sociologist, born at Boston, and edu-

cated at Mt. Holyoke College, the University of Pennsylvania, and Columbia University. From 1907 to 1909 she was secretary to the Philadelphia Research and Protective Association, and from 1910 to 1912, executive secretary of the Consumers' League. She was director of investigations for the New York State Factory Commission in 1912-13 and executive director of the New York Council of Organizations for War Service from 1917 to 1919. In the latter year she became a commissioner of the New York State Industrial Commission. She was a member of many sociological and economic societies and wrote *Life Hazards from Fire in New York Factories* (1912); *The Problem of Mercantile Fire Hazards* (1914); *A Plan for Maternity Care* (1918); *Women as Employers* (1919); and *A Social Experiment under the Workmen's Compensation Jurisdiction* (1921).

**PERONNE.** See **WAR IN EUROPE**, *Western Front*.

**PERRY, RALPH BARTON** (1876- ). An American philosopher (see **VOL. XVIII**). After 1914 he concerned himself largely with practical and ethical problems. His books, *The Free Man and the Soldier* (1916) and *The Plattsburg Movement* (1921), deal with the problem of military preparedness in a democracy. *The Present Conflict of Ideals* (1918) is a companion volume to *Present Philosophical Tendencies*, and surveys the clash of consciences in the contemporary world. Professor Perry's other publications since 1914 include *An Annotated Bibliography of the Writings of William James* (1920) and numerous studies in American and French philosophical periodicals.

**PERSHING, JOHN JOSEPH** (1860- ). An American army officer, born in Linn County, Mo., and educated at the United States Military Academy. He served in the Apache Indian campaign in Arizona and New Mexico in 1886, in Cuba in 1898, and in the Philippines from 1899 to 1903. In 1905 he was with Kuroki's army in Manchuria. In 1916 he was appointed major-general. In 1917 President Wilson made him commander-in-chief of the American forces in France, and he conducted their operations in the War with conspicuous success. In 1915 the tragic loss of his wife and three daughters, who were burned to death in a fire during his absence, roused the sympathy of the country. He was appointed chief of staff of the United States Army in 1921 and retired on Sept. 12, 1924.

**PERSIA.** A monarchy of southwestern Asia extending north from the Persian Gulf and the Gulf of Oman to the Caspian Sea. Area, variously estimated at from 628,000 to 635,135 square miles; population, from 8,000,000 to 10,000,000. The population was polyglot, and being scattered in widely separated centres, was difficult of control. In the west, Kurds, Armenians, and Arabs were to be found; in the northeast, Turks from Russian Turkestan; along the shores of the Persian Gulf, Arab and Negroid elements. Nomads numbered about 3,000,000; Europeans, 1200, of whom 600 were British. Populations of the principal cities were estimated as: Teheran, the

capital, 220,000; Tabriz, 200,000; Isfahan, 80,000; Meshed, 70,000; Kerman, 70,000. About 90 per cent of the population were Mohammedans of the Shiah sect.

**Industry and Commerce.** The large desert areas and the dependence upon irrigation for the cultivation of crops accounted for the comparative unimportance, economically, of agriculture. Grain crops and rice were raised for local consumption, while fruits, tobacco, cotton, and opium were exported to some extent. The keeping of sheep and sericulture supported the native carpet and silk stuff establishments. Wool and prepared skins also entered into the foreign trade. Mineral resources were extensive and included oil, iron, coal, copper, lead, manganese, marble, nickel, and cobalt, though none was worked except oil. The Anglo-Persian Oil Company (controlled by the British government) held concessions covering all but five northern provinces and though the workings were as yet confined only to a single area, the wells yielded 2,959,000 tons in 1922-23 and 3,775,000 tons (estimated) in 1923-24. The indications were that the Persian oil fields were among the richest in the world. In December, 1923, it was reported that the American company, the Sinclair Consolidated Oil Corporation, had received concessions in four of the five northern provinces. Complete ratification was to depend, however, on the approval of the Persian Parliament as well as on the ability of the American group to raise a loan of \$10,000,000 for the government. The importance of oil in the economic life of the country may be gauged from the fact that while before the War its export was negligible and in 1915-16 was valued at only 21,758,000 krans (1 kran=9 cents), by 1922-23 the oil export totaled 429,000,000 krans, being nearly 60 per cent of the entire exports. Exports for 1913-14 were 455,839,635 krans; imports, 647,164,841 krans. For 1922-23 exports were 733,982,943 krans and imports 619,201,046. The changing emphasis in the economic life was indicated by the following comparative figures in articles exported for 1913-14 and 1922-23 (in thousands of krans): fruits, 70,000 and 34,000; carpets, 54,000 and 93,000; cotton, 85,000 and 17,000; rice, 42,000 and 13,000; opium, 38,000 and 41,000; skins, 12,000 and 10,000; petroleum, 17,000 and 429,000. Leading imports remained cotton tissues, sugar, tea, yarn. Up to 1917 the country was barely touched by the War but following that year it suffered severely. The presence of the demoralized Russian troops through 1917, the depredations of the Turk in Azerbaijan and the rich plains of the Urumiah, and the flight of the Assyrian Christians accounted for great losses. Drought and famine visited the country in 1917; the influenza took its toll in 1918. Flocks and herds fell off greatly and through the shortage of forage many beasts of burden were lost. The interruption of commerce with Russia visited great distress on all industries. Before the War, imports from Russia totaled 355,000,000 krans and exports to it, 300,000,000 krans; in 1922-23 imports were 73,446,237 krans and exports 62,122,678, showing considerable improvement over 1921-22. Great Britain, Egypt, and Mesopotamia had in the interim forged ahead so that by 1922-23 they were taking the great proportion of the Persian products and supplying as well most of the country's wants. In 1922-23

exports to the United States were about \$5,000,000; imports about \$500,000. These more than trebled the 1913 trade.

**Communications.** Internal transport was carried on by caravan. To 1914, only 6 miles of railway were in existence. In 1916, a Russian constructed railway from Julfa (Perso-Russian frontier) to Tabriz (85 miles) was opened; another line from Pirebazar to Resht, 7 miles long, was also opened; a military railroad in southern Persia, 52 miles long, was constructed from Bushir to Borazjan; the railroad from Quetta to Nushki, in India, was extended to Duzdab. The total railway mileage was 350 miles. Before the War, Great Britain and Russia had launched ambitious projects for the railway development of the country, but the collapse of Russia and the outbreak of the War made the realization of any programme impossible. But the dependence of the economic exploitation of the country upon a decent system of transport turned British capitalists once more to the railroad problem. A scheme for a line from Teheran to Kuraitu on the Persian frontier to connect with the Kuraitu-Bagdad line and thence with the whole Bagdad system was under consideration.

**Finance.** The latest available figures for revenues were those of 1912-13 which amounted to £1,055,792. The increase in revenues may be ascertained from the gross customs receipts (a little less than half the total receipts) which were £1,398,725 in 1920-21. In addition to the loans made before the War, the following foreign debts were contracted: British advances, 1912-14, £490,000; Russian advances, 1,891,500 rubles; British advances, 1915-17, £817,000; ditto, in krans, 1,000,000; ditto, 1918, in krans, 92,500,000; British loan of 1919, £2,000,000 (not advanced). By the treaty with Soviet Russia, of 1921, all Russian loans and advances were canceled. In 1920, a British financial adviser was appointed to the Persian government but he never actively functioned; in 1922, because of the increasing friendliness toward the United States, an American adviser was attached to the administration. The first year's activity, 1923, showed a balanced budget, an increase in revenues by a better control of assessment and collection, and a movement toward the revision of taxation. The 1924 budget estimate carried \$20,700,000 for revenue and \$20,661,500 for expenditure. The Russian Banque d'Escompte was, in March, 1921, handed over to the Persian government by the Soviet officials as a result of the understanding that had been effected.

**Army.** The refusal of Persia to ratify the Anglo-Persian agreement of 1919 which provided for a uniform military force under British officers caused the collapse of the military establishment. All British officers and men were withdrawn after 1921. It was fortunate, for internal security, that the American fiscal commission was able to put finances into a decent order and allow for the creation of an army; it was equally fortunate that Persia had at hand an administrator to construct an efficient machine almost overnight. Under Riza Khan, and aided by an appropriation of two-fifths of the annual income, an army, with tanks, airplanes, mobile artillery, and wireless, was created, which in three years was able to pacify the province of Khorassan, disband the followers of the bandit Kuchik Khan, and the

Kurd robbers on the west, and subdued the long defiant Sheik of Mohommeseh. Pacification and tax-collecting went hand in hand.

**History.** That Persian Azerbaijan should become a theatre of war was inevitable in spite of the declared neutrality of the government. Turks aided by the Kurds marched on Tabriz and took it in January, 1915, only to be driven out soon after by Russian forces. Urmia was the scene of severe fighting in 1915, the Christian inhabitants in particular suffering at the hands of Kurds and Turks. Meanwhile British forces, beginning operations to the southwest in Mesopotamia, pushed into Persia to defend the pipe lines running from the oil wells at Maidan-i-Naftun and here encountered tribesmen in sympathy with the Turks. The British were successful in expelling the hostile forces who fell back on Amara, thus leaving southwest Persia clear. In the west and north the struggle continued between the Turks and Russians. In 1916 the Turks had succeeded in dislodging the Russians from Kermanshah and Hamadan, which they held until the end of the year. In 1916, on the other hand, British operations became more aggressive. A column under Sir Percy Sykes marched from Bandar Abbas to Kerman, put an end to the German influence among the tribesmen, and then penetrated into the heart of Persia to Isfahan. Throughout 1917, Sir Percy Sykes worked effectively in the restoration of order in the province of Fars. Looting was stopped and the caravan routes opened. Early in 1917, the fall of Bagdad in Mesopotamia had rendered the Turkish position at Kermanshah a precarious one so that a retreat back to the frontier followed. The British now pushed north to effect a juncture with their Russian allies but the disintegration of the Russian forces after the Russian Revolution put an end to what seemed an easy triumph. The danger to India now seemed indeed real. The impossibility of dispatching a heavy military force to the northern Persian frontiers compelled the British to resort to political measures. A mission was sent into the north in 1918, its objective being Baku, but was compelled to stop at Enzeli on the Caspian Sea, and then soon after, to retire to Hamadan. In the autumn the mission, reinforced, held Baku for a time, but Turkish forces compelled it to fall back on Enzeli once more. Meanwhile a second mission, working its way from Afghanistan through the northeast, reached the Transcaspian province in Turkestan and united with the Mensheviks against Soviet Russia. However, southern Persia once more began to present a serious problem. In early 1918, the Kashgais tribesmen in force attacked Sir Percy Sykes's small column at Shiraz and for months the British position was a precarious one. The support of the Persian government and the preaching of a holy war for a time presaged the complete destruction of the British unit. But some sensational successes, and the gradual defection of the tribesmen, effected a triumph for Sir Percy Sykes and by October, 1918, the Kashgais were completely overthrown. The route from Bushire on the Persian Gulf to Shiraz was reopened by 1919.

The continual presence of the British in the country, with the threat of complete submergence now that the Russian hold had been broken, prompted Persian leaders to appeal their case to the Peace Conference. Their demands

included complete economic and political independence, territorial expansion, and reparation for the very heavy losses suffered at the hands of the warring nations. British intervention, however, prevented the presentation of these matters before the Conference so that the way lay clear for the Anglo-Persian Treaty of August, 1919. By the terms of this convention, the British government promised to respect the independence of Persia—with the following reservations: the British government was to supply expert advisers to the Persian government at the latter's expense; the British government was to furnish and equip a military force for the preservation of order in the country and on the frontiers; the British government was to grant a loan to be guaranteed by the customs revenues and other sources; railroads were to be built by British enterprise; the tariff was to be revised by Persian and British experts. The agreement never received ratification, however. The growing influence of Soviet Russia in Persia strengthened its irreconcilable temper. In May, 1920, Bolshevik forces occupied Enzeli and by the end of the year the greater part of the province of Gilan was under their influence. The growing movement against Great Britain finally forced the British evacuation of Kazvin early in 1921; the last remnants of British participation in internal affairs disappeared with the departure from the capital of the British controller of Persian finances and the disbanding of the South Persian Rifles (September, 1921). In March, 1921, a treaty between Russia and Persia was signed by which diplomatic rights were accorded to the former while the Russian loans and advances were completely canceled, Russian concessions were abrogated, and Russia's special rights in the northern zone under the Anglo-Russian agreement of 1907 were renounced, the Capitulations were terminated, and the Russian discount and land bank was turned over to the Persian government. Free from Anglo-Russian domination, Persia in 1921 again turned to the United States for unofficial assistance and obtained the services of an American, Mr. A. C. Millspaugh, as financial adviser; other American experts were secured to aid in sanitation. In 1923, boycotts were launched against British goods as well as imports via Mesopotamia. In this case anti-British sentiment was accentuated by a boundary dispute which opened old sores, for negotiations were begun regarding the revision of the former Turco-Persian frontier. In measure as the Persian leaders grew more antagonistic toward Great Britain, they displayed a definite orientation toward the United States. The success of Mr. Millspaugh in reorganizing Persian finances and the cordial coöperation of Persian authorities with American experts helped to strengthen this policy. Moreover, in the hope of securing ready capital, of which the country stood in desperate need, the government turned to American oil companies. There ensued a tortuous series of quasi-diplomatic oil negotiations. When, in 1921, the Standard Oil put forth claims to exclusive oil exploitation in the five northern provinces, the Anglo-Persian Oil Company countered by presenting concessions which had been obtained by a certain Russian, Khostaria, in 1896 and 1916, and sold by him to a subsidiary of the Anglo-Persian; but the latter was willing to compromise by sharing the northern field equally with the

Standard. The Persian Mejlist, however, discountenanced this amicable arrangement, and, in December, 1923, the Persian government made a preliminary contract with the Sinclair interests for oil exploitation in four of the northern provinces, on condition that the concessionaires advance \$10,000,000.

It was natural that the ferment of nationalism should begin to work soon in internal affairs. Young Persians, learning their lesson from Western methods, gained control of the government early in 1923 and agitated for a strengthening of the military establishment. Riza Khan, the leader of this movement, became prime minister on October 25, and with funds gained as a result of the fiscal reforms effected by the American controller, applied himself to reorganizing the army and establishing domestic tranquillity. Press reports early in 1924 indicated that the premier was fostering a republican agitation, inspired doubtless by the example of Nationalist Turkey; but so strong was the monarchist sentiment of the more conservative classes that Riza had to content himself with the deposition of the reigning but absentee Shah, and the succession of the latter's infant son to the throne.

**PERU.** A South American republic on the Pacific coast between Ecuador and Chile. No official census was taken after 1876, with the result that estimates must be unscientific in the extreme. An estimate in 1922 put the population at 4,620,000 (as compared with 2,597,604 in 1876), though any increase in population was questioned in many quarters. The boundaries in 1924 were not definitively settled, estimates placing the area at from 679,600 to 722,461 square miles. Lima, the capital, has a population of 173,000 and Callao, 52,000, according to a census of 1920; Arequipa was estimated to have a population of from 35,000 to 40,000.

**Industry and Trade.** Sugar, cotton and coffee continued to occupy the most important places in Peruvian agricultural life. Cotton culture in 1921 brought in 36,000 tons as compared with a crop of 26,170 tons in 1913. The values of cotton exported in the two years were: 1913, 1,424,000 Peruvian pounds; 1920, 11,190,061. In 1923, the value was 6,027,849 Peruvian pounds. The 1923-24 crop was greatly reduced by a severe drought. (The Peruvian pound equals the pound sterling at par. On Jan. 1, 1920, it stood at \$4.74; in 1921, it averaged \$3.64; in 1922, \$4.10; in 1923, \$4.135.) Sugar production in 1921 totaled 300,000 tons as compared with 192,754 tons in 1912. Sugar exports in 1913 were valued at 1,380,000 Peruvian pounds; in 1920, 15,584,888; in 1923, 6,266,209. Among the minerals, copper up to 1920 occupied the leading place, the 1920 output being 32,982 metric tons with a value of 2,358,243 Peruvian pounds. This showed a negligible gain over 1913 output. The production in 1922 was 36,408 tons. On the other hand, petroleum production in the decade 1914-24 forged steadily ahead so that by 1920 the value of the output exceeded that of copper. In 1905, the petroleum production was worth not much more than £125,000. In 1920, it reached £2,494,570 and in 1921, £3,618,955. In 1923, petroleum was exported to the value of £4,446,561. Other important industries included: silver, vanadium ore, wool, cacao, guano, coca, and the making of Panama hats.

Exports totaled \$165,929,441 in 1920, \$93,464,350 in 1922, and \$99,037,331 in 1923, as compared with \$45,871,504 in 1912. The leading imports were, in 1923, foodstuffs, cotton goods, metal goods, and machinery of all kinds. Imports for 1920 were valued at \$86,283,654, for 1922 at \$52,962,770, for 1923 at \$58,437,089 as compared with \$25,015,460 in 1912. The excess of exports over imports regularly mounted during the decade 1910-20, reaching the high figure of \$79,645,787 in 1920. In 1921, for the first time the trade record showed an unfavorable balance of \$42,520. In the period 1910-24, the United States forged ahead of Great Britain in Peru's commerce. The typical years shown in the table reveal the situation (in Peruvian pounds).

## VALUES IN PERUVIAN POUNDS

|           | Imports from<br>Great Britain | Imports from<br>United States |
|-----------|-------------------------------|-------------------------------|
| 1910..... | 1,676,543                     | 1,128,395                     |
| 1914..... | 1,598,605                     | 1,570,723                     |
| 1917..... | 1,934,665                     | 8,792,710                     |
| 1920..... | 2,694,195                     | 10,168,937                    |
| 1922..... | 2,024,903                     | 4,212,971                     |
|           | Exports to<br>Great Britain   | Exports to<br>United States   |
| 1910..... | 3,403,127                     | 2,032,510                     |
| 1914..... | 3,403,109                     | 3,033,259                     |
| 1917..... | 3,792,750                     | 10,942,407                    |
| 1920..... | 12,681,632                    | 16,265,092                    |
| 1922..... | 6,592,071                     | 6,582,712                     |

In 1913, the United States furnished 28.8 per cent of the imports and received 33.2 per cent of the exports of Peru. In 1923, that country furnished 40.4 per cent of Peru's imports and took 40.1 per cent of Peru's exports. Other countries took the following portion of Peruvian exports: Great Britain, 32.9 per cent; Chile, 8.7 per cent; Argentina, 3.6, and Germany, 3 per cent. Great Britain supplied 20.2 per cent of Peru's imports, Germany, 10.5, Italy, 4.2, and Argentina, 3.7 per cent.

**Communications.** In 1922, there were 1935 miles of railway in operation. This was a gain of 216 miles over 1912. The Peruvian merchant marine consisted of only 15 steamers of 14,248 tons. The trade of the country was carried in foreign bottoms, the nationality of the 575 ships calling at Callao in 1921 being: 179 British, 106 Chilean, 25 Japanese, 112 American. In March, 1921, the Marconi Company took over the management of the Peruvian postal, telegraph, and wireless services for 25 years. In 1920, there were 8817 miles of telegraph line, 723 post offices and 19 wireless stations.

**Finance.** In 1922, the revenues of the government amounted to £7,032,506 and expenditures to £8,083,183 (compare with the 1912 figures of £3,425,543 and £3,493,629). In 1913, the internal debt amounted to £3,792,855, and in 1921 to £4,641,290; the foreign debt in the two years was £1,162,700 and £934,840; the floating debt, £5,392,457 and £2,261,644. On Dec. 31, 1922, the total debt had increased to £11,125,093. This was due to two loans contracted in 1922: a petroleum loan of \$2,500,000 and a guano loan of £1,250,000. In 1922, also, a bill was passed authorizing a sanitation loan of \$25,000,000. In the same year an important step was taken for the stabilizing of business affairs in the creation of the Reserve Bank of Peru (Banco de Reserve

del Peru), a central bank of issue and discount.

**Government.** Up to 1920, internal affairs were the exclusive concern of the central government located at Lima, and provincial matters were handled through a corps of prefects and subprefects, responsible entirely to the president. The new constitution of Jan. 18, 1920, the result of a movement toward decentralization, provided for the installation of three regional congresses in the north, south, and centre, with considerable local autonomy. The president's term was increased to five years and he was made ineligible for a succeeding term. (This provision was amended in 1923 to permit one reelection.) The number of senators was fixed at 57; deputies at 128. An important step taken was the grant of absolute political and religious liberty, though Roman Catholicism was still retained as the state religion.

**History.** During the administration of Dr. José Pardo, 1915-19, Peruvian affairs centred, of course, on two main concerns; i.e. the War, and the country's economic status which was so much dependent upon foreign markets. In spite of sympathies for Germany which so many of the upper class entertained, the infectious democratic doctrine of President Wilson gained great popularity in Peru, with the result that diplomatic relations with Germany were broken in 1917. After a single year's depression, 1915, Peru rapidly adjusted itself to the war situation, its raw products being greatly sought after by the belligerents; so that by 1919 imports had doubled, and exports trebled the figures of 1913. Because of its favorable trade balance in 1917, Peru received \$13,505,068 in bullion from the United States. The disputed election of May 18, 1919, resulted in the seizure of President Pardo by adherents of Augusto B. Leguía and the installation of the latter, first, as provisional president, and then as regularly elected president. Under Sr. Leguía (1919-24) ambitious projects were set under way for the modernization of the country. The president, committed to an extension of the federal principle, promulgated the new constitution (above) and invited foreign countries, through expert commissions, to participate in Peru's reconstruction. An attempt was made to attract immigrants in 1919 by an offer of free transportation; the construction of the Ayacucho-Cuzo railway to put the capital in touch with southern Peru was pushed; and a movement was made to withdraw the paper notes issued during the War for the establishment of a stable currency. In 1921, negotiations were started with a British-Canadian company for the construction of some 1500 miles of railway in various parts of the country. In 1922, a programme for important irrigation works was projected to centre around the Cañete and Moche Rivers. An American sanitary expert, beginning with 1919, was given full powers to stamp out malaria and yellow fever, and in 1919, General Gorgas was requested to undertake the sanitation of Peru's important cities. The General's death temporarily checked the plan. The reorganization of the army during 1919-21 was placed in the hands of a French commission and the navy, in 1920, under an American commission with full powers. In 1921, several American educational experts went to Peru and one of their number was made director of instruction. Fi-

nally, the beginnings of a labor code were attempted in 1924 with the passage of laws for workmen's compensation and the arbitration of industrial disputes. Results of these progressive activities were at once evident. By 1922, foreign interest had increased so enormously that it was estimated British holdings totaled \$125,000,000, American \$90,000,000, Italian \$50,000,000 and German \$10,000,000.

In South American affairs, Peru's position was affected by its long outstanding controversy with Chile over the Tacna-Arica provinces. For the ramifications of this dispute see CHILE, BOLIVIA, TACNA-ARICA. The protocol signed by the disputants at Washington on July 15, 1922, to hasten the arbitration of the controversy was accepted in October by the Peruvian national congress, though by 1924 no settlement had yet been effected. Other boundary questions were settled more amicably; that with Bolivia in 1912, that with Colombia in 1922, and in the same year the Brazilian frontier.

**PESTS, INSECT.** See FORESTRY; HORTICULTURE.

**PETAIN, HENRI PHILIPPE** (1856- ). A French army officer, educated at the Ecole de Guerre. In 1914 he headed an army corps in masterly retreat from Charleroi to the Marne, and in 1916, in command at Verdun, he defeated the great effort of the Germans to capture it. He became commander-in-chief of the French forces on the western front, May 15, 1916; infused new life and spirit in his men, maintained close relations with his allies in the same field, and struck the Germans with great energy at Verdun in August and at Chemin des Dames in October. He was made marshal of France at the end of the war and also became vice president of the Conseil Supérieur de la Guerre. See WAR IN EUROPE.

**PETRIE, SIR WILLIAM MATTHEW FLINDERS** (1853- ). An English Egyptologist (see Vol. XVIII). He continued his excavations in Egypt till 1920. Among his later writings are: *Amulets* (1914); *Heliopolis* (1914); *Scarabs* (1917); *Tools and Weapons* (1917); *Eastern Exploration* (1919); *Some Sources of Human History* (1919); *Prehistoric Egypt* (1920); *Social Life in Ancient Egypt* (1923). See ARCHÆOLOGY.

**PETROLEUM.** In the ten-year interval from 1914 to 1924 few industries had experienced so great a development as that having to do with the production, refining, and utilization of petroleum. In 1913 the world's total production amounted to 385,347,000 barrels of 42 United States gallons, but by 1923 this had increased to 1,010,995,000 barrels, of which the United States produced 735,000,000, or 73 per cent of the total output of the world. The unprecedented demand for petroleum was due in great measure to the widespread use of the internal-combustion engine, especially as employed in motor vehicles. Along with this increased demand had come improved processes in refining as well as the exploitation and development of new fields. Outside of the United States, Mexico was the greatest producer, supplying, in 1923, 149,472,000 barrels, though in 1921 it had achieved a record of 203,521,000 barrels. From 1913 to 1923 Rumania had dropped from 13,554,000 barrels to 10,930,000, and Russia from 62,834,000 to 38,167,000. Persia on the other hand had increased from 1,857,000 to 27,300,000, the Dutch East Indies

from 11,172,000 to 15,000,000, Peru from 2,133,000 to 6,375,000, and Argentina from 130,000 to 3,330,000 barrels.

At the end of 1913 the total assets of the American petroleum industry were \$1,136,718,000. At the close of 1921 they had increased to \$6,383,632,000, and at the end of 1923 the total assets were estimated in excess of \$9,000,000,000. In the 10 years from 1914 to 1924 the petroleum industry in the United States had attracted new capital to an amount between \$2,500,000,000 and \$3,000,000,000 which was used in the opening of new fields, for such purposes as drilling, pipe lines, and storage, not to mention the erection and equipment of numerous refineries.

In the decade under review one of the most important influences on the American petroleum industry was the great increase in the number of automotive vehicles. (See MOTOR VEHICLES.) On Jan. 1, 1914, there were in operation in the United States 1,250,000 automobiles, which, by the close of 1923, had increased to more than 15,250,000, or a gain of 1100 per cent, while so far as the refineries were concerned the increase in the amount of crude oil to run them was but 176 per cent. In 1913 the average consumption per day in the United States averaged approximately 573,000 barrels, as compared with 1,592,000 barrels in 1923. The improvement in technical processes, and in particular the evolution and development of the cracking processes, brought a yield of 12.5 per cent of naphtha from the crude oil in 1913, up to nearly 31 per cent in 1923.

**Important American Oil Fields.** The years 1914-24 saw the development of many important fields in the United States, especially in California, Oklahoma, and Texas. Previously the most important fields under production had been the Sunset Midway in California, which was developed in 1900 and at the close of 1913 produced 140,000 barrels daily; Healdton, in Oklahoma, which came in early in 1912 and was producing 40,000 barrels; and the famous Cushing Pool in Oklahoma, which was producing in excess of 180,000 barrels, reaching its maximum in 1915 with 310,000 barrels. The Salt Creek oil field in Wyoming had been opened up in 1912, when it produced less than 20,000 barrels daily. Another important field developed in this period was the Santa Fé near Los Angeles, in California. It established a record of 340,000 barrels per day. Then Powell, Texas, brought into production in the latter part of 1921, and destined to be the world's largest producing field, produced a maximum of 315,000 barrels in the middle of 1923, but this declined in a few weeks to 145,000 barrels. In 1915 both Augusta and Eldorado, Kan., were important fields which came into production, and in 1917 the Burkburnett, Texas, oil fields were added. In 1917 came the Ranger oil field, also in Texas, and in 1918 and 1919 there followed West Columbia, Hull, and Desdemona, all in Texas; Hewitt, in Oklahoma; and Homer, in Louisiana.

The famous Huntington Beach field in California began production in 1919 and by 1923 had increased its output to 115,000 barrels. In 1920 Burbank, Okla., an important mid-continental field, was brought in. Two other fields of that year were Eldorado, Ark., and Haynesville, La., together with Long Beach, Cal., Mexico, Texas, and Tonkawa, Okla. Another field developed early in 1922 was Smackover in Ar-

kansas. In 10 years the American petroleum industry had developed 23 active pools of major importance, of which all but two reached a maximum and then fell back to a position of secondary importance. The important petroleum fields in California contributed materially to the increasing production of the United States, but it was the opinion of geologists that the maximum production in California would soon be reached, as at the end of 1923 all the fields except three had passed their peak; and although new fields might be discovered and developed, it was thought that the final decline would be rapid when it came.

**Mexican Production.** In Mexico, the development of oil had begun only since 1901, with the first shipments taking place about 1904. In 1913 the total production had reached 25,696,000 barrels, of which 21,330,868 were exported. By 1921 it amounted to 193,398,000 barrels, from which it had declined to an output of about 150,000,000 barrels in 1923. This extraordinary decline seemed to indicate that the production of several of the producing areas in Mexico was at an end and that another source of bunker fuel oil must be looked for.

**Persian Oil Fields.** An even more rapid development has taken place in Persia, where petroleum on a commercial basis was not produced much earlier than 1913, when 1,758,000 barrels were produced. By 1923 this output had increased to approximately 27,300,000 barrels, and there were in operation pipe lines for delivering the oil to Abadan, at the head of the Persian Gulf, whence tank steamers carried the crude oil to the refinery of the Anglo-Persian Oil Company at Suez, which supplied the market of the Near East. Crude petroleum was also loaded on tankers for shipment to Europe, and during the year ending July 31, 1922, a total of 69 tankers carried 607,248 tons of crude oil in bulk, passing northward to the Suez Canal and bound from the Persian Gulf ports for Swansea in Wales, where the Anglo-Persian Oil Company had constructed and completed in 1922 a refining plant, one of the largest in the world outside of the United States and Mexico. With this plant and with other refining works contemplated in England, this company, which enjoyed the support of the British government would soon, it was believed, be in a position to take care of the demand for petroleum products throughout the British Isles.

The wells of this company are in the Maidani-Naftun district, about 50 miles northeast of Ahruz on the Karun River, and in 1922 they produced in excess of 50,000 tons a month. In addition to these fields, which lie in southeastern Persia, there are important other fields in northern and eastern Persia for which the Anglo-Persian Company in 1923 were applicants for concessions, as were also the Standard Oil Company of New Jersey and the Sinclair Consolidated Oil Corporation. The Persian government objected to additional grants to the Anglo-Persian Company on the ground that further influence in Persian affairs was not altogether wholesome, and accordingly the concessions at the end of 1923 for the absolute control and development of oil deposits of four of the northern provinces of Persia was awarded to the Sinclair Consolidated Oil Corporation. The government retained one of the northern provinces for its own purposes. Naturally such rich oil fields attracted the large

oil corporations, and their respective governments were active in their behalf. See PERSIA.

**South American Petroleum.** In South America there had been developments in several of the states, and the large world oil companies were looking for concessions wherever conditions were promising. In Peru the production in 1923 was estimated at 5,508,985 barrels, an increase from 2,071,000 in 1913, and oil concessions were sought in the departments of Amazonas, San Martin, Loreto, and Pinra. In Colombia a law of Jan. 31, 1923, made more liberal land-leasing regulations, and numerous American companies were seeking concessions. After Peru, the leading South American source of production was Venezuela, which had developed rapidly up to some 4,000,000 barrels, and the Argentine Republic, where out of an estimated production of 3,200,000 gallons, the government reserve at Comodoro Rivadavia, which first became an important producer in 1914 with 275,131 barrels, contributed some 2,343,000 in 1923. The government owned and operated a fleet of five tankers with a capacity of more than 27,000 tons of oil, which transported the oil from the port of Comodoro Rivadavia, 1000 miles south of Buenos Aires, to that city, and to Rosario, Sante Fé, Bahia Blanca, or other cities where storage facilities are maintained.

**Transportation of Oil.** That the American oil industry is highly organized is particularly evident in connection with the transportation. At the very outset there were required pipe lines, which take the oil from the wells and carry it to the refineries where it is treated. From a total mileage of a little less than 40,000 at the close of 1913, the American pipe lines had increased to approximately 75,000 miles at the close of 1923. This figure represented all the pipe lines employed by gathering and transporting companies engaged in the business of carrying oil. The main oil pipes alone aggregated in excess of 34,000 miles. These pipe line companies must either build into a new field or extend their existing lines to take care of the new production. In 1923 about 2,000,000 barrels of crude oil were gathered and transported for producing purposes every 24 hours; if moved in tank cars, this amount would have required at least 10,000 such carriers on sidings adjacent to the fields every day in the year. Of course a certain number of tank cars are employed to move the crude oil or the subsequent products, and in 1921 approximately 137,500 tank cars were so employed in the United States and Canada for this purpose.

**Marine Transportation.** As California increased its crude oil production, it developed storage and bunkering facilities at Los Angeles harbor. It was found that oil could be shipped from Californian ports by tank vessels through the Panama Canal eastward cheaper than the pipe line charges from the mid-Continent fields to the same destination. Likewise it could compete with oil brought to the Atlantic coast of the United States from Mexico, notwithstanding the fact that each shipment involved a round trip of approximately 10,000 miles. As the distance was so much greater, more than twice the tonnage necessary to transport the same amount of oil from Mexico to the Atlantic coast refineries must be employed in this traffic. Nevertheless in 1923 tank steamers

made a total of 1704 transits through the Canal and constituted about 34 per cent of the total number of ships passing through the Canal during the year. These vessels paid an aggregate of nearly \$9,000,000 in tolls, or 39 per cent of the total annual revenues. Their movement, both ways, aggregated 9,625,714 tons of cargo, 38 per cent of the total shipment through the Panama Canal. A modern tank vessel can now be loaded at the rate of 25,000 barrels per hour and discharged at a rate of 10,000 barrels per hour, or 6 and 14 hours respectively for a tanker of 140,000 barrels capacity. The use of these tankers has not been exclusively to transport oil from the oil fields to refineries but also for the use of oil-burning ships, which have increased materially in numbers and capacity in the merchant marine, not to mention the various navies. In 1913, out of a total world's merchant tonnage of 24,444, 23,779 burned coal. In 1923, out of 29,246 vessels 24,380 burned coal and 4866 burned oil, or an increase in oil-burning tonnage of 1030 per cent as against the two per cent increase in coal-burning tonnage. It was estimated that the fuel consumed by such vessels in 1913 was less than 3,000,000 tons, whereas for 1923 it was over 23,000,000 tons, or an increase of 710 per cent, while the consumption of coal for steamship bunkers increased to 3 per cent. See INTERNAL-COMBUSTION ENGINES.

**Increase in American Refining Capacity.** In 1913 the total consumption of crude oil in the refineries in the United States amounted to 573,000 barrels. Ten years later this figure had risen to 1,587,000 barrels, and from this amount nearly 150,000,000 50-gallon barrels of naphtha, or nearly 31 per cent of the crude oil handled, were obtained, whereas in 1913 a volume of about 22,000,000 50-gallon barrels, or 12.5 per cent naphtha, was obtained from the crude oil distilled. The chief reason for this large increase was the development of the cracking process, designed to secure the largest possible amount of naphtha, as previous to 1913 the crude oil treatment was mainly with the object of producing illuminating oil. With the production of naphtha limited to the natural naphtha content of the crude oil, and the small percentage secured through cracking or decomposition of the heavier applications in the ordinary fractionated still, in order to secure a greater output of gasoline and in view of the fact that there was no adequate outlet for the production of the other products, a pressure still was developed by Dr. W. N. Burton of the Standard Oil Company, in which "cracking" could be carried on in an efficient manner, so that in 1922 about 25 per cent of the total gasoline production of the United States was obtained through cracking at pressures above that of the atmosphere.

In 1923 there were something like 2000 pressure cracking units of various designs in operation, with an estimated production capacity of 45,000,000 50-gallon barrels of naphtha a year, about twice the total production of naphtha in 1913. The annual production of naphtha would be divided approximately somewhat as follows: 132,000,000 barrels of crude oil in refinery operations, 22,000,000 barrels recovered from natural and casinghead gas, and 40,000,000 barrels in cracking operations at or above atmospheric pressures. The demand for gasoline with the increased number of motor vehicles, tractors,

airplanes, motor boats, etc., led to the development of various means to provide gasoline in addition to those mentioned. In the first place it was found possible to remove the light volatile naphtha from natural gas and then at the crude oil wells at so-called casinghead plants, where absorption by compression methods was used to save the light naphtha, and finally a combination of these last two methods. This work was developed so that where once it was hardly possible to handle the volatile naphtha on account of evaporation loss, and it was permitted to go back into the gas system for burning as fuel, there were derived in 1923 about 22,000,000 42-gallon barrels by these methods. (See NATURAL GAS.) Another method of extracting gasoline was to treat the noncombustible gases in the refinery operations, where the gas had been previously burned as fuel, and then the development of cracking methods where pressures up to 350 pounds or more were employed, where, as in the case of the Standard Oil Company of New Jersey's processes, it was found possible to crack the whole range of petroleum products from refining distillate to the heavy fuel residues of the crude oil itself.

**Oil Production.** Reference has been made to the increase in the amount of gasoline products and the decline in the amount of illuminating oil. This is also shown in the export statistics of the United States, where, in the year 1913, there was a total of 40,751,416 50-gallon barrels of crude oil and products exported, of which 23,388,825 barrels were illuminating oil and 3,760,867 barrels were gasoline, in addition to which there were over 7,000,000 barrels of gas oil and fuel oil. During the War, when some 90,000,000 barrels of oil were used in the fighting area, of which at least 95 per cent was American oil, the export figures of course were abnormal, but up to the year 1923 the total exports had reached 79,743,740 barrels, an increase of 96 per cent over the 10 years previous. At this latter point the exports of illuminating oil (kerosene) were about 17,000,000 barrels, or but three-fourths of what they were in 1913, while the exports of gasoline, naphtha, and other oil products amounted to nearly 17,000,000 barrels, or a 350 per cent increase, and the exports of gas oil and fuel oil amounted to 24,571,880 barrels, or a 242 per cent increase.

**Fuel Oil.** By 1913 the Mexican crude oil, the production of which in that year amounted to 25,696,000 barrels, not only became available in quantity but with the increased output could be used for fuel oil for steamship bunkers. This led to the extensive use of fuel oil in the shipping industry of the world and also for boiler furnaces. The method of treating the Mexican oil is to top the lighter crude oil for naphtha, retaining perhaps 85 per cent of the crude for fuel oil, while in the case of the heavier Mexican crude oil it has been topped merely to give the necessary flash test. In 1914 the gas and fuel oil business of the United States amounted to 74,681,000 50-gallon barrels, while in 1923 the United States Bureau of Mines recorded its business as having increased to 241,483,834 barrels. In connection with the Mexican crude oil it was possible to derive a number of asphalt products used for roofing, street paving, and other purposes. This asphalt business, which in 1914 was 465,000 tons, in 1923 had increased to 2,373,000 tons. See ASPHALT.

**Public Aspects of the Industry in the United States.** It has already been suggested that the great demand for petroleum and petroleum products which developed in the 10 years following 1914 led to many national and international political developments. It was realized that the supply of oil was variable and that many sources would be exhausted in comparatively short periods, even with appropriate conservation measures. In the United States in particular, the rapid exhaustion of the oil lands was regarded as a national question. On Sept. 27, 1909, President Taft, in response to the general demand for conservation, withdrew 3,000,000 acres of public lands in California and Wyoming from "location" under the Placer Mining Law, especially to meet the future needs of the government, of which quite important was the matter of oil fuel for naval vessels. It was also realized that fuel oil was an important asset and necessary for the operation of a fleet with modern engines. To conserve an adequate supply for the future, President Taft on Sept. 2, 1912, created Naval Oil Reserve No. 1, at Elk Hills, Cal., to contain 38,969 acres, and followed it on December 3 of the same year with Reserve No. 2, near Buena Vista Hills, Cal., containing 29,341 acres. It was considered desirable that further national oil reserves should be established, and on Apr. 30, 1915, President Wilson created Reserve No. 3, near Casper, Wyo., containing 9481 acres, which then and afterward was popularly known as "Teapot Dome." In the shale oil regions in Utah Reserves No. 4 and No. 5 were established.

After the conclusion of the War the administration of the naval oil reserves was turned over by Secretary of the Navy Denby to Secretary of the Interior A. B. Fall in spite of the protest of several naval officers. From this time on, the oil reserves became a matter of considerable interest and figured extensively in political developments in the United States. This was due principally to the fact that Secretary Fall leased Naval Reserve No. 3 (Teapot Dome) to H. F. Sinclair, the head of the Sinclair Oil Company, who turned it over to the Mammoth Oil Company in exchange for \$106,000,000 worth of stock. This was early in April, 1922, and in April, 1923, the Doheny interests included under the direction of Edward L. Doheny, head of the Mexican Petroleum Corporation, received a preferential right to lease Naval Reserve No. 1 under a contract to perform certain work for the United States Navy at Pearl Harbor, in the Pacific, where a naval base was located and where oil supplies were considered of strategic and practical importance.

Toward the end of the year 1923 the Senate Public Lands Committee engaged in an investigation of the entire subject, which by this time had developed into a considerable scandal, involving former Secretary Fall, who had retired from the cabinet in March, 1923. A subcommittee of the Senate continued the investigation, which brought out considerable sensational testimony but much difference of opinion as to the advisability of making the leases in view of surrounding circumstances. This committee submitted a report which criticized the leases and the part played by several officers of the government, and these leases were canceled and a commission appointed to investigate the en-

tire matter. It was unfortunate that the essential facts were obscured in the political aspect of the situation, and by the middle of 1924 the actual merits of the matter had not been determined outside of the laxity of certain government officials.

During the War there was a great demand for petroleum and petroleum products, but the post-war peace requirements for oil were considerably in excess of the war demands. In 1923 the oil wells of the United States produced one-tenth of all the oil hitherto forthcoming in the country up to 1924, and in that year it was estimated by petroleum geologists that the original supply of the United States was more than 40 per cent exhausted.

**Bibliography.** The frequent reports of the United States Geological Survey and of the United States Bureau of Mines, also the annual issues of *The Mineral Industry*, afford considerable information, particularly on the statistics of the petroleum industry. From time to time the American Petroleum Institute in New York also publishes valuable bulletins and technical papers presented at its annual meetings. A most complete and useful work is *Handbook of the Petroleum Industry*, 2 vols., D. T. Day, editor (New York, 1922). Other recent volumes of value are V. R. Garfias, *Petroleum Resources of the World* (New York, 1923); L. C. Uren, *Petroleum Production Engineering* (New York, 1924); J. M. Macfarlane, *Fishes, The Source of Petroleum* (New York, 1923); Dorsey Hager, *Practical Oil Geology* (New York, 1919); id., *Oil Field Practice* (New York, 1921); R. H. Johnson, L. G. Huntley, and R. E. Sommers, *The Business of Oil Production* (New York, 1922); J. E. Pogue, *The Economics of Petroleum* (New York, 1921); Victor Ziegler, *Popular Oil Geology*, 2d ed., (New York, 1920); United States Geological Survey, *World Atlas of Commercial Geology*, Part I, *Distribution of Mineral Production* (Washington, 1921); United States Bureau of Standards, *National Standard Petroleum Oil Tables*, Circular No. 154 (Washington, 1924). See MEXICO; MESOPOTAMIA; CHESTER CONCESSION; SAKHALIN; SHIPBUILDING, *Oil Fuel*; CHEMISTRY, ORGANIC; GEOLOGY.

**PETROVA, OLGA** (1886- ). An actress born in Warsaw, Poland, and educated at Paris, Brussels, and London. She began her theatrical career at the age of 20 in Shakespearean productions and later appeared in plays of Ibsen, Bernstein, and Strindberg. After making her American stage debut in New York City in 1911, she gave some time to motion pictures and appeared in *The Daughter of Destiny*; *The Orchid Lady*; *Bridges Burned*, and *More Truth than Poetry*, written by herself. She herself wrote *The White Peacock* and *The Hurricane* in which she starred.

**PETRUNKEVITCH, ALEXANDER** (1875- ). A Russian-American zoölogist, born at Pliski in Russia, and educated at the University of Moscow and at Freiburg. He was lecturer in zoölogy at Harvard (1903-04); acting professor (1906) at the University of Indiana; honorary curator of arachnida at the American Museum of Natural History (1909-11); and professor of zoölogy (1918- ) at Yale. He published: *Gedanken über Vererbung* (1903); *Free Will* (1905); *Index Catalogue of Spiders of North Central and South America* (1911); *Terrestrial Palaeozoic Arach-*

*nida of North America* (1913); and *Morphology of Invertebrate Types* (1916).

**PETZOLD, JOSEPH** (1862- ). A German university professor (see VOL. XVIII). He contributed numerous articles to philosophic journals on the physical theory of Einstein as viewed from the standpoint of positive relativism. He also published a volume on *Biologische Grundlagen des Strafenrechts* (1920).

**PHASE RULE.** See CHEMISTRY, PHYSICAL.

**PHELPS, ALBERT CHARLES** (1873- ). An American architect and educator, born at Lockport, Ill., and educated at the University of Illinois and in Germany. In 1899 he was appointed instructor in the College of Architecture of Cornell University and was successively assistant professor, professor, and World War Memorial Professor of architecture (1920) there. He contributed to architectural journals and lectured at the Metropolitan Museum of Art.

**PHILADELPHIA.** The third city of the United States. The population rose from 1,549,008 in 1910 to 1,823,779 in 1920 and to 1,922,788 by estimate of the Bureau of the Census for 1923. Much was done between 1914 and 1924 to improve the port. In 1915 the two Southwark piers were completed by the city as the first units of a scheme to give the city a municipally owned water front of more than a mile. The complete development of the plan involved a series of piers, each with a railroad track down the centre connecting with the belt lines on Delaware Avenue, giving access to all the industries along the river. It was expected to cost \$24,000,000. The Delaware River was dredged to the sea to a depth of 35 feet. The Navy Department in 1916 began a concrete drydock 1064 by 212 feet, capable of holding any American vessel. During the War the shipyards at Hog Island received orders from the Shipping Board for 120 vessels of 7500 tons and 60 vessels of 8800 tons capacity. Congress appropriated \$62,000,000 for the yards, and 50 shipways were laid down and put to work.

The municipal government was reorganized in 1920. A small council of 21 members replaced the old bicameral council of 144, the budget system was adopted, model civil service reforms were introduced, including provision for a civil service commission of three persons, and the prohibition of any political activities by firemen or policemen. A city purchasing agent and a city architect were appointed, and radical changes made affecting city contracts.

The city-planning commission submitted a zoning plan dividing the city into residential, commercial, industrial and unrestricted use districts, five height districts, and five area districts. Eleven miles of elevated railroad were built during the ten years, from the Market Street elevated north and northeast, roughly parallel with the course of the Delaware River. It was made to be as noiseless as possible, the steel supports being partly filled with concrete to minimize their vibration, and the rails laid in a roadbed of broken stone. The cars also were specially constructed for silence. In 1918 a \$6,000,000 bond issue was voted for a new subway system which was to run north and south under Broad Street, crossing beneath the older subway at City Hall. Before a great deal of work had been done, however, the increasing costs caused by war-time conditions forced postponement of construction. In 1923

it was decided to take up the work once more. Construction was to begin at once on the four track subway under Broad Street from Olney Avenue to Spruce Street, and on the two track subways under Ridge Avenue, Eighth Street, Walnut and Chestnut Streets, and the elevated roadway to the southwest and Darby. The whole work was estimated to cost approximately \$90,000,000.

Work was begun in 1921 on a suspension bridge over the Delaware River from Philadelphia to Camden. It was to have a central span 1750 feet long, surpassing all previous suspension bridges by 150 feet, and was to be 3536 feet from anchorage to anchorage, and 8126 feet long including the approaches. For a distance of 800 feet the bridge cleared high water by 135 feet. The total cost of the bridge, which was to be borne by the two States of Pennsylvania and New Jersey, and by the two cities of Camden and Philadelphia, was estimated at \$22,479,000; and the cost of the real estate which must be bought was \$5,392,000. It was hoped to have the work completed by July 4, 1926, when the city planned to celebrate the 150th anniversary of the signing of the Declaration of Independence. A bascule bridge over the Schuylkill was built by the city under the direction of the Bureau of Surveys and opened in 1923. See RAPID TRANSIT.

**PHILIPPINES.** The largest island group of the Malay archipelago, a possession of the United States since 1899. The population of the Philippines increased from 7,635,426 in 1903 to 10,314,310 in 1918. The estimated population in 1922 was 10,768,323. The population per square mile was 67 in 1903 and 90 in 1918. The population designated as Christian numbered 6,987,686 in 1903 and 9,381,357 in 1918. The non-Christian population, 647,740 and 932,953. The population in 1903 as regards sex included 3,496,652 males and 3,491,034 females; in 1918, there were 5,177,568 males and 5,136,742 females. By races: the brown race numbered 6,914,880 in 1903, 9,386,826 in 1918; the yellow race 42,097 in 1903, 50,826 in 1918; the white race 14,271 in 1903, 12,390 in 1918; the Negro race 1019 in 1903, 7623 in 1918. In 1903, 6,931,548 persons had attained Filipino citizenship and in 1918 this number had increased to 9,428,291. By religions, there were 6,559,998 Roman Catholics in 1903, and 7,790,937 in 1918. The Protestants in 1918 numbered 124,575; the Mohammedans 443,038; Pagans, 508,596; Buddhists, 24,263, and all others, 5454. There are no earlier figures for these last classifications. The largest cities, with their populations, are as follows: Manila, 219,938 in 1903, 285,306 in 1918; Cebu, 31,079 in 1903, 65,502 in 1918; Albay, 14,049 in 1903, 52,756 in 1918; Iloilo, 19,054 in 1903, 49,114 in 1918; Lepa, 37,934 in 1903, 46,577 in 1918; San Carlos, 9974 in 1903, 42,453 in 1918. Other cities having a population of over 35,000 in 1918 are Batangas, Argao, Laoag, Ormoc, and Cagayan.

**Mineral Production.** The islands of the Philippines have important mineral resources. Deposits of gold, coal, petroleum, quicksilver, copper and platinum exist, especially in the department of Mindanao and Sulu. What apparently was one of the largest available unexploited iron deposits in the world is located on the Pacific coast in the Province of Surigao and extends from tidewater to the interior, perhaps

to the adjacent province of Agusan. In the decade 1913-23, the Bureau of Science did valuable work in the examination of mineral resources in the islands, and there was a considerable development in mining during that period. In 1915, seven companies were operating mines; this increased in 1918 to eleven; it fell, in 1919 to two, and in 1920 to three. The chief activity during this period was in the examination of oil and coal fields. In 1920, American drillers began boring for oil on the Bondoc peninsula. The production of gold was 1,937,941 fine grams in 1918; 1,970,651 in 1919; 1,920,753 in 1920; and 1,976,096 in 1921. The silver production was 123,974 fine grams in 1918; 261,558 in 1919; 307,343 in 1920; and 814,621 in 1921. These are the only metallic metals of importance mined in the islands. Of the non-metallic, the chief products are coal, lime, mineral waters, salt, sand and gravel, and stone. The coal production in 1918 was 15,663 metric tons; in 1919, 32,892; in 1920, 58,088, and in 1921, 39,445. The production of lime in 1918 was 15,000 metric tons; in 1919, 20,000; in 1920, 3000; and in 1921, 3500. The total value of mineral products in 1918 was 3,915,095 pesos; in 1919, 4,622,241; in 1920, 5,126,711; and in 1921, 3,520,520.

**Agriculture.** In the decade 1913-23, as in the previous years of American administration, vigorous and unremitting efforts were made to encourage and extend agriculture, which is the principal source of welfare of the islands and the chief occupation of the people. The results accomplished were nothing short of remarkable. They were brought about by improving communications on land and sea; lowering freight rates; furnishing expert professional advice; encouraging the building up of agricultural schools; urging the youths of the country to devote themselves to agriculture; by continued efforts to eradicate epidemic diseases among horses, cattle and carabaos; by vigorous campaigns against locusts; by the enactment of health legislation, and in various other ways. During the decade the Department of Agriculture also encouraged the raising of poultry and the breeding of hogs, cattle and other animals with a view to increasing the food supply. It encourages the breeding of carabaos, cattle and horses for work purposes. Under the supervision of the Bureau a very careful study was made, with a view to prevention and control of rinder pest, a disease which every year carries off many thousands of carabaos. Rigorous regulations were applied against the importation of cattle from countries affected with rinder pest and other cattle diseases and a rigid quarantine was constantly maintained. The agricultural crops are often affected by drought and other disadvantageous conditions. Following the successful rice crop of 1913, the crop of 1914 was damaged by a great drought, which resulted in a decrease of 25 per cent in the production. The substitution of corn as a food product made considerable headway during the decade. The crop for 1914 was 6,265,746 cabans, an increase of 44 per cent over the preceding year. The production of corn was 309,799 metric tons in 1918; 332,636 in 1919; 431,268 in 1920; 402,714 in 1921; and 375,362 in 1922. The most important crop in the islands is rice. The area under cultivation increased from 1,244,937 hectares in 1914 to 1,661,430 hectares in 1922. The production increased from 977,682,959 kilos in 1914 to 1,124,000,000 kilos in 1922. The value of

the product increased from 57,261,760 pesos in 1914 to 139,935,080 pesos in 1922. Second in point of value of the product is sugar cane. The area cultivated increased from 169,436 hectares in 1914 to 240,820 hectares in 1922. The value of the sugar cane increased from 28,631,545 pesos in 1914 to 59,948,250 pesos in 1922. Third in importance is coconuts: the production increased from 591,266,399 nuts in 1914 to 1,467,684,000 in 1922, while the value increased from 25,651,764 pesos in 1921 to 55,267,680 in 1922. The production of abaca, or manila hemp, which is an important industry, decreased from 137,635,563 kilos, valued at 29,968,009 pesos in 1914 to 121,046,019, valued at 19,918,860, in 1922. The tobacco industry showed a decrease also; in 1914, there were produced 46,731,463 kilos valued at 7,109,367 pesos, and in 1922, 29,927,000 kilos valued at 6,019,870 pesos. The production of coffee, on the other hand, increased during the decade. The production in 1914 was 626,408 kilos valued at 302,771 pesos, which increased to 1,149,000 valued at 822,800. The production of cacao increased from 565,802 kilos in 1914 with a value of 354,057 pesos, to 984,000 kilos with a value of 1,148,100 pesos in 1922. The total area of land cultivated under the nine principal crops in 1917 was 2,721,182 hectares, out of a total area of 29,625,974 hectares. This had increased in 1919 to 3,005,322 hectares. The total area of cultivated farms increased from 1,298,845 hectares in 1903 to 2,415,778 hectares in 1918. The total area of farms, including cultivated and uncultivated, increased from 2,827,704 hectares in 1903 to 4,563,723 in 1918. The average size of the cultivated farms decreased from 159.3 hectares in 1903 to 123.6 in 1918.

The progress of the live stock industry in the islands is indicated by the statistics in the

|                      | 1913      | 1916      | 1918      | 1920      |
|----------------------|-----------|-----------|-----------|-----------|
| Cattle .....         | 418,114   | 567,456   | 601,297   | 760,920   |
| Carabaos ..          | 1,047,164 | 1,228,836 | 1,338,082 | 1,464,285 |
| Horses and mules ... | 179,089   | 203,364   | 234,041   | 268,999   |
| Goats .....          | 529,180   | 661,859   | 751,077   | 821,661   |
| Sheep .....          | 104,147   | 142,091   | 165,686   | 195,705   |
| Hogs .....           | 2,086,736 | 2,734,803 | 2,894,403 | 3,369,183 |

table. It may be noted that in 1916 the cattle and carabaos killed by rinder pest numbered 18,251; in 1918, 15,747; in 1920, 16,911 and in 1922, 34,306. In spite of the difficulties encountered, gratifying progress was made in the production of crops in the Philippines, especially in the last three years of the decade. In 1920 there was a production far in advance of any previous annual period. In 1917 the aggregate value of six leading crops was 241,000,000 pesos; in 1918 it advanced to 350,000,000 pesos; in 1919 to 458,000,000 pesos and in 1920 to 687,000,000. While much of this increase in the money value was due to prevailing high prices, there was an increase in the acreage under cultivation and in the yield. In 1920, less rice was imported than in the previous year and the production came nearest to meeting the demand for home consumption. Corn also showed an increase in acreage and in value. The veterinary division of the Department of Agriculture and Natural Resources performs valuable services by inoculating cattle against rinder pest with an anti-rinder pest serum. During 1920, over 10,000 animals were immunized by inoculation. Sev-

eral experiment stations are maintained in the islands as well as breeding stations for horses, cattle, swine and poultry. The Plant Industry Division exercises supervision over plant and seed selection, tests fertilizers and conducts exploration and investigation into various subjects connected with plant industry. In 1922, 12 stations and 17 projects were maintained.

**Manufactures.** While the manufacturing development in the Philippines has not kept pace with agricultural and commercial development, there has been considerable progress, as is indicated by the fact that the number of establishments increased from 3259 in 1903 to 8354 in 1918; wage earners increased in number from 79,906 in 1903 to 143,465 in 1918; capital invested increased from 53,159,580 pesos in 1903 to 22,473,592 in 1918; and value of the products increased from 41,700,215 pesos in 1903 to 356,094,433 in 1918, while the value added by manufacture increased from 16,650,763 pesos in 1903 to 195,217,279 in 1918. The manufacture of sugar is the most important industry. Its rapid development may be shown by the fact that the value of the product in 1903 was 6,603,006 pesos and in 1918, 82,145,962 pesos. Oil works rank second in value of product, and had a remarkably rapid development, increasing from a value of 302,032 pesos in 1903 to 59,722,483 in 1918. Rice mills increased the value of their product from 1,010,965 pesos in 1903 to 43,462,805 in 1918. The abaca or hemp-pressing industry is also important; the value of the products in 1918 were 44,844,566 pesos. There were no comparative figures for 1903 as this industry had not then developed. The product of cigar and cigarette factories increased from 8,740,516 pesos in 1903 to 26,623,275 in 1918. Other important industries are lumber mills, rope factories, tailor shops, boatbuilding, lithography, printing and bookbinding. The manufacture of coconut oil and copra is of great increasing importance. In 1922, there were produced 366,808,888 kilos of copra and 2,656,813 kilos of coconut oil.

**Transportation.** The length of the railway lines in the islands increased in the island of Luzon, from 883.60 kilometers in 1913 to 1,039.14 in 1922. In Cebu and Panay the mileage remained stationary at 212 kilometers in the two periods. The total passenger and freight revenue in the lines of Luzon, which includes the city of Manila, increased from 4,878,767 pesos in 1913 to 11,033,400 in 1922. In the city of Manila, there were about 80 miles of electric railways which carried over 36,000,000 persons annually. The number of automobiles in the islands increased greatly; in 1922 there were about 10,000, and nearly 3000 automobile trucks. The mileage of telephone wire increased from 9123 kilometers in 1918 to 10,360 in 1922. There were, in 1922, about 36,000 kilometers of telephone wire.

**Education.** The development of education in the islands has been one of the chief concerns of the government since the establishment of American rule, and the efforts have been extraordinarily successful. From the establishment of the Bureau of Education in 1900, a great public school system has been developed in the islands. This achievement has been made possible only through persistent struggles against adverse conditions. Buildings and equipment had to be renewed and teachers had to be trained. The people in general had to be

educated to appreciate the value of the public schools and their interest in them and their readiness to support them is in distinct contrast to the apathy which existed at the time the system was founded. Their change of attitude is an indication of an intellectual awakening which scarcely finds a parallel in history. At the time the Bureau was established, there were over 1,000,000 children of school age in the islands and it was the aim of the bureau to bring 800,000 of these into the public schools at the earliest possible date. In 1913-14, the annual enrollment for the school year was 621,000. This had increased in 1921-22 to 1,077,342. The average monthly enrollment in the latter year was 975,092, and the average daily attendance was 909,947. The problem of teachers was a very serious one; at first a large portion of the instructors in the schools were American, but the training of Filipino teachers at the Philippine Normal School, the Philippine School of Arts and Trades, the provincial secondary schools, the intermediate schools, and the University of the Philippines resulted in a large proportion of well-trained native teachers. The number of male American teachers decreased from 268 in 1917-18 to 134 in 1921-22, while the male Filipino teachers increased from 8421 to 14,417. The number of female American teachers increased from 138 in 1917-18 to 231 in 1921-22; Filipino female teachers in 1917-18 numbered 4400 and 9253 in 1921-22.

Special forms of education, such as physical, agricultural and industrial instruction were successful from the beginning. In 1920, there were over 250 agricultural schools; 15 of these were classed as agricultural schools, 14 as farm schools and 222 as settlement farm schools. The famous Central Luzon Agricultural School at Munoz is said to be the best institution of its kind in the Orient. Improvement in the quality and quantity of the industrial work done in the public schools was steady. In 1919-20, the school children produced industrial articles worth over 1,300,000 pesos. Records attained by students of the public schools of the Philippines in the carnival interscholastic games and Far Eastern meets show conclusively that physical education also was receiving the closest attention. Instruction in civics, hygiene and sanitation is given in the first six grades of the public schools. The spread of education among the non-Christian tribes has been a difficult problem. The purpose of the Bureau of Education has been to bring these people to the same cultural level of their Christian brethren and at the same time to strengthen the bond of union between them and their Christian kinsmen. To bring about this result, a large number of Christian Filipino teachers were assigned during the decade 1913-23 to these provinces. In 1920, there were 1728 of these teachers. In addition to the public schools there were many private schools in the island. These, in 1921-22, numbered 525, with a total enrollment of 64,835, over double the enrollment of 1913. The total expenditures for public schools in 1922 was 16,382,348 pesos, compared with 6,262,778 pesos in 1913. In 1921-22, there were in the islands 371 public vocational schools. Of these 338 were schools of agriculture; 23 were trade schools and 7 were normal schools. The University of the Philippines at Manila steadily increased in influence and importance. It is composed of the Colleges of Agriculture,

Education, Engineering, Liberal Arts, Law, Medicine and Surgery, Veterinary Science, Junior College of Liberal Arts, and Schools of Dentistry and Pharmacy. Also connected with the university is the Conservatory of Music, School of Fine Arts, School of Forestry, School of Nursing, and University High School. The total attendance in 1921-22 was 4063 compared with an enrollment of 1398 in 1913.

**Finance.** Financial conditions in the islands suffered in the decade 1913-23 from the disturbances created in general by the War and also by local conditions. The Philippine National Bank, the largest financial institution in the island (see *Banking*, below), suffered during 1920 as a result of an extension of its loans for the development of the industrial and commercial resources of the islands. This had an unfavorable result on the finances of the Territory. The general progress of financial administration during the decade will be noted from the fact that the receipts for the fiscal year 1913 amounted to 26,979,400.64 pesos and the expenditures to 29,608,082.54 pesos. In 1920, the receipts amounted to 90,905,779.72 pesos and the expenditures to 75,511,145.73 pesos. There was a surplus at the end of the year of 15,394,633.99 pesos. In 1922, the receipts of the insular government amounted to 130,649,853 and the expenditures to 78,911,424, leaving a surplus of 51,738,430 pesos. The bonded indebtedness of the islands in 1913 was 32,250,000 pesos, and in 1922 was 149,420,000 pesos.

**Trade and Commerce.** The development of trade and commerce in the islands during the decade 1913-23 is shown by a comparison of figures for several years of the decade. The total foreign trade in 1913 amounted to 202,171,484 pesos, of which 106,625,572 were imports and 95,545,912 exports. The total trade had increased by 1918 to 467,587,387 pesos, of which 270,388,964 were exports and 197,198,423 imports. In 1920, the total trade exceeded 600,000,000 pesos, but owing to adverse conditions in the two years following, it fell, in 1922, to 351,561,885 pesos, of which 191,166,526 were exports and 160,395,289 were imports. The total trade of the United States in 1922 amounted to 223,699,852 pesos, compared with 86,220,558 in 1913. The exports in 1922 to the United States amounted to 128,223,201 pesos and the imports from the United States to 95,476,651 pesos. The most important articles exported from the islands are copra, sugar, hemp, tobacco and oils. The leading articles imported are cotton and its manufactures, agricultural implements, iron and steel, and oils. The domestic commerce in 1922 amounted to 981,782,066 pesos, compared with 661,640,304 pesos in 1914.

**Health and Sanitation.** Perhaps the greatest problem faced by the American government in the Philippines was the spreading of ideas of modern sanitation among the people. For the most part the average Filipino is born, lives and dies without medical attendance or nursing. There is also great lack of hospitals and dispensaries. Although great progress was made in sanitation during the decade 1913-23, especially during the first years of the period, there was a steady increase in recent years in the number of preventable diseases, especially typhoid, malaria, beri-beri, and tuberculosis. Epidemics of cholera and other diseases were frequent. The death rate per 1000 in the is-

lands was 16,817 in 1913; 18,553 in 1914; 35,467 in 1918; 19,385 in 1921. As a result of intensive general vaccination, smallpox almost entirely disappeared from the islands. Cholera, however, continued more or less prevalent. There was an outbreak of considerable intensity in 1916. Typhoid fever caused many deaths, and systematic anti-typhoid vaccination carried on by the health service contributed much to the gradual diminution of this disease. An active educational campaign was carried on through the decade by public conferences, lectures, administrations, pamphlets and other measures. Leprosy, which is common in the islands, was greatly reduced by the administration of various esters of chaulmoogra. A leper colony is maintained at Culion, where about 500 persons receive this treatment annually. Much excellent work was done by missionary societies during the decade in the establishment of hospitals and dispensaries. The Rockefeller Foundation also contributed money and personnel with excellent results. A school for sanitary inspectors was conducted, which included a six months' intensive training course for the nurses.

**Banking.** The resources of the banks in the Philippines increased from 63,745,929 pesos in 1913 to 431,405,077 in 1920. In 1922, they amounted to 326,203,461 pesos. The Filipino National Bank was established in 1916 and by law was made the depository of all provincial and municipal governments. All government funds were transferred from other banks to this bank. As the result of inefficient management, the bank suffered a series of losses in 1920 which reached a total of \$22,500,000. The American government, becoming alarmed at the situation, secured the services of an experienced banker from the United States under whose guidance the bank was placed on a sounder footing. A large part of the assets, however, had been loaned to concerns which for many years will be unable to repay them. These were chiefly sugar centrals and coconut-oil factories. The bank also established branches and agencies throughout the islands in charge of which were placed untrained Filipinos, and these branches, without exception, were mismanaged. These losses seriously involved the Philippine government and its credit was severely impaired by the fact that it was not able to meet its obligations.

**Government.** The insular government is divided into the legislative, executive and judicial branches. At the head of the executive branch, since the passage of the Organic Act of 1916, is the governor-general, who is appointed by the President, by and with the advice and consent of the Senate. He is assisted in the performance of his duties by the department secretaries. All these, with the exception of the secretary of public instruction, who is also vice governor-general and is appointed by the President, were Filipinos in 1924. These officers are appointed by the governor-general. The other officials of the government, appointed by the President, are the auditor, and the deputy auditor, and the nine justices of the Supreme Court. As regards provincial government, the Philippines are divided into 48 provinces, 36 of which are known as regularly organized provinces and the remaining 12 as specially organized provinces. The chief executive of a province is the provincial governor,

who in a regularly organized province is an elected official. He, together with the other two elected members, forms the provincial board which constitutes the legislative branch of the provincial government. In some of the specially organized provinces, the provincial governors are elected and any other appointive officials. There are in the Philippines 890 municipalities. The executive of a municipality is called a municipal president. The municipal council, which is the legislative branch of the municipal government, consists of from 8 to 19 councilors, depending on the size of the municipality. The Legislature is made up of the Senate and the House of Representatives. Of the 24 senators only two are appointed by the governor-general. All the others are elected by popular vote. The 93 representatives are also elected, with the exception of nine, who are appointed.

**Judiciary.** The administration of justice is entrusted to the Supreme Court, in the courts of first instance, the municipal court of the city of Manila, and the courts of justices of the peace. The Supreme Court is made up of nine justices, one of whom is chief justice. Decisions of the Supreme Court may be appealed to the United States Supreme Court in certain cases.

**Political Events.** The decade 1913-23 included some of the most important events since the American occupation. It was marked by the passage by Congress, in 1916, of an Organic Act which established the form of government for the islands. From 1913 to 1916, the period was marked by political changes which had a marked influence on the later political history of the Territory. From 1907 to 1913, under the influence of the Philippine Commission, many constructive measures were passed and special emphasis was placed upon the improvement of education and the construction of permanent improvements. From 1913 to 1916, the restraining influence of the Commission was withdrawn by the appointment of a majority of Filipinos in that body.

In September, 1913, Francis Burton Harrison was appointed Governor-General of the Islands of the Philippines, succeeding W. Cameron Forbes. In conformity with his previously announced policy, President Wilson nominated a majority of the Filipinos as members of the Commission. Since the membership of the lower house of the Philippine Assembly was already composed entirely of elected Filipinos, this placed the majority vote of the Filipino legislation in the hands of the Filipino people. The Legislature in 1914 passed many important measures, especially relating to finances. Governor Harrison carried on the policies of the Federal administration by appointment of an increasing number of Filipino heads of the executive branches of the government. During 1914 there occurred the so-called Ricarte movement. A man of this name, from a refuge in Hongkong, attempted to create an uprising among the more ignorant classes of persons in Manila and elsewhere. This was quelled without serious trouble. In 1915, the greater part of the legislative sessions was devoted to consideration of financial reform and the economic development of the islands. During this year there were practically no disturbances requiring the attention of the constabulary in any part of the islands. The year 1916 was signalized by

the passage in Congress of a new Organic Act which was approved by President Wilson on Aug. 29, 1916, and which did away with the Philippine Commission and established a governor-general as the executive head. It established the executive, legislative and judiciary departments as described in the paragraph *Government* above.

The first session of the Philippine Legislature created by the bill convened in Manila on Oct. 16, 1916. For the first time in the history of the islands, the non-Christian tribes were represented in the legislative branch of the government.

Congress, in 1917, passed no measures directly affecting the Philippines. The Immigration Act passed in that year applied to the islands but only until superseded by an act of the Philippine Legislature on the subject. The first election for senators in the Philippines was held in October, 1916, and at the meeting of the Legislature on October 16 of that year, the Philippine Commission ceased to exist. The session of the Legislature held in 1917 created a new budget system which was approved by the President. A currency act provided for the reduction of the bullion value of Philippine coins when circumstances required, and made other provisions in relation to the currency.

The year 1919 was one of political activity and economic disturbance in the islands, as a result of conditions brought about by the end of the War. The statements of the Allied leaders during and after the War in regard to the rights and liberties of small nationalities had been widespread in the Philippines and led to a demand on the part of a strong political element for immediate independence. Immediately after the signing of the Armistice, the Filipino Legislature appointed a commission to the United States ostensibly for the purpose of establishing improved economic relations, but before its departure for the United States the commission was instructed to present the case for immediate independence. The agitation for independence, while it continued in 1920, was less strenuously advocated. By 1920, all the branches of the government, except the Supreme Court, had been Filipinized. Following the election of President Harding in 1921, Governor-General Harrison resigned and was succeeded on October 15 of that year by General Leonard Wood, who, with W. Cameron Forbes, formerly governor-general, had been appointed as a special commissioner to the Philippines to examine the political and economic conditions. The Commission arrived in Manila on May 4, 1921, and at once undertook a general survey into the government and conditions of the islands. Following General Wood's service as chairman of the Commission, he was appointed, in October, 1921, governor-general of the islands. General Wood and Mr. Forbes, in their report on the work of the Commission, recommended that the present general status of the Philippines continue until the people have had time to absorb and thoroughly master the power already in their hands. They recommended also that the governor-general have authority commensurate with the responsibilities of his position. The report concluded as follows: "We recommend that under no circumstances should the American government permit to be established in the Philippine Islands a situation which will

leave the United States in a position of responsibility without authority."

At the very outset of his administration, Governor Wood found himself bitterly opposed by the aggressive advocates of independence. Controversy over appointments and other details of administration in 1922 resulted in a demand on the part of political leaders for Governor Wood's recall. He was, however, upheld in all his acts by President Harding. The Legislature of 1921 and 1922 provided for the issuance of bonds in the amount of \$5,000,000 for the purpose of protecting the financial interests of the government. Two parties, the Collectivista or coalition party, headed by Manuel Quezon and Señor Osmena, the two most powerful politicians in the islands, and the so-called Democratic party, were the most important political organizations in the islands. The Collectivistas carried on, from 1921 to 1924, an aggressive campaign for independence and against the administration of General Wood. The Democratic party took the more moderate position. While it stood for independence, it assailed the leaders of the other party as grossly corrupt and charged them with misapplication of funds. In February, 1923, the Legislature chose Isaura Gabaldon and Pedro Guevara resident commissioners in Washington. The Collectivistas refused to cooperate with Governor-General Wood in the work of the legislation. The Philippine Independence Commission, in November, 1923, appointed Manuel Roxas speaker of the Insular House of Representatives, commissioner to visit Washington and explain the Filipino side in the controversies with the governor-general. A resolution was introduced in Congress, in December, for an investigation of the administration of General Wood in the Philippines. The resolution failed of passage. The Filipino Independence Commission, in January, 1924, presented to Congress a memorial denouncing the administration of General Wood and asking for the immediate independence of the islands. In March, 1924, Señor Roxas presented the arguments for independence to President Coolidge, who replied in a letter reviewing the Philippine situation and declaring that "Although they have made wonderful advances in the last quarter of a century, the Filipino people are by no means equipped, either in wealth or experience, to undertake the heavy burden which would be imposed upon them with political independence. Their position in the world is such that without American protection there would be the unrestricted temptation to maintain a costly diplomatic service and an ineffective but costly military and naval service." He said also "The Government of the United States has full confidence in the ability, good intentions, fairness and sincerity of the present Governor-General. It is convinced that he has intended to act, and has acted within the scope of his proper and constitutional authority." The Insular Affairs Committee of the House of Representatives, in March, 1924, voted the report granting independence to the islands. This was afterwards modified to provide for such independence in 25 years. No action was taken on this resolution prior to the adjournment of Congress in June, 1924.

**PHILLIPS, CHARLES** (1880- ). An American poet and playwright, born at New Richmond, Wis., and educated there and in

Toronto. He had much experience as an editor, and during the War served overseas. Among his best books are: *Back Home—An Old-Fashioned Poem* (5th ed., 1913); *The Divine Friend*, a poetic drama produced by Margaret Anglin in 1915; *Tarcisus*, a drama (1917); *A Buccaneer of Christ* (1918); *A Saint for Soldiers* (1918); *The New Poland* (London, 1923); *The Teachers' Year* (1924).

**PHILLIPS, WILLIAM** (1878– ). An American diplomat, born at Beverley, Mass., and educated at Johns Hopkins University and the Harvard Law School. He was private secretary to the Ambassador to Great Britain from 1903 to 1905 and served in various capacities in the State Department until 1908. He was appointed chief of the division of Far Eastern affairs and then became First Secretary of the American Embassy in London. He served again in the State Department and from 1917 to 1920 was Assistant Secretary of State. From the latter year to 1922 he was minister to the Netherlands and was appointed Under-Secretary of State in 1922. In 1924 he was appointed Minister to Belgium.

**PHILOLOGY, CLASSICAL.** The 10 years dating from Aug. 1, 1914, were trying years for one who sought to survey the wide field of classical philology. The War in Europe, 1914–18, interrupted the publication of periodicals and books, especially the former. Even in 1924, conditions in the book trade abroad were still unbalanced. It was hard to find out what was being published abroad, and still harder to obtain copies of books.

Inevitably, therefore, in the present article the major emphasis is laid on the work of American classical scholars. Further, it is possible only to discuss certain marked movements and tendencies, and to name a few of the more important books. The books named will be, for the most part, selections from the extensive lists given in the *New International Year Books* 1914–23.

In *The Nation* (New York), May 11, 1911, Prof. Paul Shorey, of the University of Chicago, in a paper entitled "American Scholarship" (reprinted in *The Classical Weekly*, vol. iv., pp. 226–230), supplied adequate proof that American classical scholarship need not fear comparison with the classical scholarship of Germany, or England. At the semicentennial of the American Philological Association, in December, 1919, Professor Shorey returned to the subject, in a paper entitled "Fifty Years of Classical Studies in America." At the same meeting, Prof. F. G. Moore, of Columbia University, traced the history of the American Philological Association, and Prof. M. Bloomfield, of the Johns Hopkins University, considered "Fifty Years of Comparative Philology in America." For these three papers see *Transactions of the American Philological Association* (vol. 1, pp. 5–83).

In the decade, American classical scholarship suffered grievous losses through the deaths of the following scholars (the name of the university with which the scholar was connected at the zenith of his career is given in parenthesis): Frank Frost Abbott (Princeton), Charles E. Bennett (Cornell), John M. Burnam (Cincinnati), Basil Lanneau Gildersleeve (Johns Hopkins), Thomas D. Goodell (Yale), Tracy Peck (Yale), Bernadotte Perrin (Yale), Samuel Ball Platner (Western Reserve), Moses S. Slaughter (Wisconsin), Kirby Flower Smith

(Johns Hopkins), James Rignall Wheeler (Columbia), and John Williams White (Harvard).

Professor Gildersleeve, whose death occurred on Jan. 9, 1924, was for 40 years editor of the *American Journal of Philology*. In the *Year Book* for 1921, p. 553, reference was made to the fact that vol. xl, No. 4, of that journal appeared on Oct. 3, 1921, the ninetieth anniversary of the birth of Professor Gildersleeve, and that the whole volume was dedicated to him. The number mentioned contains an "Index Scoliodromicus," of 13 pages, which lists Professor Gildersleeve's extrasyntactical contributions to the *American Journal of Philology*, and supplements the "Indiculus Syntacticus," published in the same periodical (vol. xxxvi, 1917), a bibliography of Professor Gildersleeve's long array of very valuable notes, published in the *American Journal of Philology*, in the sphere of syntax.

One of the most interesting developments during the decade was to be seen in the efforts made, especially in England, America, and Germany, to bring a knowledge of the contents of the classical authors, and of their value, to a wider array of readers. Of prime importance here is the Loeb Classical Library, whose aim is to present all the more important classical authors, Greek and Latin, with the ancient text on one page and an English translation on the opposite page. For general observations on the Library see *The Classical Weekly* (vol. v, pp. 126–127; vol. vi, pp. 82–86, 127); for detailed discussions (by C. Knapp) of various volumes of the Library see *The Classical Weekly* (vol. vii, p. 192; vol. xii, pp. 49–50, 57–58, 65–66; vol. xiii, pp. 145–147, 153–154, 161–162, 169–170; vol. xv, pp. 187–190, 197–199; vol. xvi, pp. 185–186, 193–195; vol. xvii, pp. 169–170, 177–178, 185–186).

Another important movement in this field is represented by the series of volumes entitled *Our Debt to Greece and Rome*, published under the general editorship of Prof. G. D. Hadzits, of the University of Pennsylvania, and Prof. D. M. Robinson, of The Johns Hopkins University. For the plan and the scope of the series, see the *New International Year Books* for 1922 and 1923.

In Germany, the series of volumes whose purpose is to popularize the classics is entitled *Das Erbe der Alten*. More pronouncedly scholarly, but still of interest to the general reader, are such works as *Einleitung in die Altertumswissenschaft*, under the general editorship of A. Gercke and E. Norden; *Die Hellenische Kultur*, and *Die Hellenistische-Römische Kultur*, both edited by F. Baumgarten, F. Poland, and R. Wagner and *Die Griechische und Lateinische Literatur und Sprache*.

A very important work in classical philology in the decade was the establishment of two new series of classical texts. Germany had long had an authoritative series of texts of the classical authors, both Greek and Latin—the famous Teubner Series. By 1924, the Oxford University Press had, in the course of 30 years, in the Oxford Classical Text Series, presented a fair array of texts of authors, Greek and Latin, edited by competent scholars, in most cases English. During the War, Messrs. Paravia and Company, Italian publishers, began a series entitled *Corpus Scriptorum Classicorum Paravianum* (see *The Classical Weekly*, vol. xi,

p. 200, xv, 135-136; *Year Book* for 1918, p. 493). The *Corpus Paravianum* was to show the manuscript text, with emendation only where the manuscript tradition gives no sense; otherwise, conjectural alterations proposed or accepted in other editions were not even to be mentioned.

About 1917 or 1918, French scholars began the publication of a series of texts of authors, Greek and Latin, under the patronage of the Association Guillaume Budé, which derives its name from Guillaume Budé, the great humanist of the French Renaissance, the founder of the Collège de France. In each instance, the text, with a brief critical apparatus, and a translation, in French, were to be given. There were published editions (with translations) of parts of Plato, Aeschylus, Sophocles, Pindar, Aristotle, Aristophanes, Cicero, Seneca, Tacitus, as well as complete editions of Lucretius, Persius, Juvenal, Catullus, and Petronius. Under the head of literary and historical studies, the Association published also a *Histoire de la Littérature Latine Chrétienne*, by P. De Labriolle, and of *Sénèque Proseur, Études Littéraires et Grammaticales sur la Prose de Sénèque le Philosophe*, M. A. Bourguery.

In Germany certain monumental works had long been under way, before 1914, whose aim was to make accessible what was known (or conjectured) in various fields of classical philology. The most ambitious efforts of this sort were the *Handbuch der Classischen Altertumswissenschaft*, and the classical encyclopædia known by the abbreviation "Pauly-Wissowa."

The *Handbuch* was begun under the editorship of Iwan von Müller. After 1922, a thorough revision, under the direction of W. Otto, in progress. In the 50 years that had elapsed from the time the publication of the *Handbuch* was begun, the horizon of the classical scholar had been greatly widened, particularly through the discoveries connected with the so-called Minoan civilization. This extension of knowledge took scholars back several millennia of the point at which, five or six decades previously, classical civilization was supposed to begin. Scholars had gained, also, a far better understanding of the relation of the historic classical civilization to the civilization that preceded it, in the Mediterranean Basin, on the European side, in Egypt, and in Asia. Hence, in the revision of the *Handbuch* new topics were being included, such as "Grundriss der Politischen Geschichte des Alten Orients," and "Kulturgeschichte des Alten Orients," to each of which a volume was to be devoted. The title of the *Handbuch*, in view of this wider range of its subjects, was altered to *Handbuch der Altertumswissenschaft*.

Pauly's *Real-Encyclopädie der Klassischen Altertumswissenschaft* was begun as long ago as 1830. A revision was undertaken, in 1890, by G. Wissowa; the first part of this appeared in 1894. The work, in 1924, was under the direction of W. Kroll and W. Witte. Between 1913 and 1924, four enormous volumes, carrying the first part of the encyclopædia forward from "Helikon" to "Kynegoi," were published. To facilitate the progress of the work, what was called a "Zweite Reihe" was begun in 1920. Two volumes of this, covering the articles "Ra" to "Sila," had been issued (1920, 1921). In 1918 appeared also *Supplementband III*, dealing

with "Aachen" to "Ad Iuglandem"; *Supplementband IV* was issued in 1924.

Another great German undertaking, *Ausführliches Lexikon der Griechischen und Römischen Mythologie*, begun by W. H. Roscher, with the coöperation of many scholars, was virtually complete. The great *Thesaurus Linguae Latinae*, the most comprehensive and authoritative of all Latin lexicons, made some progress during the decade. In France, the *Grand Dictionnaire des Antiquités Grecques et Romaines*, by Daremberg and Saglio, was completed during the decade.

A significant movement in the United States was the attention paid to the classical element in English literature. Important studies here were *The Relation of Latin and English as Living Languages in England During the Age of Milton*, W. P. Myers; *The Influence of Horace on the Chief English Poets of the Nineteenth Century*, Mary R. Thayer; *Horace in the English Literature of the Eighteenth Century*, Caroline Goad; *Vergil and the English Poets*, Elizabeth Nitchie; *The Classical Mythology in Milton's English Poems*, C. G. Osgood; *Classical Mythology in Shakespeare*, R. K. Root; *Ovid and the Renaissance in Spain*, R. Schevill (1913); *The Traditions of European Literature from Homer to Dante*, Barrett Wendell. For discussions of these works, see *The Classical Weekly* (vol. xii, pp. 171-173, 177-179, 185-188; vol. xiv, pp. 25-29; vol. xvi, pp. 13-16).

During the 10 years, increasing attention was paid to the papyri discovered from time to time, especially in Egypt. These were studied in part for the light they throw on works of classical writers already known, by giving recensions of the ancient text hundreds of years older, in some instances, than the earliest manuscripts. They were examined also for additions to the store of classical texts. Illustrations of the profits of such study are to be seen, for example, in the volumes of *Oxyrhynchus Papyri*, edited by the English scholars, Messrs. Grenfell and Hunt (see, for instance, *The Classical Weekly*, vol. xiv, pp. 14-16; *The Classical Review*, vol. xxxiv, pp. 67, 179; *The South Atlantic Quarterly*, April, 1914), and in such a book as *New Chapters in the History of Greek Literature, Recent Discoveries in Greek Poetry and Prose in the Fourth and Following Centuries B.C.*, by J. U. Powell and E. A. Barber (1921). A striking illustration of the value of the papyri in yet a third field, the study of Greek life and Roman life, is afforded by an important volume, "A Large Estate in Egypt in the Third Century B.C., A Study in Economic History," by M. Rostovtzeff, published as *University of Wisconsin Studies in the Social Sciences and History*, No. 6 (1922). The author undertook to assemble into a complete picture the 350 papyri, or more, that give the correspondence of a Carian Greek named Zenon, manager of a great estate of land, originally unimproved, which Ptolemy II (Philadelphus) turned over to his Treasurer of Finance, a Greek named Apollonius. For a review of this book by Prof. W. L. Westermann, of Columbia University, see *The Classical Weekly*, vol. xvi, pp. 110-112.

Towards the end of the decade, through efforts organized by Prof. F. W. Kelsey, of the University of Michigan, various American universities had come into possession of papyrus documents. These were being studied by va-

rious scholars. In the *Transactions of the American Philological Association*, vol. liii (1922), Prof. J. G. Winter, of the University of Michigan, discussed "Some Literary Papyri in the University of Michigan Collection." Prof. C. Bonner, of the same university, discussed "A Papyrus of Dioscurides in the University of Michigan Collection." This gives part of a work entitled *De Materia Medica*, by Dioscurides of Anazarba. At the meeting of the American Philological Association at which these two papers were read, Prof. A. G. Laird, of the University of Wisconsin, presented a paper on "The Wisconsin Papyri," and Prof. A. E. R. Boak, of the University of Michigan, discussed "The Record Office of Tebtunis and Ceresuchon Oros." The last named paper dealt with a register of contracts for a period of four months, Apr. 28 to Aug. 28, 42 A.D.

Just before the beginning of the decade under review, Prof. B. W. Bacon, of Yale University, writing in *The Classical Weekly* (vol. vi, pp. 213-214), declared that "Until very recently no manuscripts of first-rate critical importance had come into American hands." Later, however, classical manuscripts of importance found a resting place in the Morgan Library in New York City. One of these, a fragment of a manuscript of Pliny's *Letters*, was decidedly in evidence in 1924. It had been bought by the late J. Pierpont Morgan in 1910. Dr. E. A. Lowe, a leading authority on classical palaeography, and Prof. E. K. Rand, of Harvard University, published the fragment, in 1922, in a sumptuous monograph, well illustrated by plates, entitled *A Sixth-Century Fragment of the Letters of Pliny the Younger, A Study of Six Leaves of the Uncial Manuscript Preserved in the Pierpont Morgan Library in New York*. Dr. Lowe believes that the fragment is a genuine relic of antiquity, and that it was written in Italy, about 500. Professor Rand believes that it is a part of a codex used by Aldus Manutius, in the preparation of his printed edition of Pliny's *Letters*. This codex, the Codex Parisinus, is now lost. In his views of the fragment, and of Aldus's edition of Pliny, Professor Rand is in sharp collision with Prof. E. T. Merrill, of the University of Chicago, who, in 1922, published a critical edition of the text of Pliny's *Letters*. For reviews of the monograph by Messrs. Lowe and Rand see *The Classical Journal*, vol. xviii, pp. 381-382; *Philologische Wochenschrift*, vol. xliii, pp. 509-511; *American Journal of Philology*, vol. xlv, pp. 88-90; and *The Classical Review*, vol. xxxvii, pp. 139-140. Professor Merrill, in a paper entitled "The Morgan Fragment of Pliny's *Letters*," in *Classical Philology*, vol. xviii, pp. 97-119, takes issue with the views of Professor Rand. Professor Rand began an elaborate reply, in a paper entitled "A New Approach to the Text of Pliny's *Letters*, Article I," published in *Harvard Studies in Classical Philology*, vol. xxxiv, pp. 79-121 (1923).

On Dec. 19, 1906, Mr. Charles L. Freer, of Detroit, Mich., bought, of an Arab dealer in Gizeh, near Cairo, four Biblical manuscripts. These were carefully studied by Prof. H. A. Sanders, of the University of Michigan. The results appear in the following volumes: *Old Testament Manuscripts in the Freer Collection*, Part I, *The Washington Manuscript of Deuteronomy and Joshua*; *The New Testament Manuscripts in the Freer Collection*, Part I, *The*

*Washington Manuscript of the Four Gospels*; *The Old Testament Manuscripts in the Freer Collection*, Part II, *The Washington Manuscript of the Psalms*. These volumes, published in 1910, 1912, and 1917, form parts of the *University of Michigan Studies, Humanistic Series*. For the importance of the manuscripts see *The Classical Weekly*, vol. vi, pp. 214.

In the field of palaeography we must mention E. A. Lowe, *The Beneventan Script, A History of the South Italian Minuscule* (1914), a book which C. U. Clark, in a review in *American Journal of Philology* (vol. xxxv, pp. 340-343), described as "the most important recent palaeographic investigation in any language." A book on a kindred subject which falls within the decade is H. B. Van Hoesen, *Roman Cursive Writing* (1915).

In the remainder of this article, it will be possible only to name a few of the more important contributions made by American classical scholars in Greek and Latin literature, Greek and Roman history, Greek and Roman life, linguistics, and grammar.

The late Prof. John Williams White, of Harvard University, undertook to make a collation of all Aristophanic manuscripts. One outcome of this study was a volume, of nearly 400 pages, *The Scholia on the Aves of Aristophanes, With an Introduction on the Origin, Development, Transmission, and Extant Sources of the Old Greek Commentary on his Comedies* (1914). For an elaborate review of this book, by G. E. Howes, see *The Classical Weekly*, vol. x, pp. 90-95. As a preliminary to that volume, Professor White had published *The Verse of Greek Comedy* (1912), reviewed by M. W. Humphreys (*The Classical Weekly*, vol. ix, pp. 141-144). Professor White died in 1917. In *Harvard Studies in Classical Philology*, vols. xxix, xxx (1918, 1919) appeared two articles, "Collation of the Manuscripts of Aristophanes' *Aves*," and "Collation of the Manuscripts of Aristophanes' *Vespæ*," by J. W. White and E. Cary.

At least three American scholars won distinction during the decade by their articles on Homer—G. M. Bolling, of Ohio State University, S. E. Bassett, of the University of Vermont, and J. A. Scott, of Northwestern University. Professor Scott published also a volume, *The Unity of Homer* (1921). On general progress in Homeric studies see *New International Year Book* for 1921, p. 558.

Mr. Paul Elmer More, formerly literary editor of *The Nation* (New York), published three volumes on Plato: *Platonism* (1917), *The Religion of Plato* (1921), and *Hellenistic Philosophies* (1923).

Works more general in character are *Athenian Tragedy, A Study in Popular Art*, by T. D. Goodell, (1920); and *The Greek Theatre and Its Drama*, by R. C. Flickinger (in two editions, 1916, 1922). Professor Flickinger's book is of prime importance in its field; for a notice of it see *The Classical Weekly*, vol. xvii, p. 197.

Important was an annotated edition, the first published in the United States, of Cicero, *De Divinatione*, by A. S. Pease, published in the *University of Illinois Studies in Language and Literature*, vols. vi, viii (1920, 1923). Two biographies of Cicero by classical scholars appeared: *Cicero of Arpinum, A Political and Literary Biography, Being a Contribution to the History of Ancient Civilization and a Guide to the Study of Cicero's Writings*, E. G.

Sihler (1914); *Cicero, A Biography*, T. Petersson (1919).

Of great service to the student of Horace is *A Concordance to the Works of Horace*, L. Cooper (1916). Prof. G. C. Fiske in a volume entitled *Lucilius and Horace, A Study in the Classical Theory of Imitation* (1920), examined again the whole question of the relation of Horace to Lucilius, his predecessor in satire. Prof. W. A. Merrill published many studies on Lucretius, dealing with his versification, imitations of his expressions by Vergil and other poets, etc. In 1918 he issued an edition of the text of Lucretius, complete (see *New International Year Book* for 1918, p. 492). Prof. Kirby Flower Smith, of The Johns Hopkins University, edited, with introduction and notes, the *Elegies of Tibullus*.

To Vergil, scholars of all countries were giving much attention. In America, two biographies of Vergil appeared: *Vergil, A Biography*, by Tenney Frank, of The Johns Hopkins University, and *Virgil's Biographia Literaria*, by Norman W. De Witt, University of Toronto (1923). Both authors assume that the poems of the so-called *Appendix Vergiliana* were all—or practically all—written by Vergil himself, in his youth, and that we may, therefore, confidently rely on them for important information concerning Vergil's earlier years. Both books abound with interesting and stimulating suggestions on individual points, but as wholes they are to be used only with great caution, especially since there was nothing like agreement, during the decade, among scholars concerning the authorship of the pieces in the *Appendix Vergiliana*. At the close of the last century few scholars believed in their Vergilian authorship. F. Skutsch, however, in his *Aus Virgils Frühzeit* (1901, 1906), set the pendulum swinging, for a while, in the opposite direction. The tendency to accept one or more of the poems in the *Appendix* as Vergilian, as work of Vergil's youth, is seen in the following articles, or books: Miss E. S. Jackson, "The Authorship of the *Culex*," *The Classical Quarterly*, vol. v, pp. 163-174; Th. Birt, *Jugendverse und Heimatpoesie Vergils, Erklärung des Catalepton* (1910: for reviews, by N. W. De Witt and H. W. Prescott, see *American Journal of Philology*, vol. xxxii, pp. 448-458, *Classical Philology*, vol. v, pp. 381-382); J. W. Mackail, "Virgil and Virgilianism, A Study of the Minor Poems Attributed to Virgil," *The Classical Review*, vol. xxii, pp. 65-73; W. G. D. Butcher, "The *Casura* in Virgil and its Bearing on the Authenticity of the Pseudo-Virgiliana," *The Classical Quarterly*, vol. viii, pp. 123-131; R. S. Conway, *The Youth of Vergil* (1915); J. S. Phillimore, "The Text of the *Culex*," *Classical Philology*, vol. v, pp. 418-439; T. Frank, "Vergil's Apprenticeship," *Classical Philology*, vol. xv, pp. 23-38, 103-119, 230-244; E. K. Rand, "Young Virgil's Poetry," *Harvard Studies in Classical Philology*, vol. xxx, pp. 103-185 (1919); A. R. Bellinger, "Catullus and the *Ciris*," *Transactions of the American Philological Association*, vol. liii, pp. 73-82 (1923).

But, latterly, the views of those who would accept the pieces in the *Appendix* as Vergilian was sharply challenged. Especially suggestive here was the work of R. S. Radford: "The Juvenile Works of Ovid and the Spondaic Period of his Art," *Transactions of the American Philological Association*, vol. li, pp. 146-171

(1920); "The Priapeia and the Vergilian Appendix," *Transactions of the American Philological Association*, vol. lii, pp. 148-177 (1921); "Tibullus and Ovid," *American Journal of Philology*, vol. xlv, pp. 1-26, 230-259, 293-318 (1923). Professor Radford believes that the whole Vergilian Appendix is the youthful work of Ovid, "composed by him in the period extending from 27 to 8 B.C." In the *Transactions of the American Philological Association*, vol. liii, pp. 5-34 (1923), Prof. H. R. Fairclough, of Stanford University, in a paper entitled "The Poems of the *Appendix Vergiliana*," after study of the vocabulary of the poems in the *Appendix*, maintained that "probably not a single one of these poems has been correctly assigned to Vergil."

More general works in the field of Latin literature are E. G. Sihler, *From Augustus to Augustine, Essays and Studies Dealing with the Contact and Conflict of Classic Paganism and Christianity* (1923), and E. T. Merrill, *Essays in Early Christian History* (1924).

In the field of Greek history we may note, first, G. W. Botsford and E. G. Sihler, *Hellenic Civilization* (see *New International Year Book* for 1915, p. 497). C. W. Blegen wrote *Korakou, A Prehistoric Settlement Near Corinth* (1921), published by the American School of Classical Studies at Athens. The civilization unearthed by excavations at Korakou, a hillock 3 kilometers west of the site of ancient Corinth, is of the type known as "Helladic," a term (see under *ARCHAEOLOGY*) devised to distinguish the prehistoric civilization of the Greek mainland from the prehistoric civilization found in the Cyclades Islands ("Cycladic") and in Crete ("Minoan"). Mr. Blegen's book deals with remains dating from 2500 to 1100 B.C. Important, too, is M. Rostovtzeff, *Iranians and Greeks in South Russia* (1922).

Works on Roman history are the following: A. E. R. Boak, *A History of Rome to 565 A.D.* (1921); T. Frank, *Roman Imperialism* (1914), *An Economic History of Rome to the End of the Republic* (1920), and *A History of Rome* (1923); T. S. Jerome, *Aspects of the Study of Roman History* (1923); G. Showerman, *Eternal Rome, The City and Its People From the Earliest Times to the Present Day* (1924).

In the field of Greek and Roman life we can mention only W. S. Fox, *The Mythology of the Greeks and Romans* (1916); W. C. Greene, *The Achievement of Greece* (1923); W. W. Hyde, *Olympic Victor Monuments and Greek Athletic Art* (1921), reviewed by G. H. Chase, *The Classical Journal*, vol. xix, pp. 119-120, and D. M. Robinson, *The Classical Weekly*, vol. xvii, pp. 59-62; C. H. Moore, *The Religious Thought of the Greeks* (1916), and *Pagan Ideas of Immortality During the Early Roman Empire* (1918); E. Tavenner, *Studies in Magic From Latin Literature* (1916); L. Van Hook, *Greek Life and Thought* (1923).

In the field of Greek grammar, we name two important books, by H. W. Smyth, of Harvard University: *A Greek Grammar for Schools and Colleges* (1916), and *A Greek Grammar for Colleges* (1920). The latter book is worthy of a place beside the *Greek Grammar* of W. W. Goodwin, long the favorite Greek grammar of Greek scholars and teachers in the United States and in England. Of prime authority in its field is A. T. Robertson, *A Grammar of the Greek New Testament in the Light of Histor-*

ical Research (1914—there is a second, revised edition).

In the field of Latin grammar quite the most impressive achievement in America between 1900 and 1924 was the work of Prof. C. E. Bennett, *The Syntax of Early Latin: Volume I, The Verb* (1910), Volume II, *The Cases* (1914). This work completely supersedes all previous discussions of the syntax of early Latin. For reviews, by C. Knapp, see *American Journal of Philology*, vol. xxxii, pp. 333-343; vol. xxxv, pp. 268-293.

In linguistics three American scholars are doing excellent work—L. Bloomfield, R. G. Kent, and E. H. Sturtevant. The work of Professor Kent is to be found in the periodicals, especially in the *Transactions of the American Philological Association*. Professor Bloomfield published also a book, *An Introduction to the Study of Language* (1914). Professor Sturtevant issued two books: *Linguistic Change* (1917), and *The Pronunciation of Greek and Latin, The Sounds and Accents* (1920).

In lexicography, foremost was the monumental *Lexicon Plautinum*, by Prof. G. Lodge, of Columbia University, which had been in course of publication since 1901. Nine parts, totaling 864 large pages, and carrying the *Lexicon* into *Ita*, had been issued. Prof. M. N. Wetmore, of Williams College, published two important works, *Index Verborum Vergilianus* (1911) and *Index Verborum Catullianus* (1912); for reviews see *The Classical Weekly*, vol. vi, pp. 101-103, 109-111, 124. Professors W. A. Oldfather, A. S. Pease, and H. V. Canter, of the University of Illinois, published "Index Verborum Quae in Senecae Fabulis Neenon in Octavia Praetexta Reperiuntur," in *University of Illinois Studies in Language and Literature*, vol. iv (1918). Professors A. A. Howard and C. N. Jackson, of Harvard University, published *Index Verborum C. Suetoni Tranquilli Stilique Proprietatum Nonnullarum* (1922).

**PHILOLOGY, MODERN.** In making this brief sketch of the progress of philology during the 10 years 1914-1924, it behooves us to stress first of all the salient tendencies characterized by the vast volume of production in this ever-growing field of research. Thereafter the most important languages as viewed from the vantage point of intensity and originality of investigation—will claim our attention. To attempt to go further into detail is well-nigh impossible considering the space limitations. There shall even be no endeavor to list all the chief contributions made during this period, for such a classification would perforce be tentative and subject to the criticism of divergent opinion. The most carefully developed criteria often fail to be conclusive. It is necessary, therefore, that the selection be limited to such works as indicate the directions in which investigations are being carried on.

The War, which interrupted the period to which we are to devote our attention, had, from the philological point of view, two important consequences. On the one hand, it served to check, though not entirely, the outworn methods of investigation which had attained the zenith of their effectiveness before the close of the nineteenth century; while on the other, it made obvious to students of philology the vast possibilities that lay within their reach.

Already in 1914 it was noted in the pages of the *New International Year Book* that the

study of philology was undergoing a process of transformation. The self-styled "Back to Nature" school founded in the early nineties by German scholars under the leadership of Schuchardt, a profound though not very original scholar, believed they could arrive at general laws, applicable to all possible cases, by means of the study of dialects. Their preferred method, so aptly designated *Sprachmischung*, or the mutual penetration of dialects, failed to satisfy expectations, because of the numerous historical factors and variable accessory circumstances which must always be taken into consideration. The new French school, with the equally profound and more brilliant Meillet at its head, hastened to reject entirely the esoteric philology which isolates linguistic facts from all contact with life, and began to interpret linguistics by the social movements of civilization—in a word, to seek in the development of languages the result of political and social actions. While the War retarded development of research along these lines by diverting the attention of the disciples of the French scholar into channels of a military nature, it served, however, to prove the truth of his contentions.

The year 1915 was most discouraging for philologists. Because of its appalling losses it was feared by some that the movement initiated by Meillet was destined to undergo entire arrestment of development. Notwithstanding the gloomy outlook, it was generally felt that, though retarded for the time being, the revolution—for such it has proved to be—would take place.

Toward the close of the year 1915, there appeared the two-volume epitome entitled *La Science Française*, the genesis of which was due to the initiative of the founders of the library of French thought at the International Exposition at San Francisco. In the second volume is to be found the very suggestive survey of linguistics (*La Linguistique*) by Antoine Meillet. According to this philologist, French scholars, although they entered this field of research long after the ground had been broken by the Germans, realized at once its possibilities. Notwithstanding that there have been numerous German schools of philology, there has never been a French school for the mere reason that *savants* of that nationality have always drawn their conclusions from data, and have refrained from accepting any theory that was not entirely in harmony with facts. At the outset, French philologists sought to approach the subject from every angle in order to bring all possible light to bear upon it. It is this above all which has led to the introduction of new fields of investigation, such as semantics, dialectology, phonetics and kindred subjects. The outcome of these methods was not only the monumental *Atlas Linguistique de la France* of Gilliéron and Edmont, of which, according to the eminent critic Gaston Paris, French scholarship may well be proud, the *Sémantique* of Bréal, in which are laid the foundations of the science of the development of meanings of words, and the *Dis-similation Consonantique* of Grammont, a work so original that we have not yet grasped its full significance; but also the *Histoire de la Langue Française* of Brunot which, says M. Jeanroy, has no equivalent in any other country, the great impulse given to experimental phonetics by the researches of Abbé Rousselot and others, the development along characteristic lines of

the school of Celtic philology, and finally, the rehabilitation of the spoken language made by Meillet himself in his suggestive contributions to the study of Armenian, Slavic and Greek. It is thus not so much by *des recherches de détail* (which, however, have their importance), as by the *introduction de vues neuves et de directions originales* that comparative philology has received new vigor from French thought.

Following the lead of Meillet, one of the editors of the monumental *Atlas Linguistique de la France*, J. Gilliéron, published at Neuveville, Switzerland, a series of lectures entitled *La Faillite de l'Étymologie Phonétique* in which he opened the attack from a new quarter. As the title indicates, the learned author admits the inadequacy of the methods in vogue, notwithstanding the yeoman service they may have rendered in the past, to cope with present-day problems. The mere fact that such a question is posed frankly and fearlessly by scholars of the rank of Gilliéron shows that philologists are alive to the new demands made upon them.

The most striking feature of the year 1921 was the great revival of interest in the study of language and its attendant problems. It seems that many Europeans have sought solace from the disillusionments of war in the inspiration furnished by President Wilson's cherished theory of self-determination according to linguistic and racial unity. This has been a most vital and stirring problem with all of these peoples more or less from almost time immemorial.

Encouraged no doubt by this general tendency, M. Meillet returned to the investigation of fundamental problems of comparative linguistics. In a volume of essays entitled *Linguistique Historique et Linguistique Générale*, published in 1921, this scholar laid definitively the basic principles for the reconstitution of the methodology of this subject. In his opinion, all languages show common tendencies, determined, on the one hand, by the structure of the vocal organs and the limited number of phonetic possibilities that they offer, and, on the other, by the laws of general psychology. These tendencies are obvious in such universal changes as the weakening of intervocalic consonants, vowel-breaking, or in the normalization of paradigms through the principle of analogy. "Le changement linguistique," says M. Meillet, "est lié à des faits de civilisation et à l'état des sociétés qui emploient les langues considérées." In so far as it is a means of communication between the members of a same clan or of a same nation, language tends either to become infinitely differentiated or to fuse its divergent dialects into a common speech, according to the inclination to division or unification of the groups or peoples that speak it. The progress of language is inseparably bound up with the progress of society.

It is thus in extending our grasp of the great problem of linguistics that we are approaching more closely an understanding of the race as well as the individual. However imperfect language may be as an expression of our thought, it is nevertheless the sole means in our possession. It serves therefore in its limited way to reveal our mental attitude. As stated above, M. Meillet is thus leading philology from the arid domain of phonetic formulas into the very fertile, though most intricate, field of human life. Henceforth the term philology will signify much more than a mere

juggling with forms: it is rather, to use the words of H. C. Wyld in his address on *English Philology in English Universities* (Oxford, 1921) "the study of human speech modified, altered, enriched at every stage by influences both literary and historical."

If we now turn to a more specific aspect of linguistics, i.e. grammar, we find that the same conditions obtain. In 1914, we noted that in regard to grammar there was a reaction against the study of the history of languages in favor of the general principles of the theory of language. O. Jespersen's *Modern English Grammar on Historical Principles* (Heidelberg, 1914) represents to a certain extent an effort to revive the teaching of grammar which, it may be said, had only slightly shown the effects of the progress of linguistics during the course of the century just passed.

It was while making efforts to broaden and improve their methods in accordance with modern scientific research that scholars became aware that, with the possible exception of philosophy, theology and medicine, the study of language was hemmed in and impeded on all sides by tradition and intolerance. From the more or less remote past we have inherited a rigid methodology applicable to dead synthetic languages but totally inadequate to solve the problem of the living analytic tongues and their relationship with a dynamic life teeming with new ideas. But, as history should teach us, there is no compromise with intolerance and tradition; and just as science was obliged to engage in open warfare with theology, so modern philology is entering the lists against its most redoubted and firmly entrenched opponent, which is our antiquated, though universally accepted, conception of grammar and its laws.

Consequently, *La Pensée et la Langue* (Paris, 1922), the stimulating volume by Ferdinand Brunot, the distinguished dean of the University of Paris, is in many respects an epoch-making work. Bearing as a sub-title *Méthode, principes et plan d'une théorie nouvelle du langage appliqué au français*, this manifesto by an author widely known for his monumental history of the French language mentioned above, purports to be a "methodical statement of facts derived from thought and interpreted and classified in its relation to language, and of the means of expression corresponding to them." After showing how every innovation in linguistic methodology has sooner or later been thwarted by a mediæval heritage of grammatical concepts and nomenclature—even comparative philology was obliged to surrender many of its revolutionary doctrines when confronted by a glowering and tyrannical tradition—M. Brunot observes that, thanks to the efforts of our "grammatical commissioners of police," the teaching of language to-day—like theology—is "a drudgery, the pet aversion of both pupils and teachers." Not even does orthographical reform escape the inquisition. And he passes in review many gross blunders that the high priests of grammar dole out to the young as established facts, such as a tense which they interpret as a mood, a future-perfect which has been disguised as a conditional, theories built upon misconstructions, etc. He adds, therefore, that it is high time to prepare a *Manual of Wrong Rules* as a pedagogical breviary which should protect the young against the "fundamentalism" of misguided

dogmatists. And therefore the object of M. Brunot's work is "the practical study of grammar with a view to enable the student to understand and express everything."

As a consequence of the rapid development of the cinematograph, the aeroplane and the radio-telephone, which are rendering geographical boundary an anachronism and are ameliorating international communication and, therefore, international good will, more widespread attention is rightly being devoted to comparative philology. Though only a century old, its influence in the cause of international understanding has been far-reaching. In past ages each country had the utmost contempt for foreigners unable to speak its tongue. To the ancient Hindus they were *mlecchas* (Prakrit *milicchhu*, Pali *milakkhu*, barbarian), 'incomprehensibles'; to the Jews, *gojim*, 'infidels'; to the Arabs *adsham*, 'babblers'; to the Turks *giaours* (Turkish *jawr*, *gawur* < Persian, *gaur*, 'infidel,' another form of *gabr*, 'infidels,' 'Gueber'), 'unbelievers,' 'miscreants'; to the Greeks *barbarophonoï* or *barbaroi*, 'stammerers,' and later 'uncultured' or 'barbarians.' Even to-day the French *charabia* 'gibberish' (Spanish *alg-arabia*, the 'Arabic language'), or *baragouin*, 'jargon' (Breton *bara*, 'bread,' and *gouin* 'wine,' offered to the French invaders of Brittany); or the Mexican *gringo* (Spanish *griego*, 'Greek'), applied especially to the inhabitants of the United States; or the North American *wap* (Spanish *guapo*, 'handsome'), or *dago* (Spanish-Portuguese *Diego*, 'James,' a term of address) have all now assumed a pejorative connotation and betoken the same spirit of contempt for the foreigner. But when comparative philology began to reveal that the so-called Indo-European languages were offshoots of the same parent stock, the alien tongue was no longer despised as the product of an inferior mind. The finest compliments ever paid to a somewhat abstruse subject of research were the numerous efforts during the War to explain acts of aggression as a moral obligation to preserve continuity or relationship of speech.

Some one has suggested that the present period of the world's history will be designated in future times as the "dictionary epoch." In fact, never has such interest been shown in living foreign tongues. The vast number of dictionaries or vocabularies—of which a few titles have been noted in the pages of the *New International Year Book* in the 10 years furnishes a striking testimony to the desire of most nations to avoid cultural or commercial isolation. Likewise, the study of phonetics, which during the first half of its 40 years of history passed almost unnoticed, is now, as noted above, arousing widespread interest, especially because of the assistance it affords in pronouncing accurately a foreign tongue. In response to this great demand on the part of our public, several of our largest educational institutions are offering courses in this subject as well as opportunities for research. And it may be added that the 10 distinguished foreign scholars, representing France, Spain and Italy, who lectured or taught in Columbia University in the summer of 1923, stressed the culture, civilization and language of their respective countries. A final indication of the awakening of the spirit of international fraternization may be gathered from the almost universal recognition of the need of a universal tongue. Since the decline of Latin

in the seventeenth century, all efforts to create a substitute have been derided as the work of impractical idealists. But that these dreamers are now being taken seriously is obvious from an editorial in the *New York World* of Dec. 26, 1923, which affirms the necessity of a "radio language." In the spring of 1923 a movement to revive Esperanto as an international language was begun by a committee headed by Mrs. Dave Morris of New York; and their efforts are already bearing fruit, for many of our educational institutions, notably Columbia University, have now included Esperanto in their curricula of studies. See INTERNATIONAL LANGUAGE.

**Bibliography.** For further information see the series of articles entitled "Philology, Modern," appearing in the *New International Year Book* from 1910 on. Inspired, no doubt, by the example set by the *New International Year Book*, a number of British scholars began to issue in 1920 a *Year Book of Modern Languages* which contains extensive data.

**General.** F. de Saussure, *Cours de Linguistique Générale*, edited by Bally and Séchehaye (Paris, 1916-23); C. S. R. Collin, *Bibliographical Guide to Sematology* (Lund, 1915); A. Werner, *The Language-Families of Africa* (London, 1917); H. Schuchardt, *Sprachverwandtschaft* (Berlin, 1917); L. Dominian, *Frontiers of Language and Nationality in Europe* (New York, 1918); A. Meillet, *Les Langues dans l'Europe Nouvelle* (Paris, 1918); A. Aarne, *Vergleichende Rätselforschungen* (Helsingfors, 1918); H. Miller, *Die semitischvorindogermanischen Laryngalen Konsonanten* (Copenhagen, 1917); Abbé P. T. Mainage, *Les Religions de la Préhistoire* (Paris, 1920); H. Schuchardt, *Sprachursprung* (Berlin, Pt. II, 1920); J. de Morgan, *L'Humanité Préhistorique* (Paris, 1921); J. Marouzeau, *La Linguistique ou Science du Langage* (ib.); E. Sapir, *Language* (New York, 1921); O. Jespersen, *Language, Its Nature, Development and Origin* (London, 1922); J. Vendryès, *Le Langage* (Paris, 1922); A. Dauzat, *La Géographie Linguistique* (ib., 1922); W. M. Thomas, *Language in the Making* (New York, 1923); E. W. Hopkins, *Origin and Evolution of Religion* (New Haven, 1923).

**Indo-European.** Works on the language of the primitive Indo-Europeans are devoted mainly to phonology and morphology. Among the more important are: H. Hirt, *Fragen des Vokalismus und der Stammbildung im Indogermanischen* (Strasbourg, 1914); K. Brugmann and B. Delbrück, *Grundriss der vergleichenden Grammatik der Indogermanischen Sprachen* (2d ed., 1916, Strasbourg); O. Schrader, *Reallexikon der Indogermanischen Altertumskunde* (2d ed, ib., 1917- ); H. Güntert, *Indogermanische Ablautprobleme* (ib., 1916); W. Streitberg, *Erforschung der Indogermanischen Sprachen* (Strasbourg, 1916); S. Feist, *Indogermanen und Germanen* (2d ed., Halle, 1919); C. Bartholomae, *Zur Etymologie und Wortbildung der Indogermanischen Sprachen* (Heidelberg, 1919); H. Hirt, *Indogermanische Grammatik* (Pt. II, Heidelberg, 1921); H. H. Bender, *The Home of the Indo-Europeans* (Princeton, 1922); A. Meillet, *Les Origines Indo-Européennes des Mètres Grecs* (Paris, 1923).

**Indo-Iranian.** Contributions to this field were less numerous. They consist principally of translations and grammatical and syntactical studies of texts. Somewhat out of the ordinary

are: Jouveau-Dubreuil, *Archéologie du Sud de l'Inde* (2 vols., Paris, 1914); Gauthiot, *Essai de Grammaire Sogdienne (Groupe Iranique)* (ib.); A. V. W. Jackson, *Catalogue of Persian MSS. Presented to the Metropolitan Museum of Art by A. S. Cochran* (New York, 1914); C. Bartholomae, *Zur Kenntnis der Mitteliranischen Mundarten* (Heidelberg, 1917); H. Oldenberg, *Zur Geschichte der Altindischen Prosa* (Berlin, 1917); and Sir G. A. Grierson, *Linguistic Survey of India* (vol. x, Calcutta, 1921) containing specimens of languages of the Iranian family.

*Slavic.* Among the numerous contributions, we may note Berneker, *Slavisches Etymologisches Wörterbuch* (vol. i, A-L, Heidelberg, 1908-13); Vondrák, *Altkirchenslavische Grammatik* (2d ed., Berlin, 1914); J. Herzer, *Böhmisch-deutsches Wörterbuch* (Prague); R. J. Kerner, *Slavic Europe* (Cambridge, Mass., 1918), a bibliography; H. H. Bender, *Lithuanian Etymological Index* (Princeton, 1922); L. Niéderlé, *Manuel de l'Antiquité Slave* (vol. i, Paris, 1923). Other studies include Slovenian, Ruthenian-Ukrainian, Russian, Czech (see *Year Book*, 1916, 1918, 1919; Baltic (1915, p. 499; 1920, p. 537; 1922, p. 563); Serbo-Croatian (1918, p. 495; 1915, p. 499); Serbian (1916, p. 537); Polish (1918, p. 495, 1916, p. 537); Ukrainian (1917, p. 537; 1918, p. 495); Lithuanian (1918, p. 495; 1920, p. 537; 1922, p. 563); Old Prussian (1918); Bulgarian (1919).

*Celtic.* Studies in Irish, Manx, Scotch, Welsh, Cornish and Breton as well as Gaulish and Pre-Celtic have appeared more or less every year. Among the more important are: C. Jullian, *Histoire de la Gaule* (4th vol., Paris, 1914); G. Dottin, *Manuel pour Servir à l'Etude de l'Antiquité Celtique* (Paris, 1915); John Strachan and J. G. O'Keefe's edition of the *Táin Bó Cuáinge* (Dublin, 1916); *Catalogue of the Bradshaw Collection of Irish Books in the University Library of Cambridge*, 3 vols. (1916); K. Meyer, *Zur Keltischen Wortkunde* (Berlin, 1917-19); E. Cartailhac, *Dictionnaire Archéologique de la Gaule* (vol. ii, Paris, 1919); G. Dottin, *La Langue Gauloise* (ib., 1920); J. Loth, *Remarques et Additions à la Grammaire Galloise Historique et Comparée de John Morris Jones* (Paris, 1920); E. Le Blant, *Inscriptions Chrétiennes de la Gaule* (2 vols., Paris, 1923); J. D. Bruce, *The Evolution of Arthurian Romance from the Beginnings Down to the Year 1300* (Baltimore, 1923).

*Germanics.* Contributions to the Germanic languages are so numerous that it would be vain to list even the more important. The reader is referred therefore to various editions of the *New International Year Book*. Under the same general heading will also be found works in Frisian, Gothic, etc. Among these contributions are: J. Hoops, *Reallexikon der Germanischen Altertumskunde* (Berlin, 1915-19); Grimm's *Deutsches Wörterbuch* (Leipzig); H. Fischer, *Schwäbisches Wörterbuch* (Tübingen); Jellinghaus-Förstemann, *Altdeutsches Namenbuch* (Bonn); the *Schweizerisches Idiotikon*, *Wörterbuch der Schweizer-deutschen Sprache* (Frauenfeld); J. Zupitza, *Einführung in das Studium des Mittelhochdeutschen* (Chemnitz, 1916); J. Schatz, *Altbairische Grammatik* (Göttingen, 1915); A. Meillet, *Caractères Généraux des Langues Germaniques* (Paris, 1917); B. Delbrück, *Germanische Syntax* (Leipzig, 1916-19); H. Paul, *Deutsche Grammatik* (2 vols., Halle,

1916-17); E. Sievers, *Metrische Studien* (Leipzig, 1919); S. Feist, *Etymologisches Wörterbuch der Gotischen Sprache* (Halle, 1920); H. Hirt, *Geschichte der Deutschen Sprache* (Munich, 1919); H. Paul, *Deutsche Grammatik* (vols. iii, v, Halle, 1920); F. Kluge, *Deutsche Sprachgeschichte* (Leipzig, 1921); F. A. Wood, *Verner's Law in Gothic* (Chicago, 1922); E. Steinmayer and E. Sievers, *Die Althochdeutsche Glossen* (vol. v, Berlin, 1922); O. Behaghel, *Deutsche Syntax* (Heidelberg, 1923); and A. Pinloche, *Etymologisches Wörterbuch der Deutschen Sprache* (Paris, 1923).

*Scandinavian.* This group of indefatigable scholars made valuable contributions to Old Norse, Icelandic, Swedish, Danish, Norwegian, etc., such as the Swedish Academy's *Ordbok Öfver Svenska Språket* (Lund); Egilsson and Jönsson, *Lexicon Poeticum Antiquae Linguae Septentrionalis: Ordbog over det Nordisk-islandske Skjaldesprog* (Copenhagen); A. Torp, *Nynorsk Etymologisk Ordbok* (Christiania); Noreen, *Vart Språk* (Lund); Klara Stroebe, *Nordische Volksmärchen*, edited by F. von der Leyen and P. Zaunert (2 vols., Jena, 1915); W. A. Craigie, *The Icelandic Sagas* (New York, 1915); *Diplomatarium Islandicum* (1310-1544) (Reykjavik, 1916); A. Koek, *Svensk Ljudhistoria* (vol. iv, Lund, 1920); O. Oestergren, *Nusvensk Ordbok* (Stockholm); E. Hellquist, *Svensk Etymologisk Ordbok* (Pt. I, Lund, 1920); H. Hermannson, *Bibliography of the Eddas* (Ithaca, 1920); V. Dahlerup, *Det Danske Sprogs Historie* (Copenhagen, 1921); J. Jakobsen, *Etymologisk Ordbok over det Norrone Sprog på Shetland* (4 vols., Copenhagen, 1908-21); V. Dahlerup, *Ordbog over det Danske Sprog* (vol. iii, Copenhagen, 1922); E. Sievers, *Die Edda Lieder* (Leipzig, 1923).

*English.* As no selected list of works could do justice to such an extensive collection, we will limit our attention to Dr. Murray's *New English Dictionary* (Oxford); H. Harrison, *Surnames of the United Kingdom* (London); *Crabbe's English Synonyms* (Anniversary edition, New York, 1917); H. L. Mencken, *The American Language* (New York, 1919); P. G. Thomas, *Introduction to the History of the English language* (London, 1920); R. W. Chambers, *Introduction to the Study of Beowulf* (ib., 1920); H. C. Wyld, *History of Modern Colloquial English* (ib., 1920); K. Luick, *Historische Grammatik der englischen Sprache* (Leipzig); E. Weekley, *Etymological Dictionary of Modern English* (London, 1921); T. N. Toller, *Anglo-Saxon Dictionary* (Oxford, 1922); R. Huchon, *Histoire de la langue anglaise* (Paris, 1923).

*Romance.* The continued activity of scholars in this domain bespeaks the immense wealth of material at the disposal of the philologist. Incessant publication of new texts has had as a consequence reorganization of material and revision of methods. As examples may be cited Meyer-Lübke's *Romanisches Etymologisches Wörterbuch* (Heidelberg); Bédier's celebrated *Légendes épiques* (Paris, 2d ed., 1922) of which the first edition was completed in 1913. Other works are G. Nicholson, *Recherches Etymologiques Romanes* (Paris, 1921); E. Bourciez, *Éléments de Linguistique Romane* (ib. 1923); G. Millardet, *Linguistique et Dialectologie Romanes* (ib., 1923).

*French.* K. Nyrop, *Grammaire Historique de la Langue Française* (3d ed., Copenhagen); A. Tobler, *Altfranzösisches Wörterbuch*, edited

by E. Lommatzsch (Berlin); A. Haase, *Syntaxe Française du Dix-septième Siècle* (trans. by M. Obert, Paris, 1916); F. Brunot, *Histoire de la Langue Française des Origines à 1900* (vol. v, Paris, 1917); K. Vossler, *Französische Philologie* (Gotha, 1919); L. Gauchet and J. Jeanjaquet, *Glossaire des Patois de la Suisse Romane* (vol. ii, 1920); J. Gilliéron, *Etude de Géographie Linguistique* and supplement to vol. i of the *Atlas Linguistique de la France* (Paris, 1921); A. Longnon, *Les Noms de Lieux de la France* (Paris, 1920-22); G. Erüger, *Französische Synonymik* (Dresden, 1922); P. Barbier, *English Influence in the French Vocabulary* (New York, 1922); W. von Wartburg, *Französisches Etymologisches Wörterbuch* (Bonn, 1922); J. Vising, *Anglo-Norman Language and Literature* (Oxford, 1923); P. Désormaux, *Bibliographie Méthodique des Parlers de Savoie* (Paris, 1923).

*Italian.* Diachnology and lexicography have held the attention of Italian scholars. Among these works are G. Bertoni, *Italia Dialettale* (Milan, 1916); E. Monaci, *Studi Romanzi* (Rome, 1917); V. Restori, *Dal Latino Plebec all' Italiano Illustre* (Mantua, 1923); L. Spitzer, *Italianische Umgangssprache* (Bonn, 1922); and G. Saccà, *La Lingua Italiana e la sua Evoluzione* (Catania, 1923).

*Spanish.* The numerous dialects spoken over the vast territory once forming the colonial possessions of Spain afford an inexhaustible subject for the philologist. Among the contributions are the 14th edition of the *Diccionario de la Lengua Castellana*, by the Spanish Royal Academy (Madrid, 1914); *Diccionario Gallego-Castellana* by the Royal Galician Academy (Coruña); A. Castro and F. de Onis, *Fueros Leoneses* (Madrid, 1916); Spanish Royal Academy's *Gramática de la Lengua Castellana* (new edition, Madrid, 1917); M. A. Roman, *Diccionario de Chilenismos y de Otras Locuciones Viciosas* (5th vol., Santiago de Chile, 1916-18); R. Foulché-Delbosc and L. Barreau Dihigo, *Manuel de l'Hispanisant* (vol. i, New York, 1920); A. Zauner, *Altspanisches Elementarbuch* (Heidelberg, 1921); and R. Menéndez Pidal, *Documentos Lingüísticos de España* (Madrid, 1923).

*Dictionaries, etc.* As we have noted heretofore, because of the numerous languages involved in the War, public attention became focused on language study. However, to meet the immediate emergency a vast number of dictionaries, language manuals, and phrase books were published containing vocabularies not only of the numerous sciences drafted into the War, but also for commercial intercourse and even social amenities. During the War an attempt was made by the writer to supply a fairly complete list of such manuals and dictionaries. Space limitations make it impossible of repetition here. The reader is therefore referred to the following editions of the *New International Year Book*: 1915, p. 502; 1916, pp. 537-540; 1917, pp. 536-537; 1918, pp. 494-497; 1919, p. 522; 1920, p. 539, etc. Likewise for the interest developed in the courses conducted in many American universities and colleges for prospective officers enrolled in the Students' Army Training Corps, see the *New International Year Book* for 1918 (pp. 495-496).

**PHILOSOPHY.** The developments of greatest philosophical significance in the field of natural science were incidental to the attempt

of the scientists to find a way of passing from one supposedly discreet science to another. The attempt to bridge the gulf between mathematics and physics issued in the theory of relativity; similarly the attempted transition from physics to chemistry resulted in the statement of the problem of the structure of the atom and the quantum theory as a tentative answer. Less was done to articulate biology with its forerunning sciences because the questions in that region are still manifold, but the controversy over vitalism and mechanism and the investigation of colloidal substances is significant. Psychology, at least in the English-speaking world, was in great danger of being subsumed under the other sciences such as physics, biology and physiology, rather than being recognized as sufficiently independent to warrant the assignment of a special place and function in the scientific field. However, if we recognize the psychologist's hope of differentiating psychology proper, social psychology and the psychology of society and sociology, we could make a fairly complete picture of the intellectual market place of 1924—a picture which would gratify a follower of Comte at any rate.

However, this tendency to integrate the sciences did not exactly follow the lines of development laid down by Comte. Neo-positivism accounted for scientific thought in terms of mathematical correlation. Its chief spokesman reduced scientific hypothesis to the level of mathematical equation; the entity hypothesis was excluded as far as possible; the terms in these equations were merely convenient expressions substituted for observations and thus made amenable to mathematical treatment. This intellectual asceticism was justified by the facility it contributed to the scientific treatment of experience. It also enabled the scientist to appeal to mathematical presuppositions instead of outworn metaphysics when he was hard pressed to give some further account of his theories.

This need for interpretation, especially with regard to scientific formulas which involve non-Euclidean geometry, led to the further development of postulate theory and mathematical logic. So when, in 1919, it appeared that at least one of Einstein's predictions, which were based largely on non-Euclidean geometry and rather unconventional postulates, had been verified, greater importance was attached to the work of Peano, Frege, Cantor, Dedekind, Whitehead and Russell in mathematical theory. Here was observational evidence not only for Einstein's theory of relativity, but a naïve philosophical mind was tempted to conclude that the mathematical presuppositions were also verified. Some not so well trained in mathematical theory were tempted to claim verification for their own special brand of metaphysics on the same ground. The discovery of the displacement of Mercury at perihelion was like Thales' discovery of the marvelous uses of the waters of the Nile and the subsequent founding of the Ionian school of nature philosophies: water, fluid, ice, steam, mathematics, non-Euclidean geometry, postulates, mathematical logic. We now had a scientific method in philosophy.

The more cautiously minded mathematicians and scientists disowned any such extrapolation, and rejoiced over the great advantages afforded by the theory of relativity for scientific method. The more philosophically minded saw the problem of rendering such an enormous system in-

telligible not so much for science as for human culture. Whitehead resolved to recast the fundamentals of physics to fit in with the new theory, and for this found his method of extensional abstraction most convenient. Cassirer, a neo-Kantian, took the opportunity to show how the Platonic element in the Kantian *a priori* had in it the capacity to assimilate the new mathematical physics and thus discharge the obligation to be intelligible, which science had neglected to fulfill. Brunschvicg found it possible to go still further and link up the Spinozistic tradition of intellectual intuition or judgment with the equally Spinozistic "world of numbers" presented by Einstein. Out of this approach there results an onward march of man, the author of science.

Running along beside these theories of relativity, which are concerned mainly with the application of mathematics to astronomical physics, were the investigations of the structure of the atom, which use other and apparently divergent mathematical hypotheses. Here again the naïve mind found a springboard for metaphysics, and the cautious critical mind contented itself with mathematical correlations. The philosophical significance seems to lie in the field of epistemology rather than in logical theory as in the case of relativity. Philosophers of physics like Broad attempted to include and articulate the psychology of perception processes with physical action, while G. E. Moore supplied a Platonic metaphysics to support it.

The other natural sciences present problems like these, though less clearly formulated. The best scientific mind uses imagination and mathematics, the best philosophical mind criticizes and sets the results in consistent order, and this is fortunate for science. But it should be remembered that this is science, with philosophy as handmaiden. The scientist discovers and classifies, calling for philosophical criticism only to render his material intelligible, when no further progress can be made without such insight. Insight or wisdom performing this function is intellect domesticated or enslaved; mathematics and logistics take the place of logic; ethics, aesthetics, and metaphysics are ignored. Yet one sees in this commandeering of the philosophic insight and intuition the start of a return to the greater tradition in philosophy. The reference of scientific findings to an intellectually grasped or constructed system is not a new trick. One remembers that Plato found a function for hypothesis in his ascent to the ideas. Also, one must not forget that the modern procedure is not accidentally Platonic. The earlier Russell did not despise Platonism, and the latest Santayana embraces it with true æsthetic enthusiasm. What matters it that system or essence is substituted for the idea? Cassirer is not frightened by the dialectic Nemesis that follows.

The rivals to this positivistic naturalism are the modern humanists. One would like here to review the so-called realistic and psychological novel and compare it with the Greek tragedy as the objectification of opinions on fundamentally philosophical themes. Or, on another level one might sift behavioristic and Freudian psychology for nuggets of wisdom, but here again we find the professional philosopher buying and using the novelist's and scientist's knowledge. The rationale of his doctrines is the biologist's or the sociologist's dogmas. The most obvious

illustration of this is the pragmatic tradition in America. James, Freud, and Watson have sold their functional psychologies to both the professionals and the guildsmen of humanistic sciences. Their psychologies are ultimately physiological, biological, or sociological, and the philosophizing which one finds is the reference of this or that particular fact to one of these systems. Humanism means then that man the organism, man the psyche, man the citizen of a commonwealth is the measure of all things. Glands, unit characteristics, instincts, conditioned responses, complexes, survival value, adaptation, social expediency are terms to conjure with. They are the inner fates and Nemesis of our human existence. Yet the relativism of these concepts is admitted in the writings of Dewey, Pound and McDougall. Man's creative intelligence measures, and moves on.

In France, Durkheim and Lévy-Bruhl and in England Westermarck and Hobbhouse set up the science of anthropology as a system of reference. Æsthetics, logic, ethics, all have a genesis and *raison d'être* in man's social experience. *Mores*, taboos, and ritual supply the necessity of man's life and knowledge. But there was a more sophisticated European tradition which had not only appropriated but assimilated the concepts of biology and anthropology. It not only avoided but condemned what it called psychologism. It reduced scientific classification and subordination to the level of arbitrarily specialized categories, and asserted the superiority and finality of the intuitive comprehension of experience. It drew upon Spinoza, Kant, and Hegel. It placed the æsthetic at the foundation of knowledge and the ethical at the top and demanded the integration of this or that bit of knowledge in the light of the immediately given whole. However, that it paid for its sophistication is evident from the difficulties it encountered. More often than not an attempt was made to characterize its ultimates in terms of its most hated scientific discreetness. Bergson never escaped the biologism of his *élan vital*; Croce fell into the Hegelian fiasco of identifying spirit with human history; Brunschvicg fell short of Spinozistic substance and was content with the onward march of man through his flux of experience. Humanism had its usual limitations. Santayana's Realm of Spirit illumines, enchants, and dies away.

These were the market place brands of philosophy in the year 1924. They were already the history of the last decade, but the discussion of the market place continued. What would come of it? It would be dangerous to prophesy, but history is not complete until an inventory of possibilities is taken. For that purpose, we may return to our analogy. If that is legitimate, we may look forward to a philosophical renaissance in the near future. First, the Platonism of the so-called realists remained; it is the *sine qua non* of all genuine philosophy. Second, the mentalism of the so-called idealists had come to stay. Further, the two could not be mixed. Santayana's *Scepticism and Animal Faith* and the crudities of his behavioristic synthesis is evidence enough of that. The task facing all critical and honest philosophers in the year 1924 was to give some account of induction or the reference of the given to a system, and it was not to be solved by animal faith or divination. Messrs. Russell and Whitehead

used a suggestive device in the *Principia Mathematica* to solve the problem of mathematical induction. The number system, as we know, allows this extrapolation that means so much in all mathematics, but no one could say how or why. The authors faced the problem, admitted defeat; and assumed mathematical induction and proceeded to define the number system in such a way as to insure the validity of the inductive process. The idealists used to employ this device, and built up systems on which one could find perspective and order for the human life of their day. These perspectives and insights are inadequate for our world; to return to them or even to Aristotle and Aquinas is impossible, but with a Kant or a Socrates the sophistries and subterfuges of our popular philosophies would be uncovered and a way made for the courage and insight of a genius who could then make the spiritual affirmation and illumine the whole so that all could see and be wise.

**Bibliography.** Samuel Alexander, *Space Time and Deity* (2 vols., 1920); *Proceedings of Aristotelian Society*, sup. vol. iii: *Relativity, Logic and Mysticism* (1923); A. J. **PHENIX GROUP.** See PACIFIC OCEAN ISLANDS.

**PHONETICS.** See PHILOLOGY, MODERN; and PHILOLOGY, CLASSICAL.

**PHOSPHATE ROCK.** The abundant supplies of phosphate found in the United States offset the utter deficiency of nitrates and potash. These three materials are essential fertilizing substances for agriculture and where not available must be imported. In 1920, the world's production of phosphate rock was estimated at 6,725,215 long tons, of which the

United States produced 4,170,056 long tons. This, of course, was a record production, there being subsequently a marked decline. The phosphate deposits of Florida furnish from 75 to 85 per cent of the annual American output, and are followed by Tennessee and Kentucky. The two main types of phosphate rock are hard rock and pebble. The Florida deposits are mainly land-pebble rock, while the Tennessee deposits are of various types. In the western United States, phosphate rock has been discovered chiefly in Idaho, Wyoming and Utah, where they occur near the base of the Carboniferous. In 1924, the United States had two extensive phosphate reserves, one in Florida and one in the Western States, and there was no anxiety regarding future needs. In fact, high-grade superphosphate had been produced by a copper-mining company from material mined in one of the Rocky Mountain States.

In 1920, over a million tons of raw phosphate rock were exported, valued at over \$11,000,000, in addition to over 80,000 tons of superphosphate valued at \$3,000,000. Nearly all of these deposits went to Europe, chiefly to Germany, Spain, Holland and Belgium, as the United States was the world's largest producer, followed by Tunis and Algiers. In 1913, the sales of phosphate rock in the United States were in excess of 3,000,000 long tons, but it declined during the War until 1915 when there were below 2000 tons with a further temporary decline in 1919. They then rose to over 4,000,000 tons in 1920, which was the banner year for the American industry. The quantity of phosphate rock sold in the United States in 1922 was 2,417,883 long tons, valued at \$10,482,846, as compared with 2,064,025 long tons, valued at \$12,270,070 in 1921. Of all the phosphate rock sold in the United States in 1922, 85 per cent was sold by Florida, whose sales amounted to 2,058,593 long tons valued at \$8,347,522. Tennessee was the next largest producing State, with a sale of 353,309 long tons valued at \$2,107,382 (including a small quantity of brown rock from Kentucky). Idaho was the only western State that produced phosphate rock in 1922.

**PHYSICS.** The discovery of X-rays, radium, the electron, and the constructive theories of the quantum, relativity, and the nuclear atom inaugurated an unprecedented advance in physical science during the first quarter of the twentieth century. Any attempt prior to this epoch to substitute for Newton's laws and Euclidian geometry laws of superior rigor would have been deemed heresy. The quantum of Planck and the relativity equations of Einstein have won their way steadily to a commanding position, the one by the beauty with which it fits observed phenomena, the other by the accuracy with which it predicts quantitatively phenomena contrary to those of classical mechanics. The one began as an empirical necessity, the other as a logical necessity; both have been astonishingly successful in their agreement with the observed facts of nature.

New theories, new tools of research, extended facilities, have stimulated the imagination and the creative activities of physicists so that cosmic theory is now applied to the motions and energies within the atom as well as to the sweep of the entire stellar system in the vast orbits which the stars are now presumed to describe in space. The unit of energy is found, the atomicity of action discovered, and the whole numbered orbits, and whole number relations of atomic energies and spectra are working parts of the crucial attack on the problem of atomic structure.

An astonishing increase in the kind of facilities available for physical research has taken place, and an equally amazing increase has taken place in the magnitude of such facilities. Physics is now cosmic in scope. It takes the crucibles of the sky as experimental laboratories. The stars and planets are dynamic systems, graphic points on the chart of the sky whose coördinates measure millions of light years and whose time scale is equally vast. This gives the physicist observational access to dynamic systems a hundred billion times the size of our own sun, and some of them four or five times hotter. It reveals systems moving through space a hundred times faster than the sun, and in all stages of stellar evolution.

The merging of astronomy and physics has created a new order for the physicist, has within a few years increased his perceptible universe to millions of times its former size. At the other end of the scale, the facilities of the physicist have grown in number and power. The atom gives him a glimpse of forces of the order of a million times those of the highest explosive created by man. For example, when the radium atom explodes it is on such a scale that if the earth exploded with relatively the same proportionate violence, it would drive off a mass equal in size to the United States, leave a crater a thousand miles deep, and never return for its speed would be 12,000 miles per second. The physicist is to-day in the presence of forces hitherto undreamed of.

The production of two million volts, the maximum at this writing, foreshadows the attainment, perhaps surpassing, of the voltages of natural lightning. Model villages are now being experimentally struck by artificial lightning under measured control, in order to develop efficient protection from lightning.

Again electron tubes have been developed with 1000-kilowatt output, using 1800 amperes at 12 volts and a filament thick as a lead pencil. Electron tubes are reaching such proportions that world-wide telephony seems a certainty in the near future, and the physicist is at the same time being given facilities of which he had not conceived the possibility. Again, X-ray apparatus has been developed in recent years to a point where hundreds of thousands of voltage may be used, permitting the body to be photographed in a fraction of a second where a half hour was formerly required. X-ray motion pictures are technically accessible to the physicist. The interior mechanism of machines has been photographed, the inner structure of natural stones, pearls, and even of metals is easily studied by this new-found radiation.

Another and really sensational tool of the physicist is the alpha particle, or the ejected helium nucleus from the radium atom. Easily the most powerful projectile known to science,

it became in the hands of Rutherford a means of disrupting the nuclei of the lighter atoms, thus achieving the first controlled transmutation of the elements.

Another facility recently developed into a powerful research facility for the physicist is the positive ray spectrograph. Thompson, Goldschmidt, Dempster, and Aston have perfected means of projecting and deflecting the positive and negative parts of the atom after disruption so that they leave traces on the photographic plate at distances which may be translated directly into mass indications. This has permitted the discovery not only of masses of different elements, but the different masses of the isotopes of any given element. Neon atoms of masses 20 and 22, in number 90 per cent and 10 per cent respectively, have thus been detected.

The quite astonishing verification of Prout's hypothesis of a common building material with whole numbered multiples of this constituting the atoms of the elements, has thus been achieved since 1915, based upon the thoughts of prior writers who have frequently suggested that the usual atomic weights are not fractional, but average weights of variant atoms. Atoms of the same element varying in mass are isotopes having the same behavior. Atoms of different elements may have the same weight and different behavior—for example, lead and bismuth derived from thorium (disintegration) have atomic weight 208 but display the characteristic behavior peculiar to each element notwithstanding. Positive ray analysis permits the discovery quite unexpectedly of undissociated groups of atoms. The method is now available as a most powerful tool for the physicist.

Devices have been developing for measuring the X-ray patterns as reflected by the space lattices of crystals, and thus disclosing the distribution of the atoms in a crystal. The significance of crystal lattice study as practiced to-day is that the fundamental fine structure of crystals is now possible. The ordinary amorphous or mixed solid has been likened to an orchestra at practice, each player playing the same tune, but at different points in the piece, but that in crystals the atoms, like the players, are all playing the same tune at the same place in the piece, so that at once the melody is apparent. Something like this is the view of the crystal gazer of to-day who is allocating the ions and atoms, and even the electrons to their proper places in the space lattice. Astonishing results have already been attained.

The crystal lattice appears now as dependent upon the number of outer electrons, the form being the same for any given column of the periodic table. Such lattice is geometrically demonstrable as the natural position. For example, the alkali atoms have body-centered cubic structure, since the outer electron and the remainder of the atom form two parts which being respectively negative and positive arrange themselves in space alternately in the elements of a body-centred cube. Likewise the column two atoms, with two outer electrons in each atom form a hexagonal space lattice, the electrons at the angles of a hexagonal prism and the ion at the centre of the prism. Crystal structure thus becomes the same periodic function of the atomic number as the other properties of the elements. Hull expects that this method will

yet reveal the position of the binding electrons in the crystal lattice directly.

As a result of the determination of the intracrystal orientation of the atoms, the crystal forms arrived at give simple and natural explanations of certain physical properties of these substances. For example, aluminium and other face-centred cubic arrangement of atoms (an atom at each angle and at each face-centre) are soft and ductile. The reason is simple. There exist four planes in such cubes in which the atoms are so closely packed that one plane slips easily over the one below without elevating it, hence with minimum change in the attractive distances between the atoms. Less ductile are the body-centred cubic metals (an atom at each angle and one at the cube centre) since they are more fully interlocked and the interatomic attractive distance must change during gliding. This group includes such metals as iron and tungsten.

The hardness of the diamond is quite naturally attributable to the tetrahedral arrangement in which gliding is impossible since the atoms in this type are interlocked in the most stable manner. Shore has found that the diamond under good conditions can support a load of two million pounds per square inch. Hull states that simple cubic salts such as lithium fluoride and sodium chloride do not permit gliding since the atoms are bound electrostatically, each ion being surrounded by six opposite charges.

**Relativity.** The year 1915 was notable for the publication of Einstein's (q.v.) short but epoch-making paper on his generalized theory of relativity. This, with his paper published in 1905 on the special theory of relativity, has wrought the most profound advance in physics since Newton. The finitude of the material universe, the derived non-objectivity of time and space, the meaninglessness of absolute motion, the effect of gravitational fields on light and other radiant energy, the equivalence of mass and energy, the acceptance of time as a fourth coördinate, the introduction of the relativity effect of the finite velocity of light into physical equations, and the establishment of purely relativity equations—all these were so new to the physicist who had not followed the course of philosophical or mathematical theory that skepticism, even ridicule, greeted the new theory set forth by Einstein.

To demonstrate his theory, Einstein selected three necessary results of the theory which might be tested by observation, each of them contrary to the classical laws of mechanics and inexplicable under classic physics. He even predicted these results quantitatively by the simple use of his relativity equations unmodified by special assumptions. The three predictions have now been confined by observations of unquestioned precision. The agreement is better than 1 per cent. Classic physics was shown to have failed in crucial tests. Einstein's view that time and space are abstract derivatives of reality and in themselves unable to control or influence anything is certain to have a profound effect in recasting physics. At the same time, space and time are made joint coördinates of the four-dimensional continuum for the graphic plotting of an event.

**Testing the Relativity Theory.** The first test of the relativity theory was the mathematical determination by relativity equations of

the full value of the rotational precessional of the perihelion of the planet Mercury. The rotation is in the direction of motion of the planet and was inexplicable according to Newton's laws by an amount equal to 43 seconds of arc per century. The Newtonian failure was notable, small as it was. Using relativity equations without special assumptions, Einstein computed the true rate of rotation of the perihelion of Mercury to within one second of arc per century. His success was astonishing and furnished the first confirmation of his theory.

The relativity effect on the apse of Venus is too small to observe since the orbital eccentricity is too small. The relativity effect of like character has been observed for the planet Mars but observational confirmation of the exact amount must await fuller data. In the case of Mercury, Einstein amended the inverse square law by changing the square or "second-power" of the distance to read the "2,00000016 power" of the distance. Slight as it is, it affords confirmation of the theory which is destined to play a reorganizing part in physical theory. For example, the fine structure of spectrum lines involves the change of mass resulting from relativity effects on the elliptical orbits of the electrons by which the perihelion increase in mass with increased speed alters the frequency of the electron revolution about the nucleus. In other words, relativity has, perhaps, one of its strongest confirmations in the structure of each spectrum line, since the fine structure is a graphic portrayal of the actual effects of relativity.

A second triumph even more spectacular was the confirmation of Einstein's prediction that gravity affects light and that starlight passing the sun's disk at grazing incidence would be deflected on his theory by an amount twice the value to be looked for from classical theory. Maxwell long before had shown that light waves should exert pressure. Years later experiment confirmed the prediction. The doctrine of conservation of momentum implied that light carries moving mass. The wave front having momentum and exerting a pressure is in a sense "temporary matter" which might be affected by gravity.

This was put to the test at the eclipse expedition of May, 1919. It was only at a total eclipse that the stars could be photographed to test the theory by recording their apparent position. If the photographic images near the eclipsed sun during totality showed displacement equal to that predicted by Einstein—double that called for by classical mechanics—it would be strong evidence for the relativity theory. But if the amount was one-half that predicted by Einstein, then Newtonian laws might account for the displacement.

Decisive success came on May 29, 1919, when at Principe light from near-by stars was found deflected by the sun almost equal to that predicted. At Sobral the deflection found was slightly in excess. Campbell in 1922 in the most careful eclipse observations yet made found his observations as finally adjusted gave 1.75' and agreed within about a half of one per cent with the Einstein prediction. The mass of Jupiter is great enough to produce a perceptible deflection and an occultation of a star by this planet may yet be a favored method of studying this phenomena. Einstein had said that a hundred experiments might support his

theory but that one adverse result would destroy it.

The third prediction to be verified was that in the gravitational field of the sun light waves would be lengthened—for example, about 0.008 Angstrom unit for blue light of wave length 4000 Å. Grebe and Bachem, however, in 1920 reported that they had detected a lengthening equal to the recession of the light source 0.56 kilometer per second as compared with Einstein's prediction that it would equal a recession of 0.634 kilometer per second. An atom in the sun was thus shown to vibrate at a slower rate than a similar atom on the earth. St. John, at Mt. Wilson Observatory, reported to the National Academy, at its 1924 session at Washington, that he found confirmation of this predicted effect in an elaborate series of measurements of the shift of spectrum lines.

The abstract mathematics used to enunciate Einstein's theory were such that few physicists could follow the reasoning. The verification, however, of three predictions contrary to classic mechanics could be comprehended by all but could be ignored by none.

In the words of Planck, Einstein's theory "surpasses in boldness everything previously suggested in speculative philosophy and even in the philosophical theories of knowledge," and that "the revolution introduced into the physical conceptions of the world is only to be compared in extent and depth with that brought about by the introduction of the Copernican system of the universe."

**Trend of Modern Physics.** Modern physics has been the sphere of so many and such fundamental series of discoveries that there was pressing need for a complete restatement in terms of fundamental elements. Slowly through the centuries, the consequences of these elements have become simpler as identities were found. Parallel to this the consequences of the interaction of these elements have become more complex. Man's control of these elements has become so great that to-day he can take the electron from an atom and study the light produced when another electron takes its place. This example is a type and a forecast.

The trend of physics is steadily toward the complete control of the ultimate elements of matter and of energy, the ultimate units with which physics has to deal. To restate the fundamentals of physics does not mean that we have completely mastered either the elements or the principles governing their interaction. A true restatement merely implies a more fundamental basis. The super.structure is yet to be built.

The success of the new physics based on the fundamental units of matter and energy foreshadows greater triumphs to come. The crucial fact is the identity of matter and energy from which follows the identity of the electron and the unit electric charge, so that matter and energy, the basis of action, have one and the same essence. The electron thus becomes the focus of the vast movement in science and philosophy, a twofold movement of human thought seeking the ultimate unit of matter on the one hand and the ultimate unit of energy on the other. The two paths led to the same ultimate unit—the electron pair.

Exactly as matter has been unified and the elements ranged in an evolutionary sequence consecutive and alike in essence, so radiation from

electric waves (gamma)  $2 \times 10^{-10}$  cm. to those of radio wave lengths has been unified into a continuous spectrum of 55 octaves. Fluorescence, which is frequency transformation of light waves, seems destined to give the means of transforming any frequency of electric waves from the shortest gamma to the longest to any other desired frequency. This is the analogue of the transmutation of the elements. It is true that neither is fully at hand, but with the fast perfecting knowledge of the laws and mechanism of radiation, it seems fair to expect great progress toward the protection of any element from any other and of any electric waves to others of any desired frequency.

The knowledge of critical frequencies and critical voltages is rapidly becoming more definite. This will give the physicist and the chemist the means of initiating and controlling chemical reactions otherwise impossible of human control. The duplication of the chlorophyllian reaction by means of ultraviolet radiation is a significant experiment forecasting great achievements. That sugar can be made directly by photosynthesis from moisture and carbon and ultraviolet radiation seems incredible, yet this is credibly reported by Berthelot. In fact, Perrin and others suggested that all chemical action is by means of radiation, and that without the proper radiation, a chemical reaction is impossible.

**Atomic Structure and Theories.** That action should be found atomic was quite unsuspected and is still inexplicable; that the least common multiple or cosmic unit of action should be measured to within one part in six thousand and take a dominant place in the computation of atomic structure and spectra as well as in other branches of physics brings us to the point where we are almost ready to say that we have reached at least the ultimate units of matter and energy and action in the broadest sense. Expressed in energy units based on the second, gram, and second, the numerical value of Planck's universal constant of action is  $6.555 \times 10^{-27}$  erg seconds.

Recent physics has witnessed the "electrification" of the atoms, and such properties as tensile strength and resistance to compression, which have been called "mechanical" must be regarded as electrical. Tensile strength is the attraction between ions, resistance to compression is the repulsion of like charges or like poles of magnets. The structure of the atom now disclosed gives a vivid picture of the mechanism and mode of operation of the "properties of materials."

Now that energy is known to have momentum and inertia, we are free to revive the *energetik* of Ostwald, and with Le Bon and Einstein conceive nature as a phenomenon rather than a thing and to regard atoms as systems of energy rather than dead inert matter swept by chance forces into fortuitous concourse called material systems. Nor is this new *energetik* a mere idea, we can measure the increase in mass with velocity, witness the transformation of energy into mass and mass into energy, and can compute the energy equivalent of mass of any element. If mass is all energy, then a gram of any kind of matter has as its energy equivalent 90,000,000,000 ergs of energy, that is the mass multiplied by the square of the velocity of light.

**Radiation and Pressure.** That the mass of radiation which causes its pressure is not a

mere abstraction of academic interest only, is seen in the theory of giant stars and the powerful rôle which radiation pressure plays in the architecture of stellar evolution and especially in limiting the growth of mass to approximately  $10^{35}$  grams, the mass at which radiation pressure begins to far exceed the inward pull of gravitation. Practically all the stars are between  $10^{33}$  and  $10^{34}$  grams, where ether pressure of the soft X-rays just begins to dominate the situation. Knowing the mass, it becomes possible to compute the highest temperature through which an old star has passed, and knowing its size also, it becomes possible to tell what stage of its evolution it has reached.

In the days of Laplace gravitation was assumed as the only building force of the cosmos. His famous nebular hypothesis received overwhelming support by the discovery during the past 50 years of the spiral nebulas numbering perhaps millions. About the middle of the past century the pressure of light was postulated from theory, and later confirmed. In the heart of a star the pressure of light is now known to sustain most of the vast weight of the star's mass.

During the eclipse of 1922 it was found that the sun's atmosphere was being driven away from the sun with a speed that increased steadily. Such an increase could only be due to an accelerating force constantly at work. This force was promptly recognized as light pressure. The same effect was observed when Halley's comet was seen to disrupt, a small portion of the head breaking off. The lower momentum and smaller size of the detached particles caused them to be driven away from the sun relatively to the head of the comet. Gravitation and the pressure of radiation are now recognized as jointly determining the architecture of stars and stellar systems.

Nothing in the history of science compares with the sensational attack upon the problem of the structure of the atom and the amazing results which have been obtained during the past few years. They open up a new universe, infinitely small, within the atom—yet coextensive with the great universe about us. Mendeleev, Shenstone, and others had imagined an infra-cosmos in which atoms were planets and molecules were stellar systems. The atom is, in fact, now known to be a solar system, the smallest constituent of which is perhaps a trillion times the volume of the entire atom. The hydrogen atom, the simplest of all, was quite naturally the first studied, and as suggested by Prout it turns out to be the unit of which all later atoms are built. This atom is one ultimate unit of positive electricity around which circles one unit of negative electricity. As early as 1881, Stoney and Helmholtz had independently suggested that electricity was atomic in structure. Stoney had already named the atoms electrons.

**Development of Atomic Theory.** Hundreds of notable names suggest themselves as playing parts in the steady stream of atomic knowledge which formed the atomic theory as it appears in 1924. Faraday discovered the law of electrolysis, Berzelius had developed his electrochemical theory, and Arrhenius the theory of electrolytic dissociation. Then came Lenard, J. J. Thomson, Crookes, and others concerned in disclosing the electron itself as a discrete entity. Curie brought radium to light from

which electrons and helium nuclei were ejected and gave a dynamic example to the physicist of disintegrating atoms. Soddy advanced the thought, foreshadowed by Crookes, that the atoms might vary in weight even for the same element and examples were afforded in radioactive transformations. Variant weight atoms of the same element were called isotopes. Thomson and Aston perfected the means of studying them and the latter provided proof that the atoms, except hydrogen, had integral atomic weights.

At this juncture Planck's quantum theory became in 1900 an essential factor in the field of radiation. Balmer, Rydberg, and Rits had given an equation for computing the spectral lines of the Balmer series. The outstanding question remained: why were special favored frequencies alone possible, say, in the Balmer series of hydrogen? On classical assumptions and electrodynamic theory no explanation was forthcoming.

Planck found complete agreement on the assumption that the energy of the vibrating electrons could not change continuously but always in whole numbers of what he called "energy-quanta." Thus Planck's constant took its place as the factor which multiplied by the frequency gave the energy quantum. This latter relation was pointed out by Einstein who based upon it his theory of the photoelectric effect. Not yet, however, was it possible to reconcile interference phenomena with the theory of quanta, and it is just such phenomena that reveal the meaning of the frequency thus computed. Bjerrum's prediction, verified by Eva von Bahr, that rise in temperature would cause spectrum lines to split up into discrete components became a vivid proof of the reality of the quantum.

Then came Rutherford's development of Rantkin's suggestion and Nagaoka's theory that the nucleus of the atom would be found to be positive, since the electrons were negative. We can fairly attribute the establishment of this fact to Rutherford in the year 1911.

**Bohr's Theory.** Two years later, in 1913, a young physicist at Copenhagen, Niels Bohr, attempted the final step of postulating certain conditions which might account for the stability of atomic structure and the properties of radiation from the atoms in accordance with the observed relations. The essence of this is that certain favored orbits alone could exist and that these bore such relation to each other that the radii are proportional to whole numbers. For simplicity suppose these represented by circles. The favored series within which alone stability existed were circles having radii  $1^2, 2^2, 3^2, \dots, n^2$ . An electron might jump only by whole number intervals. No radiation takes place while an electron is moving in one of these orbits. If an electron jumps from one of these to another, the difference in energy is equal to Planck's constant times the frequency.

Bohr's two postulates gave a basis for the stability of the atom, and for the discrete frequencies which we call spectral lines. A second step assumed that these discrete orbits were radial quanta and that there existed also ellipses of azimuthal quanta, both of which together determined the size and shape of the orbit of the electron.

Bohr borrowed from astronomy the concepts of orbits. He showed that for hydrogen the spectral series (Balmer, for example) could be

computed from theory assuming Coulomb's law and the discrete stable orbits (nonradiating). For example, the hydrogen alpha line of the Balmer series of hydrogen represents a release of energy equal to the difference between the energies of the 3d orbit and the 2d orbit having equivalent radii respectively  $3^2$  and  $2^2$ , or ellipses of similar energy content.

The characteristic of the Balmer series is that the orbit of arrival is No. 2, the orbits of departure being respectively 3, 4, 5, 6, . . .  $n$  . . . theoretically on to infinity. Naturally the electron fall from infinity to orbit No. 2 would give the maximum energy release—just equal to the ionization potential. The latter is the voltage required to give electron speeds sufficient to drive an electron from an atom permanently. The ionization potential becomes one of the great basic constants affecting not only spectroscopic theory but all chemical reactions as well. If the ionization potential is divided by the Planck's constant ( $6.555 \times 10^{-27}$  ergs) the result is the frequency of the shortest wave emitted by the atom in the Balmer series. Such very simply was Bohr's theory. It has had many brilliant confirmations, notably the work of Sommerfeld in accounting for the fine structure of the spectral lines, in 1916.

In 1914, Lyman discovered the series in which the orbit of arrival was Orbit No. 1. Paschen had long before found the spectral series for which the Orbit No. 3 was the orbit of arrival. In 1922, Brackett observed several lines of the series terminating in the fourth orbit. The simplicity of the theory may be stated thus: all emitted or absorbed radiation is produced by change of orbit. For hydrogen the difference of the inverse squares of the orbit numbers gives the ratio of their frequencies. A falling electron emits, a departing one absorbs energy. The mathematical treatment of the hydrogen orbits is now relatively simple. Such treatment of the helium orbits is still impossible, except for special cases of assumed structure. The problem of three bodies (hitherto insoluble) now assumes great importance in the further study of the atom and its spectra.

At this writing (1924) the outstanding achievement in this field is the closing of the gap in the entire electric wave spectrum by E. L. Nichols. Thus the shortest gamma ray and the longest used in radio are united into a single series constituting the electric wave spectrum and comprising the gamma rays, X rays, heat, light, and radio—all separately named as their unity had not been proved until recent years. To-day the unity of the electric waves from  $2 \times 10^{-10}$  cm. to the maximum radio waves is as complete as the periodic system with the difference that while the properties of all the elements are known, five are still missing from the series of 92 believed to be possible under observed conditions.

**Spectra.** The spectra, then, become a means of studying the energy and structure of the atom. The emission spectra are of various kinds which it is not the purpose here to discuss except to say that the eccentricities of the elliptical orbits appear to give rise to the so-called principal, diffuse, sharp, and fundamental series in conjunction with the Lyman, Balmer, Paschen, and Brackett series referred to above.

The complexity of the later elements of the periodic system gives rise to corresponding complexity in their spectra. A method of approach

has been devised by the determination of spectral terms on the theory now established that each spectral line represents the difference of two spectral terms in accordance with the quantum theory and the Einstein relation  $E = h\nu$ , whence  $E - E' = hc\nu'$ . The work of Catalan, Meggers, Walters, Kiess, and others carries the analysis of the spectral frequency relations into the most difficult elements of the periodic system, even including the most complex spectrum, that of iron. The similarity to the hydrogen spectrum is shown in that the terms in each series may be given by the expression  $K/(n-a)^2$ ,  $K$  being the same constant used in the case of hydrogen,  $n$  the term number, and  $a$ , a special constant for each series.

Bohr then regards the above relationship as ground for viewing spectra as "the last step of a process whereby the neutral atom is built up by the capture and binding of electrons to the nucleus, one by one." Spark spectra are now known to be due to ionized atoms and represent the last step but one in the formation of the neutral atom by the successive capture and binding of electrons, the usual arc spectra representing the last step. We have thus the basis of studying the evolution of the periodic system of the elements—a field which at this writing is one of intense interest and activity.

The impact of electrons at controlled speeds has become a means of throwing light on the energy required to change the state of energy of the atom and experimentally checking up the magnitude of the spectral terms. Frank, Foote, Mohler, and others have done notable work in this direction, as related in Foote and Mohler's brilliant work *The Origin of Spectra*.

In 1914, Stark discovered a remarkable splitting up of the hydrogen lines when subjected to an electric field. Two years later Schwarzschild and Epstein both succeeded in accounting for this effect, and in 1917 Sommerfeld and Debye worked out the explanation and details of the Zeeman effect on the basis of Bohr's theory of atomic orbits. In 1922, Stern and Gerlach split a stream of atomic silver into two parts, showing that the single outer electron in its rotation makes each atom an electromagnet, and when passing a sharp-edged magnet repelled like or attracted unlike polarities, making two streaks as graphic demonstrations of the Bohr theory.

These three astonishing confirmatory achievements combined with that of Sommerfeld account for the fine structure of spectral lines on the basis of the relativity effects in the elliptical orbits of departure and arrival. The computed and observed Stark effects on the hydrogen gamma line (for example) are in striking accord both as to position of the components and their relative intensities, both of which facts are confirmatory of Bohr's theory of interorbital transitions of electrons. Kramer has given the details from the standpoint of the Bohr theory.

Bohr himself, on the basis of spectra and other considerations, has published a summary of the electronic distributions on each atom of the periodic system. J. J. Thomson (in 1904) had suggested that the electrons are arranged in groups concentrically, each new group representing a new period of the periodic system. Kossel (1916) developed the idea, and G. N. Lewis and I. Langmuir, basing their speculation on the possible cubic outer grouping of Column VIII atoms of the inert gas group, postulated

statical equilibria of the tetrahedral atoms of Column IV with the electrons at the corners of the tetrahedron.

Valency on this view became the number lacking to complete the cubic configuration. The general applications and extensions of this view are now available in some of the general texts and will not be recited here. The situation in 1924 was remarkable. The curve showing the relation of square roots of the spectral terms has been studied intensively by Siggbahn, who continued the fundamental researches of Moseley. The astonishing linearity of the X-radiation of the  $K$  and  $L$  orders enabled the prediction of the existence of Atom No. 72, and its subsequent discovery in zirconium, titanium ores, and later its isolation in quantity. This new element was named by its discoverers "Hafnium" after the ancient name for Copenhagen "Copenhavn." The workers in the atomic field are many, and the detailed works are found in every physical journal, for the subject in 1924 had become the outstanding problem of science, full of promise for discoveries of the most important and probably epochmaking kinds.

Whittaker pointed out a possible model of the atom capable of unreversed action upon a moving electron passing towards and through an atom and which demands all exchanges between the kinetic energy of electrons and radiant energy to conform to the Planck quantum equations. The electrons in each atom comprise two groups or magnetic systems, the inner has moment and may turn in an applied field, the outer fixed relatively to neighboring atoms takes its proper place in the space-lattice of the crystal. As an example, Ewing made a model with eight fixed magnets pointing along the diagonals of a cube, their centres being at the corners of the cube. An approaching electron may be turned back (inelastic collision) since a rotating magnet takes up its force and causes it to recede giving back the energy as the rotating magnet is again brought to rest. If moving with sufficient speed or energy the electron will move clear through the atom but its energy is transferred to the excess over the critical amount, i.e. the quantum. The iron atom may thus be assumed as having 2  $K$  electrons surrounded by three concentric parallel cubes, an electron at all corners of three cubes, making 26 electrons in all corresponding to atomic number 26.

Industry begins to recognize the utility of fundamental physics. A striking example is the recent progress in the study of the metals by means of the new atomic theory and X-ray analysis. These have revealed that the crystal of a metal consists of atoms arranged as regularly as the spacing on a checkerboard. For the more complex sizes and shapes of atoms the forces naturally cause characteristic space-lattices. If this lattice is made up, as in an alloy, the solute atom causes some distortion. Rosenheim has advanced the theory of "the substitution of the solute atoms for an equal number of the solvent atoms in a solid-solution lattice." The fertility of this conception can only be suggested, but its basis in fundamental physics gives promise of a new study of the structure of alloys which hitherto has almost resisted attack.

One outstanding aspect of the new physics is that "properties" are becoming based upon

"ultimate" units—electrons, the electric field, Planck's constant, definite radiation frequencies, critical potentials, the velocity of light. Upon the basis of these, physics has begun the synthesis of physical forms which we call material bodies. With great rapidity the space-lattice is being determined by observation with X-rays, and in turn being computed from the constants of the electronic charge. It is not too much to say that this method of approach has given the new physics as nearly a fundamental or ultimate basis as we could without present knowledge conceive. The conviction is deep and insistent that physical science is fast converging upon the complete control of matter and energy which will give the physical basis for a new social order.

Harkins gives a periodic system of the elements based on the  $H$  and  $He$  atoms as units in building up the positive nuclei. Elements of even atomic number (carbon, oxygen, neon, magnesium, silicon, sulphur, argon, calcium, scandium, chromium, iron) all have atomic weights divisible by 4 (the atomic weight of helium). The positive nucleus of helium is the most stable next to the hydrogen nucleus, hence is well fitted as a stable building unit for more complex atoms. Almost direct dynamic confirmation that helium is such a building unit is found at the other end of the periodic table in uranium (atomic number 92) which disintegrates by losing one alpha particle.

Radium and its successors also progressively disintegrate by ejecting helium atoms, reducing from time to time the atomic weight by 4 with each ejection. So much for elements of even atomic numbers. Elements of odd atomic numbers, according to Harkins, are probably compounds of helium and hydrogen, computable by a simple formula. The even-numbered elements are, however, naturally more stable, as evidenced by the fact that 10 elements of even atomic number make up over 97 per cent of the meteorites and that the atoms of the even-numbered (helium) series are 127 times more abundant in the iron meteorites than the atoms of the odd-numbered (helium-hydrogen) series.

An event of truly strategic importance in physics was Rutherford's success in breaking down the positive nucleus of the lighter atoms. Using the alpha particle (helium) from radium  $C$ , Rutherford had a projectile with a velocity of 19,000 kilometers per second; 20,000 times that of a rifle bullet. He had available in a single particle a stress-producing energy of 5 kilograms of weight at the closest approach to the nuclei encountered. The momentum at the high velocities is such that a gram of helium at such velocity would have a striking energy equal to that of a 300-ton projectile at a velocity of a kilometer a second.

With this projectile he bombarded hydrogen atoms, and in a relatively few of the total encounters between the alpha particle and the hydrogen atom, a head-on collision occurred, in which the momentum of the former was transferred to the latter, giving it a range four times that of the alpha particle. This was quite in accordance with theory. Unexpectedly, however, he found that in pure nitrogen the particle produced ranges as long as those produced in pure hydrogen. As the nitrogen atom has several times the weight of the helium atom, by control experiments he eliminated all explanations except that the nucleus of the ni-

trogen atom had been broken up by the swift alpha particle and a hydrogen nucleus detached from the nitrogen nucleus. The latter presumably consists of three helium and two hydrogen atoms (making the total atomic weight 14, that of nitrogen).

The long range atoms were detected by absorbing screens of metal which stopped the alpha particles but permitted the higher speed hydrogen atoms to pass to the scintillating screen. In any case, a new method of research has met with success and for the first time the positive nucleus has by intent and under control broken up. Other light atoms have yielded to similar bombardment.

Soddy has published a series of interesting papers summarizing the transmutation in radioactive changes, the disintegration of radioactive material, ultimate products, radiations, average life, branch series, chemically non-separable elements. He concludes that radioactive changes are quite distinct from the usual chemical changes.

Chemical reactions are accelerated by rise in temperature, being doubled in rate for each 10 degrees rise. The reaction would thus be 10,000,000,000 times faster for each elevation of 300 degrees. But the radium disintegration remains absolutely unaffected by such change. Heat, light, magnetic field, high concentration, or extreme dilution produce no effect on the rate of radioactive disintegration. The particle is ejected with prodigious speed, 20,000 kilometers per second, from the radioactive atom. This is the helium nucleus (mass 4) but niton, the resulting product, recoils with a velocity of several hundred kilometers per second. The alpha particle passes 100,000 aluminium atoms before it is stopped. The initial energy of such a projectile is more than 100,000,000 times greater than that of a molecule in ordinary thermal agitation. Individual energy of a particle is  $10^{-5}$  erg.

It is characteristic that unsuspected indicators of phenomena are found in this interchange of scientific thought. Estimates of the age of the earth are based upon the atomic lead and its percentage in uranium ores. Knowing the rate per year at which the lead is accumulating from the final stage in the disintegration of uranium atoms, the age of the ore is readily computed. The figures check with good concordance with the age of the earth (forming of the ocean beds) as estimated by six other methods. Apart from its unique interest, the method is capable of effective use in geological theory.

**Astronomy and Physics.** Astronomy in turn has gained as well as given in its contact with physics. Belot holds that of the forces which dominate attraction in the architecture of the universe, gravitation blends all into one mass. The dispersive forces prevent agglomeration, such as molecular attraction, gas pressure, radiation pressure, electrical and electromagnetic forces. Crystalline growth operates against gravity as do many other forces of growth, but attraction does not produce the primitive dispersive impulse. Attraction ensures stability but the architecture is the resultant of all the incident forces.

A large-scale example of light pressure observed by Bell is shown in Saturn's rings. These rings are thin strata of bodies of meteoric size, surrounded and permeated by dust invis-

ible except through deep layers. This dust is wind driven by gravitational waves and the pressure of radiation which moves the particles back and forth through the sunlit side to be seen below when light filters through. The acceleration due to solar radiation is, for particles of micron size, nearly 350 kilometers a day, a demonstration of Maxwell's theorem on a colossal scale. According to modern physics the mass of all stars rests upon radiation pressure. For example, 95 per cent of the mass of sun is supported by the radiation pressure of the intense X-rays generated in the heart of the sun under gigantic gravitational pressures. See ASTRONOMY.

**Solar Physics.** Solar physics is the object of particular study among other things, on account of the correlation which Abbott and others are establishing between solar variations and terrestrial meteorological phenomena. Angenheister finds the sun hotter at sunspot maxima. These show strong vertical movements, cooler layers sinking, hot masses rising, increasing the radiation. Jupiter and Encke's comet varies in brightness with the sunspot cycle, the maxima coinciding. Evidently factors other than temperature at spot maxima cause the striking 11-year cycle in tree ring growth. Mean air temperatures are at least one-half degree lower at spot maxima. The influx of cool air from higher latitudes is greatest at spot maxima, as shown by the records of the winds at Samoa. Trade winds at that point appear to be 10 per cent more frequent. The frequency of cirrus clouds also parallels the spot cycle. The air at spot maxima absorbs 0.05 calorie per square centimeter less per minute and the mean temperature of the earth drops a fraction of a degree. Abbott, Fowle, and Aldrich give 1.94 calories per square centimeter per minute as the solar constant, based on 20 years' observations.

The work of Douglas and others in correlating the variation in growth of the annual rings in trees with the sunspot cycle has been an outstanding achievement of recent science. So well advanced is this correlation that the particular years in which a tree was planted and cut down can often be deciphered from the characteristic pattern of the curves of ring growth sequence. Petrified forests may yet disclose prehistoric weather cycles and tell much regarding solar radiation in geologic times. The subject is fascinating. Every lumber camp becomes a potential solar and terrestrial weather observatory, and every tree has its tale to tell of the sequence of weather changes through which it grew. Douglas describes observations of cloud formations taken from an airplane including record of temperature within the cloud and the surrounding air and the dimensions of the cloud formation. A new field is now open for airplane work in collecting data with suitable autographic instruments.

Jeffreys accepts the tidal theory of the origin of the solar system, showing that mere condensation could not produce the system. His results agree well with the age of the earth as determined by its radioactive constituents. He also shows that no satellite less than 1000 kilometers could have been gaseous since the mass could not hold itself together in gaseous form. He assumes that the asteroids were formed from a primitive planet broken up by the tidal action of Jupiter.

Michelson has obtained the first measure of the diameter of a star—alpha Orionis—the bright red star Betelgeuse of magnitude 0.7 in the constellation of Orion. The result is startling, for it gives a diameter 300 times that of the sun, or a volume 27,000,000 greater. He later found that alpha Scorpionis—Antares—had a diameter 500 times that of the sun or a volume 125,000,000 times greater. The principle is to admit the starlight by two parallel slits in the field of the telescope. The diffraction pattern formed depends upon the distance apart of the slits. For each size of star disc there is a definite distance apart for the discs at which the diffraction pattern disappears owing to the optical interference effect in the waves forming the two sets of diffraction fringes. By adjusting the slits until this occurs and measuring the distance apart, the angular diameter of the star disc is computed by simply multiplying the wave length used by 1.22 and dividing the distance apart of the slits.

A striking application of Bohr's theory comes from astronomy. Plaskett found in Class O stars spectral lines of ordinary hydrogen and of helium atoms which have lost an electron. These nuclei have only one satellite each. Bohr has computed the orbits and the positions of the spectral lines. The heavier helium nucleus changes the orbital frequency by the computed amount. From the separation of the lines the electrons and nuclei reveal their relative masses. Plaskett has found a star (22,000° C.) so hot that helium atoms are all ionized.

"Invisible sunspots" were studied by Hale and Ellerman. Beginning with the theory that the normal type is the "twin bipolar," 970 spots showed the percentage of bipolar spots to be 61 per cent. In seeking companions for single spots local magnetic fields were discovered near the spots. The first such field discovered had the polarity and position usual for the following component of a regular bipolar pair. In several cases, invisible fields gave rise to spots, and in cases where spots had disappeared traces of magnetic fields were still detected. If the vortexes of a bipolar group penetrate deep enough they must certainly unite to form a half ring.

**Light Studies.** Ives revives interest in the firefly, stating that if the light of the firefly were spread over the entire visible spectrum it would still excel many times the efficiency of any artificial light source. It will be recalled that Coblentz found the luminous equivalent of radiant energy as about 50 candles per watt. Colorimetry, for which physicists like Priest and others are laying basic principles, is fast taking a high place as an exact science.

Harvey has completed the first big step toward the production of artificial light from organic material. He obtained a candle power from 30 square inches of luminous solution of luciferine. Dubois and Harvey have extracted "luciferose and luciferine" two substances supposed to be the cause of animal light. Luciferine emits no light on agitation, but luciferose bursts into a momentary brilliancy if shaken. When mixed the two substances emit continuous light, apparently requiring oxygen or moisture.

**Acoustics.** Applied acoustics had great opportunities in the War. It was active notably in the production, transmission, and reproduction of sound, exemplified notably in the use of acoustical devices for detecting enemy planes,

locating enemy batteries, and discovering sappers at work underground. Huge parabolas used as reflectors with sensitive sound receivers detected planes approaching Paris 30 miles away. Apparatus was promptly devised to locate enemy batteries with high precision. Sensitive geophones effectively disclosed enemy mining, and sound ranging was developed to a point where the length of the type of gun had to be taken into account so accurate was the location of enemy batteries by sound-wave triangulation. Battle firing permitted the study of sectors of sound, and speeds of concussive sounds were measured as high as three kilometers per second and pressures as great as 300 atmospheres. The gradient was so steep that 30 meters from the sound source the speed dropped to 400 meters and the pressure to two or three atmospheres.

**Radio-Communication.** The faintness of radiotelephone sounds even at moderate distances led to the development of amplifying electron tubes. The uses of electron tubes are unique in the annals of invention and are in a state of rapid development at this moment. Their design and construction command exacting theoretical and experimental physics. Research engineers have developed the amplifier which can magnify sounds trillions of times, in fact, to the point where their volume cannot be endured and where structural materials would collapse if the sound were continued. The microphone is now supersensitized and connected to an amplifier permits the human heart beat to be heard across the ocean.

Radio-communication has awakened research and invention the world over both by experts and amateurs. The Armstrong regenerative circuit is an example of amateur work of notable importance. Applied physics will be the factor in eliminating strays, static, distortions, and this result combined with the perfecting of amplifying tubes will bring a new era in radiotelephony.

Jewett reported that it was possible to transmit and amplify by radio without distortion. There remained the perfecting of the reproduction of sounds at the receiving end without distortion.

The application to the inaudible sounds of the insect world, too faint or of too high a frequency to be normally heard, opens up dramatic possibility of vastly extending aural perception much as the microscope and telescope and camera have extended our vision to the infinitesimal, the infinitely remote, and to the vast gamut of radiations which are too long or too short to be directly seen by the eye.

The study of "sound spectra" of musical instruments awakened an interest which should soon be fruitful in practical application. This analysis gives the respective wave lengths and relative intensities of the simple sounds component of any musical note revealing quantitatively the causes of the characteristic quality of the sounds of musical instruments.

Physics in 1924 had before it the task of studying the entire range of molar vibration frequencies and amplitudes. Such a study would unify molar waves in a manner similar to the just completed unification of electric waves. Ellerman's "hydrogen bombs" discovered in the solar spectrum give evidence of prodigious explosions in the sun. Volcanoes and earthquakes also give rise to vibrations which

shake the entire globe. From such vibrations to those too fine to be yet perceptible is a virgin field for acoustical research and experiment.

**Rhythm and Resonance.** Already at Munich the technical physicist is studying vibrations in connection with mechanism with a view to enhanced efficiency in the transmission and use of mechanical power. The possibilities of utilizing resonance are just beginning to be adumbrated. Every object, every cavity has its natural period or resonance wave form. Such form may be complex. In other cases the note may be simple. An archway, tradition tells us, may collapse under the continued playing of the keynote of the arch on an instrument like the violin. The rhythm of a regiment will vibrate a bridge to the breaking point. The automobile at different speeds shows resonance at various points each characteristic of a given speed. So, too, vibrations are being applied for physical ailments.

As yet the entire field, from earthquakes to the as yet imperceptible oscillations of the insect world, are in an empirical, even legendary state. With the supermicrophone and amplifier the study of the sound spectrum of a given object or cavity set in vibration or resonance becomes possible. Any characteristic tone is thus reproducible by giving the harmonics their proper relative intensity. The field is thus wide open for the creation of a harmonic synthesizer capable of producing sounds of any possible tone quality or frequency.

**Reproduction of Sound.** Physical research has almost perfected the phonograph to the point where the distinction between the original rendering and the reproduction from the shellac disc is difficult. Astounding developments in this field have resulted from the application of acoustical physics, theoretical and experimental, to radio. The reproduction by means of a crystal is perfect but faint. The reproduction without the crystal still shows distortion and alone remains the incomplete link to the world-wide transmission of any sound, and its amplification without distortion to any volume. The field of acoustics has been furnished by physicists with precision tone producers, that is the production of clear monotone notes of a predetermined frequency.

**Music.** Seashore has measured the expression of emotion in music. He gives the types of variants from the cold non-emotional and mechanical production of tones to the highly artistic emotion on the basis of pitch, intensity, duration, and extensity, as they are combined in timbre, rhythm, consonance, and volume. The analysis is a behavioristic study of musical expression and should throw light on the basic laws of emotional expression.

**Apparatus for Navigation.** Acoustics has taken on new activities in such fields as submarine signaling. Eckhardt has devised a combination of submarine sound signals which are made to actuate a radio relay at several points on the shore. The radio relay signal reaches the ship almost instantly, the elapsed time giving the distance from each shore station. The relays give the exact location. The United States Navy by the use of echo detected by radio permits the sounding and the plotting of the ocean depths and the mapping of its profiles and contours. The "phonodeik" designed by Miller has opened up the subject of sound spectrum and given it a quantitative basis.

**Modern Physical Science.** The merging of the fields of astronomy, chemistry, and physics resulting from the invasion of physical laws, research methods, and the instruments of the physicist has been momentous for all three sciences. The extension of mathematical formulas into new fields is characteristic of present-day physics. Highly specialized formulas are found to hold good in fields foreign to those in which they were developed. Frank shows that the solution of the problem of guiding aircraft in minimum time with any arbitrary wind distribution involves an identical case to that of the passage of light rays through moving media. An example of the latter is the motion of the earth through the ether in which the ether wind relative to the earth is determinate by vector analysis. Aëronautics (q.v.) and aviation physics emerge as subjects of permanent interest, and meteorology (q.v.) has become of most practical concern in aviation so that wind speeds and directions at various levels are part of daily forecasts. The merging of hydrodynamics and aerodynamics is to be noted as a striking gain of recent work on hydroplanes and flying boats.

**Physical Instruments.** The new English *Journal of Scientific Instruments* is issued by the Institute of Physics in coöperation with the National Physical Laboratory. Science is recognizing the basic importance of instrument design and construction. Instruments make possible discoveries which could otherwise never be made. They accelerate, sometimes hundreds of times, the rate of gathering precise data. We may soon expect some physicist to do science the great service of writing a stimulating account of the place of the instrument in physics. This would doubtless inspire scientists and instrument makers alike in the production of new types of apparatus for experimental use. The *Journal of the Optical Society of America* has established an instrument section and added to its name the words "Scientific Instrument Review." Hitherto *Instrumentenkunde* has held the field unrivaled. America, now in the instrument field in full earnest, will surely take a high place in developing not merely new technical, but new scientific instruments as well, designed and built upon the most advanced scientific data and theory.

**Precision Measurements.** The use of interferometry in the production and testing of high precision shop gauges is an example in point, and on the horizon looms the "ultra-micrometer" of Wheddington and its improvement in America so that it will indicate lengths as slight as one billionth of an inch. Coblentz has greatly improved the sensitiveness of his star-heat apparatus which he expects will respond to the heat of a candle at a distance of 500 miles.

Extensometers of the most varied types and of high sensitivity have been developed. These are being applied to researches on materials and structures and the stress strain relations under loads. In optics the newer types of prisms are being applied to new uses, for example, the solid right angle prism, whose opposite face is an equilateral triangle, has interesting optical properties used in the War. The pentaprism and others are being applied in range finders while lenses, optical flats, and parallels are being developed in great variety for physical instruments.

Instrument making has at last arrived in

America, and American ingenuity is already in evidence in the later catalogues. Examples may be found in almost every branch of physics and applications in almost every branch of industry. In fact, the present tendency toward the completely measured control of industrial processes is almost without a parallel. Temperature and heat controls are now established in scores of industries. In many cases high temperatures are maintained automatically at predetermined values. The combustion of fuel is now automatically regulated in modern steam plants by means of apparatus which continuously and automatically corrects the admixture of air so that the CO content in the flue gases is kept at an optimum percentage.

These are examples of the instruments of the physicist becoming the tools of industry. Applied science is rapidly transferring the methods and principles and apparatus of the physicist into control instruments for the measured guidance of each part of the industrial process. In electricity the advance from the laboratory to practical uses has been rapid and steadily increasing. Electrical devices in endless variety are being developed for regulating the production, distribution, and utilization of heat, light, and power. Light buoys are being electrically equipped with selenium cells so that when the sky reaches a prescribed minimum brightness the buoy is lit automatically. Automatic heat control and humidity control are being extended to almost all kinds of manufacturing operations. The indoor atmosphere of schools and theatres is being conditioned by devices first used in the conduct of physical research.

Airplane engines are tested in altitude chambers where the conditions of high altitudes are duplicated. Testing laboratories are equipped with standard rooms having prescribed humidity and temperature so that the results may be comparable and standard. The vacuum tube has developed into a powerful engineering tool capable of sending messages to all parts of the world. In short, the variety of scientific devices developed by the physicist and transplanted to the industries is too great to enumerate. The scientific journals and the latest instrument catalogues must be consulted for details which cannot be touched in this general survey.

A new era in astronomical research begins with the completion of the 100-inch reflecting telescope of the Mt. Wilson Solar Observatory. This wonderful instrument is uniquely adapted for work in the fields of faint nebula, spectra of faint stars, structure of stellar clusters, and the variation of faint new stars. The focal length, 42 feet, has a maximum error of 0.14 mm., or about one part in 90,000. The enlargement of the perceptible universe and the vast fields of research thus opened up by this 100-inch telescope make the event an epoch-making one.

**Aëronautics Research.** A most important and interesting development of applied physics in connection with lift, drift, and resistance of airfoils, is the midjet wind tunnel consisting of a completely enclosed cylindrical tank with hemispherical ends. In this airtight tank, the air is drawn through an inner cylinder, returning outside the inner cylinder. By maintaining a pressure within the tunnel at 20 atmospheres, small-sized models give directly the results of a full-sized plane without scale corrections. This ingenious research shows the value of mathematical physics and the theory of

similitude. At the other extreme of wind-tunnel physics is the giant wind tunnel at Issy, the fan of which is 20 feet in diameter. The tunnel measures 110 feet in length. The laws of aerodynamics have thus received accessions of an astonishing character, an important example being an American wind tunnel which gives air-speeds of 1000 miles an hour. In the latter the experts of the United States Bureau of Standards have studied the relative motion of the air and projectile with the projectile at rest.

As hydrodynamics and aerodynamics have merged in the hydroplane and the flying boat, so the internal-combustion motor may be fairly regarded as a large-calibre machine gun shooting the piston with a momentum which is promptly translated into traverse of aircraft. The problem of the helicopter is in like manner becoming assimilated to the circling of a plane with excellent prospects of yielding to ingenuity and careful application of physical principles.

**Energetics.** The importance of "available energy" is stressed by Lotka in a study of the energetics of evolution. He refers to Boltzmann's principle that the fundamental objective contention in the life struggle in the evolution of the organic world is available energy. The advantage in the struggle goes to those whose energy-capturing devices are most efficient in directing available energy into channels favorable to the preservation of the species. Intra-atomic energy, which is now well measured, and vast, is accepted by physics as a fact of profound significance for future experiment. Sober physicists discuss the possibility of its release for use by man.

The feeling seems to be growing that the reaction by which four hydrogen atoms detonate into one helium atom may be caused to proceed, and once started might be made continuous, much as the combustion of coal in a furnace. The weight of four gramatoms of hydrogen exceeds that of helium by three centigrams, corresponding according to the Einstein formula, to the liberation of  $7 \times 10^{12}$  calories. Harkins remarks that "the energy produced in this way would be of great importance if the reaction could be made to proceed, since one pound of hydrogen would give, if converted into helium, as much heat as 10,000 tons of coal." It is wise to face the possibility of success in this direction. Certainly with the concept of critical frequencies in photochemical reactions, the problem assumes the aspect rather of inciting exothermic combination of hydrogen molecules or atoms.

Foote, who has done so much valuable work on disrupting potentials, has discussed in a semi-popular lecture the subject of the alchemist. He pictures the success of the atomist transmuting the elements, pointing out that the production of gold from mercury on a commercial scale would cause an overturn of our entire monetary system. To the scientist, however, this is less important than the control of atomic structure in general. It is not easy to exaggerate the possible results of the discovery of the technique of nuclear formation and the addition or subtraction of electrons at will. It clearly presages the possibility of creating forms of matter and energy having any desired properties.

Wignall and Knox have written *Atoms*, a novel dealing with the release of subatomic en-

ergy, a straw showing the direction of current thought. The fact that subatomic releases of energy, for example, are actually observable in the phenomena of radioactive atoms and perhaps in the helium-hydrogen reactions of variable stars, kindles the scientific imagination. Young experimenters, who to-morrow will hold the field, have already grasped the possibilities and we may confidently expect a recrudescence of the zeal of the alchemist which made modern chemistry.

Physics was so productive in the 10-year period under review that only a few of the more important researches can even be named. It could be spoken of as almost the golden age of the physicist with the super forces and mechanisms at his command. The immediate future presages discoveries of the most far-reaching consequences. Fortunate is that physicist who sees with high and far vision the inspiring view of the recreation of the world by the sciences touching the single cosmic essence which we call energy, the tangible aspect of which we call matter.

The literature on the new physics is growing so rapidly that any list would be out of date before reaching the reader. For the latest books in this prolific field the reader may consult the current numbers of *Science*, *Nature*, and *Science Progress*. See CHEMISTRY; CHEMISTRY, PHYSICAL.

**PHYSIOLOGICAL CHEMISTRY.** See BIO-CHEMISTRY; FOOD AND NUTRITION.

**PIAVE RIVER.** See WAR IN EUROPE, *Italian Front*.

**PICARDY, BATTLES IN.** See WAR IN EUROPE, *Western Front*.

**PICCIRILLI, ATTILIO** (1868- ). An Italian sculptor (see VOL. XVIII). He designed the war memorial for the city of Albany, 1923. He was awarded a gold medal at the Panama-Pacific Exposition in 1915, and the Widener Gold Medal, the Pennsylvania Academy of Fine Arts, 1917. His brother Furio (see VOL. XVIII) in 1920 executed the entire sculptural decoration of the Parliament House at Winnipeg, Canada, including a superb seated statue of Pierre Gautier de la Varrenne.

**PICKETING.** In 1914, the Congress of the United States passed the Clayton Act which, among other things, provided that no restraining order may be granted by any Federal court or judge to prohibit labor, singly or in concert, from peacefully persuading others to work or to stop work or from attending any place where they may lawfully be. Labor regarded this as the opening of a new era in which the right of peaceful picketing would become generally recognized and accepted.

Prior to 1914, there were laws in only two States—Alabama and Colorado—making picketing a misdemeanor. Beginning with 1915, however, several States took vigorous action. Washington enacted a law making picketing a misdemeanor. Texas followed with a sweeping Act which provided that any one who in conversation or otherwise with a person engaged in transport and commerce, or with any member of his family, at work or at home, attempts to cause him to desist from work through fear of violence is deemed guilty of intimidation. A Nebraska law made practically any form of picketing unlawful, including persistent communication with a man's family. Hawaii also

enacted a strict law against picketing. Utah, in 1923, passed a law against use of force, threats, intimidation or violence but an earlier law of 1917, limiting injunctions, forbids any injunction from interfering with peaceful persuasion. Wisconsin, in 1923, liberalized a law against picketing, which involved intimidation, by specifically allowing peaceful persuasion to be carried on outside the working premises during the strike or lockout.

Meanwhile, picketing cases found their way frequently into the courts. In some States all picketing was condemned, as in Oregon and Washington decisions of 1917. In other States, the right of peaceful picketing was held to be lawful, as in Arizona, Indiana, Minnesota and Montana decisions of 1916 and 1917. However, not only in directly deciding against picketing but also in indirectly limiting its practice through definition, the courts have as a general thing "gone against labor."

In 1922, the United States Supreme Court, in *American Steel Foundry v. Tri-City Central Trades Council*, upheld the provisions of the Clayton Act permitting peaceful persuasion but attempted to draw the line between legal and illegal acts in a way that would considerably limit picketing.

The most sweeping blow that was struck at picketing during the decade was the injunction secured in 1922, and made permanent in 1923 by the Federal court in Chicago, against the Railway Shop Crafts strike. The Attorney General brought this action on behalf of the United States on the ground of protecting the United States mails and interstate commerce. Although the Clayton Act authorizes peaceful persuasion, nevertheless this injunction, in addition to the customary prohibition of violence, intimidation and unlawful picketing, restrains peaceful picketing and persuasion, argument and entreaties, newspaper interviews and the use of union funds "in aid of or to promote or encourage the doing of any of the matters or things hereinbefore restrained and enjoined." The terms of this injunction against picketing, however, drew vigorous criticisms in decisions of other Federal courts in cases arising out of the railway shopmen's strike, particularly in Montana and North Dakota, where the full right of peaceful persuasion was reaffirmed.

**PICKFORD, MARY** (MRS. DOUGLAS FAIRBANKS) (1893- ). An American actress, born in Toronto. She made her stage debut at the age of five and her first marked moving-picture success in *Hearts Adrift*. She returned to the stage in *A Good Little Devil* and then devoted herself to the screen. Among her successes are *Tess of the Storm Country*, *Cinderella*, *Fanchon-Cricket*, *Madame Butterfly*, *The Bishop's Carriage*, and *Rosita*. Shortly before the War and for the succeeding years she has been one of the most popular screen actresses in the United States.

**PICK-MANGIAGALLI, RICCARDO** (1882- ). An Italian composer, born at Strakowitz, Bohemia. He was trained at the Milan Conservatory under Appiani (piano) and Ferroni (composition). His earliest works were written under the influence of Wagner and Strauss, especially in regard to the handling of the orchestra. Later the influence of the French impressionists makes itself felt. His most important works are the ballets, *Il Salice d'Oro* (Milan, 1914), *Il Carillon Magico* (ib., 1918;

New York, 1920), *Mahit* (ib., 1923), and *Sumitra*; a symphonic poem, *Sortilegi*; *Nortturno e Rondo Fantastico* and two preludes, for orchestra; a string quartet; and several pieces for piano. An opera, *Baci e Botte*, was completed in 1920 but was not yet produced in 1924.

**PICRIC ACID EXPLOSIVES.** See EXPLOSIVES.

**PIERCE, GEORGE WASHINGTON** (1872- ). An American physicist, born at Webberville, Texas, and educated at the University of Texas, Harvard and Leipzig. In 1903 he became instructor in physics at Harvard and in 1917 full professor of physics and director of the Cruft Laboratory. During the War he conducted experiments at the Naval Experimental Station at New London, Conn. Among his more important researches were those connected with his experiments in resonance in wireless telegraph circuits and crystal rectifiers for electric currents and electric oscillations. In addition to many papers contributed to various scientific publications he is author of *The Principles of Wireless Telegraphy* (1910) and *Electric Oscillations and Electric Waves* (1919).

**PIGMENTS.** See LEAD.

**PIKE, FRANK HENRY** (1876- ). An American physiologist, born at Aurora, Ill. He was educated at the University of Indiana and at the University of Chicago. He was instructor in physiology (1907-11) at the University of Chicago and assistant professor of physiology (1911-16) and associate professor (1916- ) at Columbia University. Professor Pike published numerous articles on general physiology, on the eyes of Cuban cave shrimps, and on heredity.

**PILES.** See FOUNDATIONS.

**PILOT CABLE.** See NAVIGATION.

**PILSUDSKI, JOSEPH** (?- ). A Polish general and administrator, born in Lithuania, and educated at Kharkov University. He became a socialist, and in 1885, because of a false accusation of complicity in an attempt to assassinate Alexander III, he was banished. In 1893 he returned to Poland and helped to found the Polish Society party. At the beginning of the War, Pilsudski secretly formed the "Polish military organization" which was used in the struggle to free Poland from Russia and the Central Powers. In 1916 he resigned from the Polish army because of trouble with the Austrian commanders and was later arrested by the Germans and imprisoned at Magdeburg. When he returned to Poland in 1918, he found the government very weak, and on November 14 the Council of Regency abdicated. Pilsudski, backed by his army, then held supreme power. During 1919, the year in which Paderewski became prime minister, Pilsudski was engaged in wars with the Ukrainians, the Czecho-Slovaks, and the Bolsheviks. The last, although they came within 12 miles of Warsaw, retreated in disorder in the face of a violent counteroffensive led by Pilsudski. In 1919 he was elected to the office of president, which he held till December, 1922. See POLAND, *History*.

**PILTDOWN MAN.** See MAN, PREHISTORIC RACES OF.

**PINCHOT, GIFFORD** (1865- ). An American forester and public official (see Vol. XVIII). In 1920 he was appointed Commissioner of Forestry of Pennsylvania. He was nominated for governor in May, 1922, by the Progressive wing of the Republican party in the

State and was elected in the following November. He was inaugurated as governor in 1923. During the threatened anthracite coal miners' strike in 1923, Governor Pinchot drew up a plan of settlement which was accepted both by miners and employers. During the early part of 1923 he took an aggressive stand in regard to prohibition enforcement and severely criticized President Coolidge and the administration for alleged laxity in the enforcement of the law. Later in that year he undertook to bring about an investigation of the prohibition enforcement bureau of the Treasury Department through a Senatorial committee which was engaged in investigating other activities of that Department. He was defeated as delegate to the Republican National Convention in May, 1924.

**PINK BOLLWORM.** See ENTOMOLOGY, ECONOMIC.

**PINTNER, RUDOLF** (1884- ). An American psychologist, born at Lytham, England, and educated at the Edinburgh University and the University of Leipzig. In 1912 he removed to the United States and was for several years on the faculty of the Ohio State University. In 1921 he was professor of education at Teachers' College, Columbia University. He was the author of several books on psychology, including *The Picture Completion Test* (1917) and *A Mental Survey* (1918). He also translated several books on psychology.

**PIRANDELLO, LUIGI** (1867- ). An Italian author, born in Girgenti, well-known in the United States as a playwright. His *Six Characters in Search of an Author*, played in New York in 1922, provoked much warm comment. In this play he uses the most terrible of human emotions as his material and at the same time reveals æsthetic theories concerning the material of art. He turns to life for his first inspiration, struggles in his works with the problem of personality, and strives to find the borderline between reality and fiction. His *Floriani's Wife* was played at the Greenwich Village Theatre in 1923. He is also the author of novels, among them *The Late Mattia Pascal*.

**PIRQUET, FREIHERR CLEMENS, BARON VON** (1874- ). An Austrian pediatricist (see Vol. VXIII). During the War, von Pirquet devised a new notation for nutrition, intended to improve on the calory. The unit is termed the *nem*, representing a cubic centimeter of mother's milk. He published *System der Ernährung* in 1917, with an addendum in 1920, devoted to this idea. In 1922 appeared in English *An Outline of the Pirquet System of Nutrition*.

**PIRRIE, WILLIAM JAMES, first BARON** (1847-1924). An Irish shipbuilder (see Vol. XVIII). During the War he was of valuable service to the British government as commercial adviser to Lord Derby, and in March, 1918, he was appointed Controller General of Merchant Shipping. When the North of Ireland was separated from the new Irish Free State, he was one of the first senators elected to the Parliament at Belfast (1922). Lord Pirrie was created a viscount in 1921 and died suddenly on May 7, 1924, on his way to New York City.

**PITT, PERCY** (1870- ). An English conductor and composer, born in London. He studied under Reinecke and Jadassohn at the Leipzig Conservatory (1886-88) and under Rheinberger at the Akademie der Tonkunst in Munich. In 1896 he was appointed organist at Queen's Hall; in 1902, coach at Covent Garden; in 1906, assistant conductor; and after Messenger's resignation (1907), principal conductor, a post which he filled until 1914. In 1920 he became principal conductor of the British National Opera Company. His works include a symphony; *Le Sang des Crépules*, symphonic poem; *Anactoria*, a symphonic poem for viola and orchestra; *Ballade*, for violin and orchestra; an overture, *The Taming of the Shrew*; *English Rhapsody*, *Oriental Rhapsody*, *Fêtes Galantes*, *Cinderella*, *Dance Rhythms*, *Coronation March*, for orchestra; incidental music to Phillips' *Paolo and Francesca*, Austin's *Flodden Field*, and Shakespeare's *Richard II*; *Hohenlinden*, ballad for male chorus and orchestra; *Swerving the Saxon*, cantata; *Sakura*, ballet-pantomime; and chamber music, piano pieces and songs.

**PITTMAN ACT.** See SILVER.

**PITTSBURGH.** A city of Pennsylvania. The population increased from 533,905 in 1910 to 594,297 in 1920, to 625,915 by the estimate of the Bureau of the Census for 1924. The population of the metropolitan district of which Pittsburgh is the centre was 1,207,504 in 1924. The area of the city was increased by the annexation of Spring Garden in 1920 and Chartiers in 1921. In 1919 the city voted \$21,996,000 for municipal improvements, as follows: highways, including the Boulevard of the Allies overlooking the Monongahela River, \$9,579,000; subway, \$6,000,000; parks and recreation grounds, \$1,815,000; waterworks, \$1,401,000; sewerage systems, \$1,341,000; public health, safety, and charities, \$1,110,000; highway bridges, \$750,000. In 1919, a new bridge across the Allegheny River was designed to meet the requirements of the War Department and was completed in 1923. It comprised three steel arch-truss spans, 229 feet, 437 feet and 229 feet respectively in length. After investigation of the rapid transit conditions in Pittsburgh, the city transit commissioner in his report of 1917 recommended two projects. The first was to connect the South Side district with the East End, chiefly by elevated tracks, a distance of 7.28 miles, at an estimated cost of about \$7,000,000; the second to connect the North Side with the East End, mostly by subway and tunnel at a cost of about \$11,000,000. A twin tunnel, known as the Liberty Tunnels, 5700 feet long, extending under Mt. Washington and connecting the South Hills district with the business section of the city, was completed in 1923 at a cost of nearly \$5,000,000. A zoning ordinance was passed in 1923. A bill passed by the State Legislature in 1923 authorized the appointment of a commission to study the creation of a metropolitan district in Allegheny County. The Schenley high school, accommodating 2000 pupils, was completed in 1916 at a cost of \$1,500,000. Other large high school buildings recently completed were Langley high school, South Hills high school and Westinghouse high school. Peabody high school was greatly en-

larged. The Carnegie Library grew from 418,698 volumes in 1914 to 536,975 volumes in 1924. A business-district branch was opened in the City-County Building in 1924 to accommodate the business section of the city. Pittsburgh manufactures annually products worth \$2,500,000,000. Bank clearings rose from less than \$3,000,000,000 in 1914 to \$8,212,798,000 in 1923.

**PITTSBURGH, UNIVERSITY OF.** An institution at Pittsburgh, Pa., founded in 1787. With the exception of the war years, the university increased its enrollment with great rapidity between 1914 and 1922-23; from 2830 in the former year to 7786 in the latter. The faculty was increased during the same period from 329 to 585 members, and the library from 20,000 to 85,000 volumes. The income of the university also increased from \$452,055 in 1914 to \$1,437,333 in 1922-23. Alumni Hall was built through gifts of the alumni in 1920. John Gabbert Bowman, LL.D., succeeded Samuel Black McCormick, D.D., LL.D., as chancellor in 1921.

**PIUS XI (ACHILLE RATTI), POPE** (1857- ). He was born in Desio, Italy, and studied at the diocesan seminaries and at the Lombard College of Rome, where he obtained a doctor's degree in theosophy, theology, and common law. He was ordained priest in 1879. From 1882 to 1888 he was professor of dogmatic theology and sacred eloquence in the seminary of his diocese. He afterward joined the staff of the Ambrosian Library, of which he became head in 1907. Four years later he was appointed assistant prefect of the Vatican Library and prefect in 1913. He was sent to Poland as Apostolic Visitor in 1918 and in the following year became Papal Nuncio. He was created Archbishop of Lepanto in 1919 and was transferred to the Archdiocese of Milan as Cardinal Archbishop in 1921. Following the death of Benedict XV, he was elected by the College of Cardinals as his successor and was crowned on Feb. 12, 1922.

**PIZZETTI, ILDEBRANDO** (1880- ). An Italian composer, born at Parma, Italy. After receiving his first instruction from his father he entered the Parma Conservatory in 1895 and graduated with honors in 1901. In 1909-18 he taught composition at the Istituto Musicale in Florence, when he succeeded Tacchinardi as director. In 1924 he was called to succeed Galignani as director of the Milan Conservatory. He wrote the operas, *Giulietta e Romeo*, *Le Cid*, and *Debora e Jaële* (Milan, 1922); incidental music to Sophocles's *Edipo Rè* and d'Annunzio's *La Nave*, *Fedra*, and *La Pisanella*; a *Requiem* in memory of King Humbert; *Poema Emiliano*; *Overtura per una Farsa Tragica*; *Sinfonia del Fuoco*; *Lamento* for tenor and orchestra; a violin sonata, a cello sonata, and a string quartet; and piano pieces and songs. He also wrote many essays for various periodicals, a biography of Bellini (1916), and *Intermezzi Critici* (1921).

**PLAGUE.** See BUBONIC PLAGUE; INFLUENZA.

**PLANCK, MAX** (1858- ). A German physicist (see VOL. XVIII). He received the Nobel Prize for physics in 1919. His later publications include *Vorlesungen über Thermodynamik* (1921) and *Vorlesungen über die Theorie der Wärmestrahlung* (1921).
